

OFFICE OF THE DEAN

# Sri Lakshmi Narayana Institute of Medical Sciences

OSUDU, AGARAM VILLAGE, VILLIANUR COMMUNE, KUDAPAKKAM POST,

PUDUCHERRY - 605 502.

[ Recognised by Medical Council of India, Ministry of Health letter No. U/12012/249/2005-ME ( P -II ) dt. 11/07/2011 ]

[ Affiliated to BIHER Chennai - TN ]

Ref.No. 35/SLIMS/ 2019

Date: 02.10.2019

To

Dr. Kavitha, MD  
Managing Director  
Kapila Medical Centre,  
7&8 MAC Avenue, Semmandalam,  
Cuddalore – 607001.

Dear Sir,

SUB: Request for Hospital Visit for II- MBBS - reg

As a part of the curriculum for MBBS Course, Sri lakshmi Narayana institute of Medical Sciences & Hospital (BIHER) Puducherry , Second year students have to undergo Hospital Visit requirement. Students will be attending in batches in your esteemed Kapila Medical Centre.

Hence I kindly request you to grant permission to do the program at your Kapila Medical Centre, Cuddalore from October 21<sup>st</sup> , 22<sup>nd</sup> , 23<sup>rd</sup> 2019 in 3 batches. Kindly do the needful.

I am looking forward for your positive reply in this regard.

Thanking You

Enclosure:

- List of 159 Students from SLIMS
- 1-92(1 Batch) 21<sup>st</sup> October 2019
- 92-184 (2 Batch) 22<sup>nd</sup> October 2019
- 185-276(3 Batch) 23<sup>rd</sup> October 2019

With regards  
DEAN  
Prof.K.BALAGURUNATHAN.M.S  
(General surgeon)  
SRI LAKSHMI NARAYANA

No 7.8, MAC Avenue,  
Nellikuppam Main Road,  
CUDDALORE - 607 001.

# Kapila Medical Center

Diabetes is a chronic illness that requires continuing medical care and patient self – management education to prevent acute complications and to reduce the risk of long-term complications. Diabetes care is complex and requires that many issues, beyond glycemic control, be addressed. A large body of evidence exists that supports a range of intervention CLASSIFICATION, DIAGNOSIS, AND SCREENING

## Classification

The classification of diabetes mellitus includes four clinical classes:

- Type 1 diabetes (results from  $\beta$ -cell destruction, usually leading to absolute insulin deficiency).
- Type 2 diabetes (results from a progressive insulin secretory defect on the background of insulin resistance).
- Other specific types of diabetes (due to other causes, e.g., genetic defects in  $\beta$ -cell function, genetic defects in insulin action, diseases of the exocrine pancreas, drug or chemical induced).
- Gestational diabetes mellitus (GDM) (diagnosed during pregnancy).

## Diagnosis

Criteria for the diagnosis of diabetes in nonpregnant adults are shown in Table 2. Three ways to diagnose diabetes are available, and each must be confirmed on a subsequent day unless unequivocal symptoms of hyperglycemia are present. Although the 75-g oral glucose tolerance test (OGTT) is more sensitive and modestly more specific than fasting plasma glucose (FPG) to diagnose diabetes, it is poorly reproducible and rarely performed in practice. Because of ease of use, acceptability to patients, and lower cost, the FPG is the preferred screening and diagnostic test. It should be noted that the vast majority of people who meet diagnostic criteria for diabetes by OGTT, but not by FPG, will have an A1C value <7.0%.

Hyperglycemia not sufficient to meet the diagnostic criteria for diabetes is categorized as either impaired fasting glucose (IFG) or impaired glucose tolerance (IGT), depending on whether it is identified through FPG or an OGTT: IFG = FPG 110 mg/dl (6.1 mmol/l) to 125 mg/dl (6.9 mmol/l); IGT = 2-h plasma glucose 140 mg/dl (7.8 mmol/l) to 199 mg/dl (11.0 mmol/l).

Both categories, IFG and IGT, are risk factors for future diabetes and cardiovascular disease (CVD). Recently, IFG and IGT have been officially termed “pre-diabetes.” Recent studies have shown that modest weight loss and regular physical activity can reduce the rate of progression of IGT to type 2 diabetes (4,5,6). Drug therapy (metformin [6], acarbose [7], and orlistat [8]) and troglitazone (no longer clinically available) (9) have been shown to be effective in reducing progression to diabetes in single trials, though generally not as effective as intensive lifestyle interventions.

## Screening

Generally, people with type 1 diabetes present with acute symptoms of diabetes and markedly elevated blood glucose levels. Type 2 diabetes is frequently not diagnosed until complications appear, and approximately one-third of all people with diabetes may be undiagnosed. Although the burden of diabetes is well known, the natural history is well characterized, and there is good evidence for benefit from treating cases diagnosed in the context of usual clinical care, there are no randomized trials demonstrating the benefits of early diagnosis through screening of asymptomatic individuals (10). Nevertheless, there is sufficient indirect evidence to justify opportunistic screening in a clinical setting of individuals at high risk. Criteria for testing for diabetes in asymptomatic, undiagnosed adults are listed in Table 3. The recommended screening test for nonpregnant adults is the FPG. The OGTT is more sensitive for the diagnosis of diabetes and pre-diabetes, but is impractical and expensive as a screening procedure.

The incidence of type 2 diabetes in children and adolescents has increased dramatically in the last decade. Consistent with screening recommendations for adults, only children and youth at increased risk for the presence or the development of type 2 diabetes should be tested (11) (Table 4).

## Detection and diagnosis of GDM

Risk assessment for GDM should be undertaken at the first prenatal visit. Women with clinical characteristics consistent with a high risk for GDM (those with marked obesity, personal history of GDM, glycosuria, or a strong family history of diabetes) should undergo glucose testing as soon as possible (12). An FPG  $\geq 126$  mg/dl or a casual plasma glucose  $\geq 200$  mg/dl meets the threshold for the diagnosis of diabetes, if confirmed on a subsequent day. High-risk women not found to have GDM at the initial screening and average-risk women sh
