Date: 16.09.2019

To

Dr. SENTHIL , M.S Ortho
Managing Director,
No.100 ft, Perpenkulam St,
Manjukupam,
Cuddalore – 607001.

Dear Sir,

Sub: Request for Hospital visit for First MBBS – Reg.

As a part of the curriculum for MBBS Course , Sri Lakshmi Narayana institute of Medical Sciences & Hospital (BIHER) Puducherry , first year MBBS students have to undergo Hospital visit requirement. Students will be attending in batches in your esteemed orthopaedics care and management hospital.

Hence I kindly request you to grant permission to do the Hospital visit program at your Veludaiyaar Hospital , Cuddalore from 23th 24th 25th September 2019 in 3 batches. Kindly do the needful.

I am looking forward for your positive reply in this regard.

Thanking You

With regards

Dr. G. JAYALAKSHMI, BSC, MBBS, DTCO, M.D.,
DEAN

Sri Lakshmi Narayana Institute of Medical Sciences
Osudu, Ageram Kudapakkam, Post,

STUDENTS HOSPITAL VISIT REPORT- VELUDAIYAAN HOSPITAL (ORTHO CARE MANAGEMENT)

The First Year MBBS students , Sri Lakshmi Narayana Institute of Medical Sciences, BIHER , Pondicherry-605502. Were visited the following system in the Veludaiyaan hospital on 23rd , 24th & 25th September 2019.

Orthopedics is a branch of medicine that focuses on the care of the musculoskeletal system. This system is made up of muscles and bones, as well as joints, ligaments, and tendons. Orthopedists use both surgical and nonsurgical approaches to treat a variety of musculoskeletal issues, such as sports injuries, joint pain, and back problems. Orthopedics is a branch of medicine that focuses on the care of the skeletal system and its interconnecting parts. These parts include the:

- bones
- muscles
- joints
- tendons
- ligaments

Detailed information about Veludaiyaan hospital

An orthopedist often works as part of a larger orthopedic treatment team. This team may include: 1. physician assistants, 2. nurse practitioners, 3. occupational and physical therapists, 4. athletic trainers

Orthopedists treat a wide variety of musculoskeletal conditions. These conditions may be present from birth, or they may occur as a result of injury or age-related wear and tear.

Below are some of the most common conditions that an orthopedist may treat:

- joint pain from arthritis
- bone fractures
- soft tissue (muscle, tendon, and ligament) injuries
- back pain
- neck pain
- shoulder pain and problems, such as bursitis
- carpal tunnel syndrome
- overuse and sports injuries, including tendinitis, meniscus tears, and anterior cruciate ligament (ACL) tears
- congenital conditions, such as clubfoot and scoliosis

In order to help diagnose a person's condition, the orthopedist will:

- ask about the person's symptoms
- review the person's medical record to gather more information about their medical history and overall health
- carry out a physical examination
- review any X-rays conducted before the appointment

The orthopedist may also order additional diagnostic tests. These may include:

- an MRI scan
- a CT scan
- a bone scan
- an ultrasound
- nerve conduction studies
- blood tests

Types of orthopedic practices

An orthopedist may specialize in a particular branch of orthopedic medicine. These branches are called subspecialties.

Some orthopedic subspecialties include:

- hand and upper extremity
- foot and ankle
- musculoskeletal oncology (tumor)
- pediatric orthopedics
- sports medicine
- spine surgery
- trauma surgery
- joint replacement surgery

The sections below look at some surgical procedures that an orthopedist may perform as part of their work.

Total joint replacement

A total joint replacement (TJR), or arthroplasty, is a surgical procedure that replaces the damaged joint with a prosthesis, which usually consists of some combination of metal and plastic. TJR surgery is one of the most commonly performed elective surgeries in the United States.

Arthroscopic surgery

Arthroscopic surgery is a minimally invasive procedure that uses a device called an arthroscope to diagnose joint problems.

An arthroscope is a long, thin camera that an orthopedic surgeon will insert into a person's joint, most commonly the knee or shoulder. The camera is connected to a video monitor that allows them to see the inside of the joint.

By making small additional incisions, the surgeon can use a number of small, thin instruments to fix a wide variety of problems.

Arthroscopic surgery of the knee is the most common type of orthopedic surgery performed in the U.S. An orthopedist may perform arthroscopic surgery to repair common joint injuries, such as meniscus tears, ACL tears, and rotator cuff tears.

Fracture repair surgery

Sometimes, an orthopedic surgeon needs to perform an operation to repair a more severely broken bone. To stabilize the bone, they can use a number of different types of implants. These include rods, plates, screws, and wires.

Bone grafting surgery

In bone grafting surgery, an orthopedic surgeon uses bone from elsewhere in the body to repair and strengthen diseased or damaged bones.

They may also source this bone from another person.

Spinal fusion

Spinal fusion is a surgical procedure that fuses together adjoining vertebrae of the spine. This procedure allows the vertebrae to heal into a single, solid mass of bone.

An orthopedic spine surgeon may perform a spinal fusion for a number of back and neck problems, including injuries to the vertebrae or intervertebral disks and scoliosis.
