Abstract
Lycopersicon esculentum leaf-extract was utilized in the synthesis of zinc-oxide nanoparticles (Le-ZnO-NPs) using zinc acetate as the precursor. The synthesized ZnO-NPs were attested by the detection of a notable absorption peak at 343 nm, appearing in UV–Vis spectra due to surface-plasmon-resonance. The XRD-spectrum recorded at 2θ values coincides with that of lattice planes. HR-TEM results revealed that Le-ZnO-NPs exhibited a crystalline structure with hexagonal wurtzite shape (10–50 nm size). The effectiveness of inhibition of the microbial biofilms of Proteus vulgaris, Enterococcus faecalis and Candida albicans was analyzed at a concentration of 100 µg ml−1. Moreover, Le-ZnO-NPs showed a significant range of anti-coagulant activity, in contrast to commercial anti-coagulant (heparin). Cytotoxicity studies showed that Le-ZnO-NPs (100 µg ml−1) are non-toxic to murine macrophage cells, but toxic to human cervical cancer (HeLa) cells. Indeed, a reduction in the viability of HeLa-cells and a notable variation in the apoptotic cell structure were apparent. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

The first author, Mr. S. Vijayakumar (SRF), thanks the DST, New Delhi, India for financial support under INSPIRE programme (INSPIRE Fellow-IF140145). The authors thank the RUSA phase 2.0 grant [Ref-24-51-2014-U policy]TN Multi-Gen. Department of Education, Government of India.?We sincerely acknowledge the Department of Science and Technology, New Delhi, India for the financial support under PURSE 2nd phase (Order No: SR/PURSE phase 2/38 (G) dt:21.02.2017).?We thank Dr. Elisa Borghi (Assistant Professor Department of Health Sciences, University of Milan, Italy) for her comments on an earlier version of the manuscript. Mr. S. Vijayakumar acknowledges Mrs. Marry, Nurse, Govt. hospital, Karaikudi, Tamil Nadu, India for support in blood sample collection.

Saraswatarishta reverses neuronal injury in brain tissues of scopolamine-induced rat model
(2019) *Journal of the Anatomical Society of India*, 68 (4), pp. 269-273. Cited 1 time.

DOI: 10.4103/JASI.JASI_45_19

Abstract
Introduction: Neuroinflammation has been implicated in the pathogenesis or the progression of the variety of acute and chronic neurological and neurodegenerative disorders, including Alzheimer fs disease. The Saraswatarishta is an Ayurvedic medicine utilized in many health conditions such as anti.aging, to improve memory, immunity, and quality of semen and sperms to treat epilepsy and cosmetic use for skins. It is a liquid Ayurvedic medicine. Saraswatarishta contains 5%.10% of self.produced alcohol in it, which serves as a vehicle to deliver water. and alcohol-soluble active herbal components to the body. It is also called Sarasvatarishtam. The aim of this study was to find the possible neuroprotective role of Saraswatarishtam as a preventive Ayurveda and Siddha drug to hamper cholinergic dysfunctions and histopathological changes in scopolamine.treated rat model. Material and Methods: The compound Saraswatarishtam was obtained from standard Ayurvedic vendor at Chennai. Group 1-normal control animals received normal saline for 8 continuous days. Group 2 . positive control treated with scopolamine (0.4 mg/kg). Group 3-received 200 mg/kg of piracetam for 8 continuous days. Group 4 and Group 5 served as a test and received 200 mg/kg and 400 mg/kg of Saraswatarishtam, respectively, for 8 continuous days. On the 8th day, after 90 min of drug administration, Group 2, Group 3, Group 4 and Group 5, were treated with 0.4 mg/kg of scopolamine. Brain tissues were dissected out and analyzed for histopathological changes after sacrifice with high dose of halothane. Results: Administration of scopolamine produced marked focal gliosis with mononuclear infiltration. The hippocampal region showed neuronal degeneration with sclerosis. Piracetam treated group showed pyknotic nucleus in neurons of the cerebral cortex and mild edema. Low dose (200 mg/kg) treatment with Saraswatarishtam followed by scopolamine administration showed moderate histopathological changes such as mild infiltration of monocytes but normal neuronal architecture. High dose (400 mg/kg) treatment with Saraswatarishtam followed by scopolamine administration shows abnormal morphology of cerebrum, cerebellum, basal nuclei, and hippocampus. Discussion and Conclusion: The results of the present study suggested that Saraswatarishtam exhibits neuroprotective properties against scopolamine.induced neuronal damage. © 2020 Journal of the Anatomical Society of India.

Abstract
The paper addresses the problem of operated power transformers actual technical state identification by using existing technical diagnostics retrospective data. The initial data set was composed of results of transformer oil analysis, loading conditions, infrared snapshots and aggregated characteristics of the technical state of bushing, surge arrester and cooling system. Retrospective data of technical diagnostics was used. Technical state estimation process was divided on several steps and was performed by Python. First step was feature selection, where the features with low meaning in terms of the problem formulation are ejected. The second step is the processing of missing data to increase the dataset. KNN algorithm was used to restore missing values. The final step is learning transformer technical state classifier based on random forest tree approach. The results of power transformer state's classification demonstrated relatively high accuracy of identification.

Abstract
This paper proposes an improved Ant Colony Optimization (iACO) algorithm with improved search patterns using Fractional Brownian Motion for improving the exploitation capability. To improve the global convergence and to increase the energy efficiency using proposed iACO, Fractional Brownian Motion is used. This maintains a proper balance between the exploitation and exploration abilities using this motion and this limits the hardware requirement of routing. Additionally, the energy efficiency of the clustering protocol using iACO algorithm inherits the capabilities of attaining the optimal cluster head (CH) selection and further improves the energy efficiency. The results obtained through the simulator proves that the proposed iACO protocol performs well than the other known protocols in terms of its throughput, packet delivery ratio, and energy consumption. © 2019, Advanced Scientific Research. Abstract
The paper addresses the problem of short-Term renewable energy forecasting. The stochastic nature of renewable energy sources affects the power system planning procedures, subsequently reducing the reliability and security of power supply for final customers. The authors propose a machine learning approach for effective day-Ahead forecasting using retrospective metering data and open source weather information provided by meteorological services. The paper addresses the problem of feature identification and appropriate error metrics. For the purpose of effective testing the user interface was created and tested on the real solar power plant situated in southern region of Russian Federation. The mean forecasting accuracy was obtained to be about 93%. © 2019 IEEE.

Abstract
Background: Periodontal disease is one of the most prevalent oral diseases affecting the supporting tissues of the teeth, gingiva, periodontal ligament, cementum, and alveolar bone. Oxidative Stress plays an important role in the pathogenesis of periodontitis. Dietary supplementation of proanthocyanidin enhanced the host resistance as well as the inhibition of the biological and mechanical irritants involved in the onset of gingivitis and the progression of periodontal disease. Aim: The aim of the present study is to assess whether proanthocyanidins could exert protective as well as therapeutic effect on endotoxin induced experimental periodontitis in rats. Protective action of proanthocyanidins is investigated by assaying the free radicals, acute phase proteins, nonenzymatic antioxidants, in comparison with a standard antimicrobial agent 'tinidazole'. Materials and Methods: Experimental periodontitis was induced by injecting E.coli endotoxin. On the 10th day of endotoxin induction, the animals were divided into group,3and4 groups of 6 animals receiving 30mg proanthocyanidins (sc-sub cutaneously)/kg body weight for 30 days; and 20mg tinidazole (administered orally)/kg body weight for 30 days. After 30 days of treatment procedure, the animals were sacrificed blood was collected for Biochemical assay. Rat maxillae was dissected out for histo pathological evaluation. Results: Levels of free radicals, acute phase proteins and Nonenzymatic antioxidants were significantly increased in experimental periodontitis rats as compared to PC and tinidazole treated groups showed significant inhibition of reactive oxygen species and lipid peroxides (P< 0.001). Conclusion: Proanthocyanidin, has been shown to provide a significant anti-inflammatory effect on endotoxin (Escherichia coli) induced experimental periodontitis in rats and is a promising drug for treating periodontitis. © 2019, Research Journal of Pharmacy and Technology. Abstract
Sensors are gadgets, which can screen temperature, moistness, weight, commotion levels, setting mindfulness, lighting condition and identify speed, position, and size of an Object. Sensor information are getting accumulated in gigantic amount thus they are overseen utilizing NOSQL. The information will be gathered in an IOT cloud stage where it will be additionally prepared with machine learning methods for prescient examination. What's more, eventually with the required answer for the business structure will be created. This paper explain the proposed system for IoT data collection with AWS (Amazon Web Service) cloud platform. Various system components like Kinesis stream, M2M platform, Notification service and secured IoT service layout. The complete BMS system architecture is detailed in this paper. © BEIESP.

Abstract
This document reports on the experimental investigation of the features of the heat transfer performance of heat exchanging device with tape insert. The experimental investigation was carried out pipe a warped tape inserted with a proportion of 4.8. An experimental heat flow investigation analyzed using Al2O3 water-based Nanofluids was used in this work. The experiment was performed in a turbulent flow situation with a twisted tape of simple water and Nano liquids. Experimental data on plain water and nanofluid was drawn and these informations were used to correlate with plain water and nanofluid. Experimental data were generated with water and nano-fluid for Reynolds in the variety 110000–135460, Nu nanofluid based water. A heat flow features Al2O3 and simple stream were improved an augment Re. An experimental data nano fluid was increased by 2.89% compared to the experimental value of plain water. The findings of the inquiry indicate the performance improvement of the parameters of the heat exchanger, namely, the coefficient of heat flow augment by means of amount absorption of the nanoparticle compare with water. © TJPRC Pvt. Ltd.

Abstract

This paper investigates the effect of temperature and hybridization on the impact damage evolution and post-impact residual strength of hemp/epoxy, basalt/epoxy and their hybrid laminates, using mechanical and acoustic emission (AE) based analysis. To start with, the specimens were impacted by a drop weight impact tower machine at two temperatures of 30 °C and 65 °C and then they were subjected to a three-point bending test for the assessment of their residual strength, while online AE signals were recorded during the test. The mechanical behavior of the laminates was evaluated through measurement of the impact force and absorbed energy. AE response of the slope of cumulative rise angle (RA) was used for identification of the severity of the impact-induced damage in the laminates. In addition, the sentry function was computed on the basis of the correlation between the mechanical strain energy stored in the materials and the acoustic energy propagates by fracture events, enabled evaluation of the amount of impact-induced damage. These results showed the hybridized laminates having a better resistance to impact damage at the elevated temperature (65 °C) compared with the non-hybridized laminates, whereas, in the case of the ambient temperature (30 °C), basalt/epoxy laminates had a higher impact damage resistance than other configurations. This study reveals the capability of the proposed AE-based methods to investigate the effect of temperature and hybridization of composite laminates. © 2019 Elsevier Ltd

Author Keywords

Acoustic emission; Elevated temperature; Hybrid composites; Impact damage; Residual; Rise angle; Sentry function; Strength

Index Keywords

Acoustic emissions, Basalt, Damage detection, Drops, Hemp, Impact strength, Laminated composites, Paper laminates, Strain energy, Temperature; Elevated temperature, Hybrid composites, Impact damages, Residual, Rise angles, Strength; Acoustic emission testing

Abstract
The incorporation of Carbon in Tin Oxide (SnO2) nanocomposite (SnO2@C NCs) was synthesized successfully by hydrothermal method with sucrose and tin dichloride dihydrate (SnCl2.2H2O) as precursor materials and was sintered at different temperatures. The as prepared SnO2-Carbon nanocomposites were characterized by various techniques such as X-ray powder diffraction (XRD), Scanning electron microscopy (SEM) along with Energy dispersive X-ray (EDX), high resolution transmission electron microscopy (HR-TEM), Raman spectra, TGA and Electrochemical analyses. The controlled addition of Carbon in SnO2 to exhibit enhanced electrochemical property was also studied. It was demonstrated that the Carbon derived from sucrose assisted anode showed the high reversible capacity of about 581 mAhg-1 indicating that the possibility of further increment in Li storage property. The initial discharge capacities of the samples heat treated at 400 °C, 450 °C and 500 °C were 1424.79, 1061.71 and 531.28 mAh g-1, exhibiting an increasing trend in capacity with increasing the Carbon content. The columbic efficiency of SnO2@C NCs attains more than 95%. The electrodes show a long cycling ability and high charge and discharge capacity due to the presence of carbon. © 2019 Elsevier B.V.

Abstract
In this present work, bismuth molybdate (Bi2Mo2O9)nanoparticles (NPs)were prepared by microwave combustion method using urea as the fuel. The phase formation and purity of the product was identified by powder X-ray diffraction (XRD). Fourier transform-infrared (FT-IR)analysis was adopted to record the functional group of Bi2Mo2O9 NPs. The morphology, purity, size and elemental composition of the sample were confirmed by Scanning electron microscope (SEM), elemental mapping, energy dispersive X-ray (EDX)analysis and High-Resolution transmission electron microscope (HR-TEM)technique respectively. The UV–visible and photoluminescence (PL)spectra were used to examine optical and electronic behavior of the prepared sample at room temperature (RT). The chemical bonding of Bi2Mo2O9 NPs was studied by Raman spectroscopy. The magnetic properties of Bi2Mo2O9 NPs were examined by vibrating sample magnetometer (VSM)at RT. The particle size distribution was examined by X-ray Photoelectron spectroscopy (XPS). The Electrochemical (EC)properties of Bi2Mo2O9 NPs were investigated by Cyclic voltammetry (CV), Galvanostatic charge/discharge (GCD)and Electrochemical impedance spectral (EIS)studies. The specific capacitance (Cs)of prepared Bi2Mo2O9 NPs is 197 F/g at 0.4 A/g with excellent cycle stability of 94% specific capacitance after 1000 cycles. Hence, the results of electrochemical characteristics exhibits excellent performance and have potential application of electrode for energy storage systems. © 2019 Elsevier B.V.

Abstract
The experimental investigation of friction factor and heat transfer characteristics of double pipe heat exchanger using aluminum oxide water based nanofluid. In this present study the heat transfer from hot water to cold water of the double pipe heat exchanger for a plain tube was experimentally investigated. This investigation also to find the heat transfer coefficient, Nusselt number, and Reynolds number. The experimental value of plain tube with water and Al2O3 was obtained from the experimental work and these two statistical data were compared with the results. The results shows that the heat transfer rate enhancement of induced with the nanofluids water based flow has give more heat transfer compared to the plain water. The Reynolds numbers were varied in the range of 5000 to 18000. The data obtained from the experimental value were compared with CFD simulation analysis. The performance of heat transfer characteristics of aluminum oxide nanofluid was enhanced compared with smooth plain water used. The experimental value of the heat transfer and friction factor characteristics was well bonding with simulation value of CFD analysis. © Published under licence by IOP Publishing Ltd.

Abstract
Introduction: Drug-induced liver injury possesses a major clinical problem and has become a leading cause of acute liver failure and transplantation. Overstressed liver compromises its detoxification role, which may expose it to a variety of diseases and disorders. Aim: The aim of the study was to investigate the adverse effects of different doses of diclofenac sodium on liver and renal tissues by biochemical and histopathological findings. Materials and Methods: Twenty four albino male rats weighing 180-200 g were divided equally into four groups. In control group, rats were administrated with physiological saline 2 ml/kg b. wt/intramuscularly. In experimental groups, rats were administrated with different doses of diclofenac sodium (50, 75, and 100 mg/kg b. wt/intramuscularly/7 days). Results: Diclofenac treated groups showed a significant ($P < 0.001$) increase in aspirate amino transferase, alanine amino transferase, alkaline phosphatase, and total bilirubin, urea, and creatinine; however, a significant decrease ($P < 0.001$) in total protein in all the three diclofenac treated groups and also all the diclofenac groups show a significant increase ($P < 0.001$) in malondialdehyde on both liver and kidney; however, there was a significant ($P < 0.001$) decrease in glutathione level on both liver and kidney homogenates. Histopathological alterations were also observed in both liver and kidneys. No significant changes observed in control groups. Conclusion: Administration of different dose of diclofenac sodium induces severe adverse effects in liver and kidney.

Abstract
The use of animals for research has increased with increase in advancement of Research & Development in science. Year after year millions of animals are used for carrying out experiments. Since long time it has been a debating issue about the pain, distress and death underwent by the animals during scientific experiments. Beyond ethical considerations to carry out animal experiments, requirement of skilled man power, protocol which are time consuming and high cost are other disadvantages faced. Thus, to overcome these difficulties various alternatives to animal testing have been utilised. Reduction, Refinement and Replacement is applied for use of animals in laboratory. Various alternative methods and organisms are used to overcome the ethical issues and difficulties faced with use of animal experiments. This review is focused to elaborate an insight towards the use of alternative methods and their advantages over animal experimentation such that we can minimize the use of animals in scientific experiments. © RJPT All right reserved.

Abstract
Cloud is the one of the booming technology this era; cloud technology provides various storage services for the user, which is helpful on large amount of data maintenance and management.dd in this paper, we identify the issues of integrity auditing and storage security systems on cloud. Specially, seeking to achieve both auditing and storage in cloud in secure way, we are proposing a secure system, namely secClodud+ and using the dynamic data operation with portioning method the data are stored in the server. The performance of data storage and retrieval is securely done in proposed model. Implementation of the model is based on Improved Adaptive Huffman Technique that enables the access to the user to process the secure and efficient way of data. So that this improved Adaptive Huffman technique implements to store the data with the minimized time consumption, space and computational cost. © BEIESP.

Abstract
Stock price prediction is always a most challenging task. Artificial Neural Network prediction clears the stock price prediction challenge by forming the training set. By using the past information as the network input, one can predict the expected output of the network. In order to predict the expected result as the accurate we add multi-layer perceptron to the knowledge set we formed from the past historical data available in the nifty NSE and Sensex BSE. This paper proves that proposing the learning knowledge set using multilayer neural network will predict the accurate closing price of future stock in stock market.

Abstract
Video analysis plays a vital role in commercial application, sports and military systems. Various methods are presented in literature. Mean shift algorithm is presented in this paper for basket ball tracking because it is more efficient than other that is defined by histograms. The tracking is the important block in the detection and recognition of the basket ball. Different object tracking algorithms are investigated. The performance of tracking in two video sequences is performed and the method gives 91.3% precision for video sequence 1 and 93.6% for sequence 2. © BEIESP.

Genetic evolutionary learning fitness function (GELFF) for feature diagnosis to software fault prediction
(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (11 Special Issue), pp. 1151-1161.

DOI: 10.35940/ijitee.K1233.09811S19

[b] Computer Science Department, Govt. Arts College (Men), Nandanam, Chennai, India

Abstract
Nowadays, proper feature selection f+orFault prediction is very perplexing task. Improper feature selection may lead to bad result. To avoid this, there is a need to find the aridity of software fault. This is achieved by finding the fitness of the evolutionaryAlgorithmic function. In this paper, we finalize the Genetic evolutionarynature of our Feature set with the help of Fitness Function. Feature Selection is the objective of the prediction model tocreate the underlying process of generalized data. The wide range of data like fault dataset, need the better objective function is obtained by feature selection, ranking, elimination and construction. In this paper, we focus on finding the fitness of the machine learning function which is used in the diagnostics of fault in the software for the better classification. © BEIESP.

Abstract
In an effort to improve efficiency of heat exchanging device by means of induced tape inserts using titanium oxide Nanofluids is provided. The experimental study evaluated the fluid flow and heat transfer features of the turbulent water-based Nanofluids with a concentration of 0.6 per cent. Titanium oxide of nanoparticles with a diameter of 25 nm was used in this job. The information showed that the nano-fluid heat flow coefficient was slightly greater with base water a comparable mass flow and comparable temperature. A heat flow coefficient nano fluid rises by means of augment flow rate and amount of Reynolds rises with an rise in the heat transfer coefficient. The experiment performed heat double pipe Data were produced with distinct mass flow rates for both water and nano liquids. The amount of Reynolds ranges from 110000 to 135460. The increase in heat transfer was boosted with an increase in the amount of Reynolds. The heat transfer rate was increased by 12 per cent of nano-liquids compared to simple water. © BEIESP.

Abstract

Stress is psychologically debilitating and can have a deleterious effect on the academic performance. Dentistry has been widely acknowledged as being associated with high levels of stress. To find out the perceived sources of stress among dental students. 75 students, (15 from each year of study). A closed ended ten item questionnaire was used. Statistical analysis was done using Kruskal Wallis and Wilcoxon Mann Whitney test. Final years had high perceived level of stress. Females had more stress than males. Educational institutions and bodies governing the curriculum should try to reform the dental curriculum, to make it less taxing. © 2019, Advanced Scientific Research. All rights reserved.

Abstract
A heat flow and fluid flow investigation of double tube heat exchanger by means of warped tape insert under the mixing water based nano fluids. In this article Aluminium oxide and Titanium oxide was used to get better performance heat exchanging device. A different mass flow rate of fluids used to conduct the experiment and gathered various surface temperature for analyses the heat flow augmentation. A heat flow rate Nano fluids 10 to 12% was enhanced compare with the plain base water. A heat flow with liquid flow Aluminum oxide was enhanced with +8% compare with the plain base water. A heat transfer characteristics titanium oxide were augment with raise of Re and 12% was augmented compare with the plain water. However heat flow and liquid flow heat exchanging device was increasing with volume of Nano fluids increased and leading to friction factor. © BEIESP.

Abstract
Myristica Fragrans (Nutmeg) is one of the most important spices. MF was well-known for its aroma and therapeutic action. In India, Myristica Fragrans (MF) was commonly said to be Jatiphal, Jathikai and Javitri. It belongs to the family myristaceae. Myristica fragrans was used in a lot of industrial applications such as liqueurs, soap production and cosmetics. MF was reported for its improving memory, aphrosidiac,antioxidant, anti- inflammatory, anticollagenolytic properties. In our study, in MF was found to possess 66.7% polyphenolic content. © 2019, Advanced Scientific Research. All rights reserved.

Abstract
The word training relates to the development of knowledge, abilities and skills resulting fro the learning of abilities and knowledge related to particular helpful abilities2. Training has its own characteristics and it's used to increase the productivity both in terms of quality and quantity. The article examines the effect of training on the productivity of employees. This manuscript provides an examination of the present proof of such a connection and provides suggestions for further inquiry. A comprehensive review of the literature in terms of study results from studies that attempted to assess and determine the level of the productivity of employees. In this manuscript explain the impact and effectiveness of training in dairy industry and findings would clearly explain the impact level of a training programs3. © BEIESP.

Abstract
The Current study is concerned with “a study on effectiveness of training and development in its solutions (chennai)” in this study where the effectiveness of the employee are measured and studied. In this study the where 110 employees are taken out of 195 employees using random sampling method. Where the set of questions are given to the employees to get there feedback about the changes after the training. The organization provides various kind of training to the employee. In this study we are testing the effectiveness of the employee after the training and development3. Where the 110 questions are distributed to employees and answers are collected for findings, suggestions and conclusions. The answers given by the respondents are analysed using chi-square and percentage method. After the finding where concluded that the objectives of this study and conclusions found in this study meets same point. Where the objective of this study is get satisfied. In this study we found that there is significant difference in employee than before. The training imparted meets the objectives like2.

Abstract
Training plays a good part in this competitive globe in the qualified and business format. Training is the cornerstone that suffices the need for job functioning smoothly and smoothly, which also helps to enhance the quality of employee working lives and organizational development. Development is a method that contributes to the organization's qualitative as well as quantitative advances, particularly at the managerial level, is less regarded with strong abilities and is more worried with understanding, values, attitudes and behaviors in relation to particular abilities. Development can therefore be described as an ongoing process, while training has particular fields and goals. Training involves positive growth in such organizational intentions in order to optimize the quality of the workers ' working lives. These kinds of training and growth programs assist improve staff behavior and attitude towards the job as well as enhance their morality. Training and growth programs for employees are therefore significant elements that need to be studied and concentrated on. This article focuses and analyzes the results of the literature on the significance of induction training and growth in Cavinkarepvt ltd and their relationship with the sustainability of the staff. ©BEIESP.

Abstract
Colorectal carcinoma is one of the utmost diagnosed cancer with a steep increase in mortality rate. The incidence has been increasing in developing countries like India due to a westernization life style. Flavonoids have been explored widely for its various pharmacological activity including antitumor activity. Orientin, an analogue of luteolin (citrus flavonoid) isolated from rooibos and tulsi leaves is also expected to deliver significant antitumor activity similar to that of luteolin. The present study anticipates exploring the antitumor activity of orientin against colorectal carcinoma cells (HT29). Orientin exhibited remarkable cytotoxicity and antiproliferative activity against HT29 cells, which is clearly evident from tetrazolium based cytotoxicity and lactate dehydrogenase release assays. Orientin induce G0/G1 cell cycle arrest and regulates cyclin and cyclin-dependent protein kinases in order to prevent the entry of the cell cycle to the S phase. Annexin V-FITC (V-Fluorescein Isothiocyanate) dual staining reveals the apoptotic induction ability of orientin. The Bcl-2 family proteins along with the inhibitor of apoptotic proteins were regulated and the tumor suppressor p-53 expression have been decreased. In conclusion, our results proposed that orientin could be a potent chemotherapeutic agent against colorectal cancer after ascertaining their molecular mechanisms. © 2019 by the authors. Abstract
Cerium oxide (CeO2) thin films were deposited on Pt (111)/Ti/SiO2/Si(100) substrates using pulsed laser deposition method at different temperatures such as, 300 K, 573 K and 873 K with 3 × 10−2 mbar oxygen partial pressure. The prepared films were systematically investigated using X-ray diffraction (XRD), atomic force microscopy (AFM), photoluminescence (PL) and electrical measurement system. XRD analysis clearly showed improved crystallinity of CeO2 films prepared at 573 and 873 K substrate temperatures. The AFM analysis indicated the uniform distribution of the nanocrystallites and dense structure with the roughness (RMS) of ~ 2.1–3.6 nm. The PL studies of the films showed a broad peak at ~ 366–368 nm, indicating the optical bandgap of 3.37–3.38 eV. The electrical property study showed minimum leakage current density of 2.0 × 10−7 A/cm2 at 873 K, which was measured at 100 kV and this value was much lower than that of the CeO2 film deposited at 300 K. The dielectric constants are increased and dielectric loss values decreased for the films with increasing substrate temperature. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
The microcrystal structure of copper sulfide (CuS) nano-structured ultra-thin film was prepared on glass substrate from aqueous ammonia solution and sodium hydroxide at 60 °C using a simple and cost-effective chemical bath deposition (CBD). The powder X-ray diffraction method was used to characterize the hexagonal structure of the prepared CuS thin-film. While, surface morphology and surface topology were investigated by scanning electron microscopy (SEM) and atomic force microscopy (AFM). The optical properties were investigated by using UV–visible absorption spectrum. The electronic properties including average energy gap (Penn gap), Fermi energy, electronic polarizability and valence electron plasma energy of CuS thin films were determined. Semiconductor characterization of CuS film was confirmed using temperature dependent conductivity analysis. To prove the positive photoconductivity of nano-structured CuS nano-structured thin film, photoconductivity measurements were performed. I–V characteristics result, and Hall Effect measurements were also evaluated. Our results showed that the prepared CuS nano-structured thin films have higher crystallinity, purity and higher content of copper (Cu: 89.6%) as confirmed by XRD and EDX elemental analysis, respectively. While, their optical band gap energy is about 2.2 eV. Polarization-dependent Raman investigations allowed sample identification by dominant peaks at 265 cm−1 and 474 cm−1, proving the formation of CuS. Moreover, stimulating energy was found to be 0.028 eV by employing DC conductivity measurements. The estimated surface roughness was about (115 nm) with an average thickness of about (16.3 nm) as obtained from AFM analysis. Finally, remarkable smooth multi-colored marble like textural patterns have been recorded confirming the novel switching as recorded by the polarizing optical microscopy. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

The author, Dr. Kaushik Pal owe to his sincere thanks to his colleagues, including Bachelor/Masters students, spectroscopy/electron microscopy operators from Wuhan University, China. As well as entire team of researchers are also gratefully acknowledged in Chonbuk National University, South Korea. We are grateful to both of (Dean- Research) Prof. Radwan Nile University, Egypt helping for instrumental facilities and Dr. M. Sundararajan, Bharath University, Chennai encouraging research friendly cooperation with Prof. Kaushik Pal for establishing new research excellence of ?Nanoscience Liquid Crystals (NLC)? group. Behind the success of this work all scientific members are gratefully acknowledged for excellent ideas.?The authors would like to thank the Nanotechnology Research Unit (P.I. Prof. Dr. Ahmed I. El-Batal), Drug Microbiology Lab., Drug Radiation Research Department, NCRRT, Egypt, for financing and supporting this study under the project ?Nutraceuticals and Functional Foods Production by using Nano/Biotechnological and Irradiation Processes?.

Abstract
Cervical cancer is the fourth most communal malignant disease amongst women worldwide. In maximum circumstances, cervical cancer indications are not perceptible at its initial stages. There are a proportion of features that intensify the threat of emerging cervical cancer like human papilloma virus, sexual transmitted diseases, and smoking. Ascertaining those features and constructing a classification model to categorize, if the cases are cervical cancer or not is an existing challenging research. This learning intentions at using cervical cancer risk features to build classification model using Random Forest (RF) classification technique with the synthetic minority oversampling technique (SMOTE) and two feature reduction techniques recursive feature elimination and principle component analysis (PCA). Utmost medical data sets are frequently imbalanced since the number of patients is considerably fewer than the number of non-patients. For the imbalance of the used data set, SMOTE is cast-off to solve this problem. The data set comprises of 32 risk factors and four objective variables: Hinselmann, Schiller, Cytology and Biopsy. Accuracy, Sensitivity, Specificity, PPA and NPA of the four variables remains accurate after SMOTE when compared with values obtained before SMOTE. An RSOnto ontology has been created to visualize the progress in classification performance. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
Bone tissue scaffolds require appropriate properties conducive for new tissue growth. In this study, we prepared a novel electrospun nanofiber scaffold using polyurethane (PU), rosemary (RM) oil and copper sulphate (CuSO4) respectively. The properties of the developed membranes were established through scanning electron microscopy (FESEM), atomic force microscopy (AFM), attenuated total reflectance Fourier-transform infrared spectroscopy (ATR-FTIR), thermal gravimetric analysis (TGA), contact angle and mechanical testing. Further, blood compatibility and cytocompatibility assay were carried out to evaluate their biological responses. The developed composites rendered appropriate surface morphology with tailor made wettability and roughness. Composites with engineered physicochemical properties improved the blood and cytocompatible properties which can be potentially exploited for bone tissue engineering applications. © 2019

Abstract
We have studied the impact of TiO2 nano-wires (NWs) used as additives on inter-granular and intra-granular coupling of YBa2Cu3O7-d (noted YBCO or Y-123) superconductor. Series of YBCO/(TiO2)x with 0 ≤ x ≤ 1 wt% were made by solid-state reaction process. The crystal structure, morphology, microstructure and chemical compositions were methodically investigated using X-ray diffraction (XRD), scanning electron (SEM) and transmission electron (TEM) microscopes along with EDX system. XRD showed the obtaining of single YBCO orthorhombic phase for all samples. SEM and TEM observations revealed the occurrence of NWs dispersed among grains inducing inhomegenties and intergrowth of defect regions on YBCO/(TiO2) composite. The excess conductivity of YBCO/(TiO2)x superconductors were examined from the resistivity against temperature results. The examination indicated that the addition of TiO2 NWs led to the change in dimensional in the electrical properties and enhancement of physical parameters. The 0.1 wt% TiO2 added sample showed a dominance of 3D fluctuation regime and higher critical current density Jc(0) among all samples. AC-susceptibility were done using physical properties measurement system (PPMS). The detailed analysis confirmed the strengthening of inter-granular coupling of YBCO with the addition of small amount of TiO2 NWs. The inter-granular current density (Jc,inter(0)) was shown to be the highest in 0.1 wt% added sample. © 2019 Elsevier B.V.

Abstract
This paper deals with the feasibility study of biodiesel production from the tallow rendered from the subcutaneous wastes. The subcutaneous wastes were collected from leather tanneries and animal slaughter houses. The fat content was determined based on the proximate analysis of the collected wastes and various rendering techniques were employed to study the rendering effectiveness. Base catalysed single step transesterification was carried out for biodiesel production. The characterization and quantification of biodiesel was done with the help of FT-IR and GC-MS. Maximum fat content in subcutaneous wastes was found to be 92.84%. The dry rendering technique was found to be very effective than compared to the wet rendering technique and was found to be 18.04% greater than wet rendering technique. The most optimised transesterification parameters were found to be (i) molar ratio: 9.5, (ii) catalyst concentration: 3%, (iii) reaction temperature: 65°C and (iv) reaction time: 70 minutes. The confirmation of biodiesel was concluded from the high intensity peaks in the FT-IR spectra at 1740cm-1 and 1196cm-1 which corresponds to the C=O stretching and O-CH3 group. Ethyl Oleate, Ethyl Palmitate, Ethyl Stearate and Ethyl Myristate were identified as the dominant fatty acids with availability of 40.25%, 21.26%, 17.41% and 3.59% respectively. Based on the results, it can be concluded that possibility of producing biodiesel from subcutaneous wastes was high and can be a viable replacement as low cost feedstock from waste. © 2019 TJPRC Pvt. Abstract
Shell and tube heat exchanger is the most common type of heat exchanger, widely used in oil refinery and other large chemical process. The energy present in the exit stream of many energy conversion devices such as I. C engines, Gas turbines etc. goes as waste, if not utilized properly. For example, the heat energy stored in the engine coolant can be utilized in a better way by recovering the heat for heating purposes inside the cabin. It is comparatively economical than the existing heating arrangements, which employ conventional heating coils. So, the present work has been carried out with a view to predicting the performance of a shell and tube heat exchanger in the field of waste heat recovery application. The objective of this project is to design a shell and tube heat exchanger and study the flow and temperature field inside the shell and tubes using ANSYS Fluent R14.5. An attempt has been made to calculate the performance of the above heat exchanger with and without baffles for parallel flow configurations, and the results so obtained have been compared. © 2019 TJPRC Pvt. Abstract
Fiber reinforced composites are the new age materials, which play a major role in the service sector and engineering field. These materials are tailor-made materials with a different volume fraction of resin and fibers, and the stacking sequence could be made unique for each application depends on the strength requirement. Therefore, whenever engineers try to use a new configuration the proposed laminate has to be tested for its mechanical performance. Nevertheless, experimental testing of each new laminates is a time consuming and expensive process. In this work, comparative study on the results of the mechanical performance of glass/kenaf and glass/aloe Vera fiber reinforced epoxy composite laminates obtained using both experimental testing and Finite element Analysis Method (ANSYS 16.2) is done to find the closeness between the results from the two methods. The laminates are prepared using vacuum assisted resin transfer molding method (VARTM), and the tensile and flexural tests are carried out based on ASTM standard. The comparison of the experimental and FEA method shows that the variation in results is only between 8 to 3%, in two types of laminates, proving that the Finite element method is equally effective, less time consuming and economical for composite analysis. © 2019 TJPRC Pvt. Abstract
Purpose: Parents or primary caregivers of children with Autism Spectrum Disorder (ASD) have important role in early recognition of the disorder as well as in the management of the disorder. Knowledge, attitude and practice of primary caregivers towards children with ASD are important factors in promoting health and wellness of such children. The purpose of this paper is to evaluate the effectiveness of video-assisted teaching regarding care of children with ASD on knowledge, attitude and practice among primary caregivers. Design/methodology/approach: Quasi-experimental research design with one group pre-test post-test was adopted. A total of 60 primary caregivers were selected through stratified random sampling technique. Video-assisted teaching was given to 60 primary caregivers. Data collection was done before and after the video-assisted teaching programme using structured questionnaire which consists of 57 questions. Findings: The result of the study showed that the post-test level of knowledge attitude and practice among primary caregivers of children with ASD was significantly high ($p<0.0001$) when compared to pre-test level by using Wilcoxon Signed Rank Test. The study finding revealed that video-assisted teaching was effective in enhancing the knowledge, developing a positive attitude and good practice among primary caregivers regarding care of children with ASD. Social implications: Findings of this study will help mental health nurses, psychologists, intellectual disability nurses, teachers, public health, social workers, etc. to know the importance of video-assisted teaching programme regarding care of children with ASD and to motivate the primary caregivers to participate in such teaching programme. The community mental health nurse can plan video-assisted teaching programme in a community regarding care of children with ASD. Originality/value: Results of this study indicate that the video-assisted teaching is effective and helps the primary caregivers to enhance the knowledge, attitude and practice regarding care of children with ASD. So continuous awareness in primary health centre and community area is necessary to improve the knowledge, attitude and practice of primary caregivers. © 2019, Emerald Publishing Limited.

Abstract
Selective detection of metal ion is a major research interest in the field of sensors development for environmental safety. Herein, a facile, cost-effective and eco-friendly method is developed to synthesis carbon dots (CDs) from plant material (Plectranthus amboinicus) without any harmful chemicals. As-synthesized CDs exhibited bright blue emission under an excitation wavelength of 390 nm. The Fourier-transform infrared spectroscopy (FT-IR) and X-ray photoelectron spectroscopy (XPS) analysis confirmed the presence of functional groups with respective binding energies (hydroxyl and carboxyl groups) on the surface of CDs. The interaction between CDs and metal ions is examined by the influence of fluorescent intensity changes with respect to the quenching effect of CDs. When compared to the other metal ions, silver ion (Ag+) had an excellent fluorescent quenching of CDs. The fluorescence intensity of CD exhibited a good linear correlation efficiency for the detection of Ag+ ion from 0-30 nM (R2 =0.9905) with a detection limit of 10 nM. In addition, an excellent color change is observed (colorimetric analysis and visible eye observation) for silver ion reduction (from Ag+ into Ag0) compared with other metal ions (no specific color changes). This method is simple, sensitive and selective for colorimetric and fluorescence analysis of Ag+ in a water sample. © 2019 IOP Publishing Ltd.

Abstract

This attempt reports on cobalt oxide (Co3O4) nanoparticles (NPs) prepared through the traditional chemical reflux method to examine the behavior of supercapacitor performance. The synthesized NPs were characterized using several analytical tools such as ultraviolet-visible spectroscopy (UV), Fourier-transform infrared spectroscopy (FTIR), X-ray diffraction (XRD) pattern, and scanning electron microscope (SEM) with energy dispersive X-ray spectroscopy (EDX). Moreover, the electrochemical performance was analyzed using galvanostatic charge and discharge studies (GCD), cyclic voltammetry (CV) studies as well as electrochemical impedance spectroscopy (EIS). The cubical phase of Co3O4 was identified from the XRD pattern and also the average crystalline size was measured by Scherrer's equation. FTIR confirmed the functional group of Co3O4 NPs. SEM images revealed the hexagonal-shaped nanoflakes-like morphology of the sample. From the elemental analysis, the formation of pure Co3O4 NPs by means of high purity and composition ratio of cobalt with oxygen was found. Vibrating sample magnetometer (VSM) plot scrutinized the magnetic performance of Co3O4 NPs. The Co3O4 NPs modified electrode has delivered maximum specific capacitance as 1413 Fg−1 at a current density of 1 Ag−1 which maintains tremendous cycling stability within the retention ratio of 98.4% after 1000 cycles. Abstract
Plasma cell gingivitis (PCG) is a rare condition of the gingiva, characterized by infi ltration of plasma cells. Being a rare benign condition of the gingiva, PCG is characterized with erythematous and edematous gingivitis. The biologic phenomenon of the hypersensitive reaction appears to be chief etiology behind this occasionally presenting clinical entity. Plasma cell gingivitis has a close resemblance to discoid lupus, lichen planus, cicatricial pemphigoid or leukemia, and HIV gingivitis.It is known to present as a hypersensitive response to allergen, but sometimes it could present as a clinical entity with unknown etiology. This paper reports a 60 year old female patient with the complaint of bleeding and swelling of gingiva since 2 months. On detailed history, patient was first diagnosed as drug induced gingival enlargement and based on histopathological findings, a diagnosis of plasma cell gingivitis was made. © 2019, Indian Journal of Public Health Research and Development. Abstract

Avulsion and replantation of the teeth following traumatic injury causes complication such as inflammatory and replacement resorption. This case report describes a traumatic injury to the permanent maxillary central incisor exhibited pulpal necrosis leading to periapical cyst with massive bone loss and extensive external inflammatory root resorption. Endodontic therapy and surgery was performed to salvage the tooth with poor prognosis. The multiple resorptive defects were debrided and restored with resin modified glass ionomer cement. The postoperative follow-up revealed improved healing. The prognosis of the tooth which was badly destructed due to external inflammatory resorption was greatly enhanced with appropriate treatment plan and ultimately increased the longevity of the tooth. © 2019, Indian Journal of Public Health Research and Development. Abstract
The golden ratio otherwise known as the Divine Proportion or Phi, is a mathematical ratio with special properties and aesthetic significance. An enormous number of things in the universe are engineered around the ratio, ranging from the human body to the ark of the covenant to snail shells to the orbits of the planets. The divine ratio and golden rectangles appear throughout the ancient architecture and art. The golden ratio is believed to be the most aesthetically pleasing and harmonious means of design. The Golden section, also known as Phi, is manifested in the structure of the human body. In the present study 50 normal subjects both male and female were randomly screened ranging 25 to 30 years in Chennai were selected. The total height of a subject from the plinth to the head end was measured using the height measuring scalewith off shoes and straight stature and then the navel height from plinth to umbilicus was also measured. The data collected was tabulated and the total height divided by the navel height was calculated. The ratio obtained was 1.621 which is close to 1.618… which is known as the golden ratio, golden proportion or divine proportion. © 2019, Indian Journal of Public Health Research and Development. Abstract
The natural fibre composite has used in a many more automobile and structural application in industry. In the way we are used in a hybrid composite used for those applications. The natural and synthesis fibre are high strength and low weight ratio. It is also used for alternate material in Engineering Industry. In this work the hybrid composite Neem and twiste carbon are used. The carbon fibre more strength next to aramid fiber. And the mechanical properties are studied like tensile, flexural and impact testing corresponding fracture surface also studied. Finally, in this work concluded for engineering application. © TJPRC Pvt. Ltd.

Author Keywords

Abstract

--In the present study carried out to investigate prophylactic activity of Cobalt nanoparticles towards isolated Escherichia coli (strain MTCC 723); the antimicrobial properties of Cobalt nanoparticles also determine by optimizing the concentration of Cobalt nanoparticles. A homogenized suspension was prepared by sonication Cobalt nanoparticles in water, and the infusion was prepared at concentrations of 5– 35µg/ml. The pathogenic strain of microbial species was cultured under anaerobic conditions. Equalized standard dilutions of the cultured bacteria were used for testing. Spectroscopic and diffusion tests were conducted to quantify the antimicrobial properties of Cobalt nanoparticles against the bacteria. Cobalt nanoparticles of 200 nm diameter with concentration of 35µg/ml showed completely lysis of Escherichia coli cell. The results showed Cobalt nanoparticles with concentration of 35 µg/ml significant higher activity against Escherichia coli. Optimized concentration of Cobalt nanoparticles kills the pathogenic Escherichia coli cells. ©BEIESP.

Abstract
A color mapping is a process by which we transfer the particular range of colors from source to the target image. This paper says about a novel method for medical images using pseudocolor by pre existence of color mapping. Conversion of grey scale image to color has no exact way or approach, direct way to colorize is tedious by which the entire range of colors can be changed, but in color mapping the conversion is done by converting the whole black and white image into color. This novel method presents black and white image to various colors. By the creation of color map that color map is applied for colorizing the medical grey scale images. This approach can be used for grey scale medical images irrespective of size and shape such that the intensity and aspect of the image can be improved. ©BEIESP.

Bi-objective constraint and hybrid optimizer for the test case prioritization

(2019) *International Journal of Engineering and Advanced Technology*, 8 (6), pp. 3436-3448. Cited 87 times.

DOI: 10.35940/ijeat.F9515.088619

Abstract
Regression testing is performed to make conformity that any changes in software program do not disturb the existing characteristics of the software. As the software improves, the test case tends to grow in size that makes it very costly to be executed, and thus the test cases are needed to be prioritized to select the effective test cases for software testing. In this paper, a test case prioritization technique in regression testing is proposed using a novel optimization algorithm known as Taylor series-based Jaya Optimization Algorithm (Taylor-JOA), which is the integration of Taylor series in Jaya Optimization Algorithm (JOA). The optimal test cases are selected based on the fitness function, modelled depending on the constraints, namely fault detection and branch coverage. The experimentation of the proposed Taylor-JOA is performed with the consideration of the evaluation metrics, namely Average Percentage of Fault Detected (APFD) and the Average Percentage of Branch Coverage (APBC). The APFD and the APBC of the proposed Taylor-JOA is 0.995, and 0.9917, respectively, which is high as compared to the existing methods that show the effectiveness of the proposed Taylor-JOA in the task of test case prioritization. © BEIESP.

Abstract

The Multilevel Z sources Inverter have been documented as attractive topologies used for elevated voltage adaptation. As the digit of levels improved, the synthesized set of steps output waveform have many ladder, imminent the preferred sine waveform but the major weakness of MLI be its amplitude of ac output voltage is imperfect to DC input sources voltage summing up. To conquer this drawback seven level cascading symmetric multilevel inverter based Z source inverter have been projected. This work focuses on different multi-carrier sinusoidal PWM scheme for the seven level three phase Z source symmetric cascading inverter. Performance parameters of seven level three phase Z source symmetric cascading inverter has been analyzed. A simulation circuit model of seven level three phase Z source symmetric cascading inverter urbanized using MATLAB/SIMULINK and its presentation have been urbanized. © BEIESP.

Abstract
In the present study, biodegradable poly(amidoamine) dendrimers (PAMAM G1/G2/G3) was covalently functionalized with carbon nanotubes (CNTs) and nanostructured hydroxyapatite was immobilized onto CNTs-PAMAM matrix through coordination bond between the –NH2 groups of dendrimer and Ca2+ of hydroxyapatite. The structural and morphological behaviors of the nanohybrids were established through spectroscopic and microscopic analyses. In vitro cytotoxicity and cell proliferation was assessed through osteoblast-like MG 63 cell line using 3–4, 5-dimethylthiazole-2-yl, 2,5-diphenyl tetrazolium bromide assay for 3 days. The more abundant of –NH2 group exist in PAMAM(G3) dendrimer attracts more number of HAp molecules onto their surface which exhibits enhanced activity in cell proliferations even at higher concentrations. © 2019, The Polymer Society, Taipei.

Abstract
Migraine is characterized by headache due to imbalance between excitation and inhibition of neurons disabling normal day to day activities. The excitations of neurons are done by excitatory neurotransmitter glutamate which plays the key role in creating any pathology related to neurons. This study was done to identify GluR1 a subunit of AMPA glutamate receptor in the cells of trigeminal ganglion after inducing migraine and compare it with control rats. The GluR1 subunits were localized in the cytoplasm of neurons, and these subunits were up-regulated following a migraine. The GluR1 was also localized in satellite glial cells and nerve fibers, indicating these subunits expressed in neurons and migrate during nociceptive sensitization. This GluR1 expression in the cells of trigeminal ganglion may be crucial in nociceptive sensitization leading to migraine and other painful conditions like trigeminal neuralgia. © International Journal of Research in Pharmaceutical Sciences.

Abstract
To identify the sex determination of an unknown person from the skeleton remains the first and primary important step come across by the anatomical, forensic and archaeological experts. Many researchers have considered various morphometric parameters for sex determination using hip bone. The current study was carried out to identify the sex of hip bone using various dimensions of the greater sciatic notch. Adult hip bones of a known person were studied and evaluated. The hip bones were assessed using various parameters. The posterior segment, posterior angle and index II of a hip bone were found to be more helpful in sex determination. © International Journal of Research in Pharmaceutical Sciences.

Abstract
Migraine, a major public health problem, occurring due to the consequences of serial multi-pathophysiological changes in the trigeminal nerve ganglion leading to an imbalance in the excitation and inhibition. The glutamate is the major excitatory neurotransmitter in the central nervous system, causing excitotoxicity to the sensory neurons leading to sensitization and nociception. The present study was done to determine the effects of Riluzole on the Nr2B subunits of NMDA receptors after inducing a migraine. The rats were treated with Riluzole after inducing migraine with nitroglycerin 10mg/kg. The nitroglycerin treated rats showed intense staining for NR2B subunits, and there was a decrease in the expression after Riluzole treatment. This study concludes that the NR2B subunits are upregulated during migraine and Riluzole can be used to control those upregulations by its neuroprotectant property. © International Journal of Research in Pharmaceutical Sciences.

A review on the neuroprotective effect of nelumbo nucifera seed pod

(2019) *International Journal of Research in Pharmaceutical Sciences*, 10 (3), pp. 2307-2310.

DOI: 10.26452/ijrps.v10i3.1469

Abstract
Receptaculum Nelumbinis, the dried seed pod of Nelumbo nucifera, exhibited good efficacy for improving learning and memory abilities. Earlier, studies revealed that Receptaculum Nelumbinis can exert therapeutic effects in diverse disorders like heart failure, neoplasm via anti-oxidative, anti-inflammatory and anti-proliferative activities. In the central nervous system (CNS), Receptaculum Nelumbinis (RN) also has beneficial effects on various disorders, such as Alzheimer's disease (AD), depression, Parkinson's disease (PD), cerebral ischemia, epilepsy, and Huntington's disease (HD). RN also enhances memory and cognition ability of rodents in dissimilar pathological conditions, such as stress exposure, diabetes, aging and high-fat diet (HFD). The effect of noise stress on exploratory, locomotor, and anxiolytic activity in the open-field behavior (OFB) test and the effect of drug RN and active component quercetin, a flavonoid isolated from seedpod in overcoming these changes. Optimistically, getting a vibrant impression concerning the role of RN in the CNS, the present paper summarizes and discusses the pharmacological effects of RN as well as its possible mechanisms in CNS disorder prevention and or therapy. © International Journal of Research in Pharmaceutical Sciences.

Abstract
This study was done to show the changes in the liver following diclofenac treatment and to study the hepatoprotective effects of Vitamin E and A in diclofenac treated rats. Rats were divided into four groups of six rats each. Group-1: Control rats (n= 6), Group-2: Rats (n= 6) treated with diclofenac at dose of 50 mg/kg IM for 7 days, Group-3: Rats (n= 6) treated with Vitamin A at dose of 400 IU/kg orally followed by diclofenac at 50 mg/kg IM 2 h later for 7 days, and Group 4: Rats (n= 6) treated with Vitamin E at dose of 200 IU/kg orally followed by diclofenac at 50 mg/kg IM 2 h later for 7 days. Later it was analysed with standard bio markers, and it was histologically interpreted. The results showed that there was an rapid increase in the levels of liver function test in diclofenac-treated group, which was significantly decreased after pre-treatment with vitamin E than vitamin A. The liver acinus showed cen-triacinar necrosis of hepatocytes after 7 days of diclofenac treatment, which was prevented by administration of Vitamin E and A. Drug-induced liver injury possesses a major clinical problem and has become a leading cause of acute liver failure and transplantation. Although the exact mechanism by which diclofenac injuries in the liver is not understood, some studies explain the toxicity by affecting cytochrome P 450, leading to the production of active metabolites. Hepatoprotective effects of Vitamin E were better compared to Vitamin A following treatment with NSAIDS. Hence, it may be necessary to administer Vitamin E in patients treated with diclofenac. © 2019 Pharmascope Publications. All rights reserved.

Author Keywords

Abstract
Drug-induced liver injury possesses a major clinical problem and has become a leading cause of acute liver failure and transplantation. Overstressed liver compromises its detoxification role, which may expose it to a variety of diseases and disorders.The present study was to determine whether pre-administration of various doses of vitamin E would have a protective effect against diclofenac-induced hepatotoxicity in Wistar male rats. Twenty-four albino male rats weighing 180-200g were divided equally into four groups. In control group rats were administrated with physiological saline 2ml/kg b.wt /intramuscularly. Another group with 50mg/kg b.wt/ intramuscularly/seven days diclofenac was used for inducing toxicity. In experimental groups, rats were administrated with different doses of vitamin E along with diclofenac sodium [200 and 400 IU orally and 50mg/kg b.wt/ intramuscularly/seven days]. Showed that there was a rapid increase in the levels of liver function test in diclofenac-treated group, which was significantly decreased after pre-treatment with high dose than low dose of vitamin E. Although the exact mechanism by with diclofenac injuries liver is not understood, some studies explain the toxicity by affecting cytochrome P 450, leading to the production of active metabolites. Administration of different dose of diclofenac sodium induces severe adverse effects in the liver and kidney. © 2019 Pharmascope Publications. All rights reserved.

Effect of TiO2 and nozzle geometry on diesel emissions fuelled with biodiesel blends

(2019) *International Journal of Ambient Energy*, 40 (5), pp. 477-481. Cited 20 times.

DOI: 10.1080/01430750.2017.1410229

Abstract
In this present study, the compression ignition engine was designed to run on CIME (Calophyllum inophyllum methyl ester) biodiesel with nanoparticles. The TiO2 nanoparticle is added to the biodiesel in the form of nanofluid at concentration levels of 100 ppm whereas ethanox is added at levels of 100, 200 and 500 ppm. The nanoparticle and the ethanox are dispersed by the ultrasonication process. The addition of nanofluid reduces the particulate emission like nitrogen oxide (NOx) at 100% load. The efficiency is better and emission is reduced owing to the influence of explosion of water molecules present in the biodiesel. We found ethanox to be a superlative nanofluid to reduce the emission of toxic gas at appreciable levels. We have witnessed a 20% reduction in emission of NOx and 10% reduction of other particulate emission. In addition, the exit geometry of exhaust is modified from a circular shape to an elliptical one and the consequence of the geometry is calculated. © 2017, © 2017 Informa UK Limited, trading as Taylor & Francis Group.

Abstract
Fibre reinforced plastic (FRP) composites are being widely utilized in various industries because of their superior mechanical properties. Besides their advantages, failure of these composites can occur either by an individual or an associated of various failure modes which are very difficult to distinguish and discriminate the damages. This paper focuses on solving this issue, by characterizing the various failure modes in glass, carbon and their hybrid composite laminates in epoxy resin under uni-axial tensile loading with acoustic emission (AE) monitoring. AE data recorded during the testing of a pure-resin specimen and the single-layer specimen were used to identify the matrix cracking and debonding, respectively, whereas delamination was predominant in a two-layer specimen. The fibre failure was obtained from the resin impregnated single fibre strand. The parametric studies using AE amplitude, duration, AE cumulative counts, AE cumulative energy, rise angle (RA) and peak frequency were used to describe the damage mechanism of the different stacking sequence of glass fibre reinforced plastic (GFRP), carbon fibre reinforced plastic (CFRP) and their hybrid composite laminates. The mechanical parameter and AE parameter was successfully correlated for discrimination of damage mechanism. The individual failure mode of glass, carbon and their hybrid composite laminates with the most critical damage mechanisms and the time-to-failure were investigated. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.

A study on thoracic splanchnic nerves: Anatomo-surgical appraisal
(2019) *Journal of the Anatomical Society of India*, 68 (3), pp. 221-225.

DOI: 10.4103/JASI.JASI_60_19

Abstract
Introduction: The thoracic splanchnic nerves greater, lesser, and least are derived from medial branches of the lower seven thoracic sympathetic ganglia; they carry preganglionic fibers, pierce the diaphragmatic crura, and supply the abdominal viscera through coeliac and aorticorenal plexus. These splanchnic nerves carry pain conducting visceral afferent fibers from the upper abdominal organs, including the pancreas. The origin of the splanchnic nerves from different roots may have a significant role in clinical presentation of patients than the normal or absence of consecutive nerve roots. Material and Methods: The study was done on 26 formalin-fixed cadavers (52 sides) from the Chettinad Hospital and Research Institute, Chennai, and University College of Medical Sciences, Delhi. The endothoracic tissue and the parietal pleura in the paravertebral region were carefully removed from the 1st rib to 12th rib (costodiaphragmatic recess). The thoracic sympathetic chain and its medial branches were traced from its origin to medial arcuate ligament. Any variations in the origin, formation, and communication of the splanchnic nerves were noted and photographed. Results: The origins of splanchnic nerves were bilaterally asymmetrical in most of the cases. The greater splanchnic nerve (GSN) was always present, whereas lesser splanchnic nerve and least splanchnic nerve were found to be absent in 40% and 80% cases, respectively. The GSN showed great variability both in the level of its origin and in the pattern of its formation. In the present study, four different patterns of GSN origin were observed in addition to normal. Discussion and Conclusion: Significant differences were noted in the formation and communication between the thoracic splanchnic nerves. The patterns in the formation were not only different from cadaver to cadaver but also were bilaterally asymmetrical. © 2020 Journal of the Anatomical Society of India | Published by Wolters Kluwer - Medknow.

Abstract
Epileptic seizure is the most predominant brain disorder that has affected at least 1% of the world's population and higher numbers are affected in the underdeveloped countries. The best marker for diagnosis of seizure is to analyse the EEG signals. The statistical parameters of EEG signals vary when there is an occurrence of seizure. In this paper the statistical parameter interquatile range and Mean absolute deviation are taken as features and are classified using unsupervised learning algorithms (clustering techniques). K-Mean, K-Centers, Parzen Classifier, K- Nearest Neighbour, Gaussian mixture model, and Naive Bayes classifier are put to test to find out the best suited algorithm. Among the methods used K-Nearest Neighbour gives the maximum accuracy of 100%, sensitivity and specificity of 1 for the given data followed by Parzen classifier with 98.02% of accuracy, and has a sensitivity of 0.96, specificity of 1.The Naieve bayes classifier with 96.71% of accuracy is the fastest algorithm with 0.019 ms and hence can be used for real time applications. © 2019, Indian Journal of Public Health Research and Development. Abstract
With the approach of the self supervised cars, the significance and exactness of path discovery has accomplished principal significance in the field of perception and imaging. In this paper, we propose a calculation to accomplish path recognition on streets utilizing the real-time data accumulated by the camera and applying K-means clustering method to report data in a way reasonable to make a feasible guide. The proposed method utilizes the physical way of the data to group the data. Silhouette coefficient is utilized to decide the quantity of groups in which the data ought to be partitioned. Paths are added to get the right markings. We show the adequacy of, the proposed method utilizing real-time activity data to commotion, shadows, and light varieties in the caught street pictures, and its materialness to both stamped and unmarked streets. © BEIESP.

Enhances the capacity of load adjusting by improved load balancing methodology in p2p network
(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (9 Special Issue 2), pp. 446-453.

DOI: 10.35940/ijitee.I1095.0789S219

Abstract
To upgrades the limit of load modifying by working up a novel enhanced load adjusting philosophy in heterogeneous P2P network with suitable load assignment and load reallocation process. We moreover propose another new adjusting procedure called two load adjusting strategy for peer to peer networks to make the best load designation assurance when a novel partner arrives. The new load adjusting method is also prepared to achieve the load reallocation immovably through framework running time, if congested peer arrives. In load altering estimation, no virtual servers are used. Subsequently, preparing overhead is diminished in light of restrictive meta-data preservation. Besides load adjusting additionally centers around controlling the framework action. The idea behind model is to investigate the impact of peer heterogeneity and to adjust the load dissemination in P2P frameworks. ©BEIESP.

Abstract
With many adverse effects happening on population due to medic al drugs, there is driving need to find these effects and reduce it. Hence researchers are working on FDA_AERS, a real time database to find the adverse effect present in drugs. This field has developed as pharmacovigilance and data mining algorithm helps in improving the accuracy of clinical analysis. In this paper, growth of Pharmacovigilance in India and a novel way to find adverse drug reaction is proposed. ©BEIESP.

Abstract
Creature an ensemble method, Random Forest create numerous DTs as base classifiers and invoke larger part voting to consolidate the results of the base trees. In this exploration work an endeavor is made to improve execution of Random Forest classifiers as far as correctness and time required for erudition and classification. we first present another variety of Optimal irregular Forest reliant on a direct classifier, by then build up a group classifier subject to the blend of a brisk neural Network (NN), vector-utilitarian association arrange and Optimal arbitrary Forests. Arbitrary Vector have a rich close structure game plan with incredibly short preparing time. The observational assessment and consequences of tests finished in this investigation work lead to reasonable learning and arrangement using RF. ©BEIESP.

Abstract
Mining frequent item-sets is an important concept that deals with fundamental and initial task of data mining. Apriori is the most popular and frequently used algorithm for finding frequent item-sets which is preferred over other algorithms like FP-growth due to its simplicity. For improving the time efficiency of Apriori algorithms, Jiemin Zheng introduced Bit-Apriori algorithm with the enhancement of support count and special equal support pruning with respect to Apriori algorithm. In this paper, a novel Bit-Apriori algorithm, that deletes infrequent items during trie2 and subsequent tries are proposed which can be used in pharmacovigilance to identify the adverse event. © BEIESP.

A metaheuristic algorithm for VLSI floorplanning problem

(2019) *International Journal of Recent Technology and Engineering*, 8 (2 Special issue 5), pp. 249-254.

DOI: 10.35940/ijrte.B1052.0782S519

[b] Department of Electronics and Communication Engineering, Bharath University, Chennai, India

Abstract
Floorplanning plays an important role within the physical design method of very large Scale Integrated (VLSI) chips. It's a necessary design step to estimate the chip area before the optimized placement of digital blocks and their interconnections. Since VLSI floorplanning is an NP-hard problem, several improvement techniques were adopted to find optimal solution. In this paper, a hybrid algorithm which is genetic algorithm combined with music-inspired Harmony Search (HS) algorithm is employed for the fixed die outline constrained floorplanning, with the ultimate aim of reducing the full chip area. Initially, B*-tree is employed to come up with the first floorplan for the given rectangular hard modules and so Harmony Search algorithm is applied in any stages in genetic algorithm to get an optimum solution for the economical floorplan. The experimental results of the HGA algorithm are obtained for the MCNC benchmark circuits. ©BEIESP.

Abstract
The medical image processing is extensively used in several areas. In earlier detection and treatment of these diseases is very helpful to find out the abnormality issues in that image. Here there are number of methods available for diagnosis to detect the brain tumor of MRI image. This study deals with there are two main contributions are implemented in this filter method. (1)The extension of adaptive bilateral method to apply sub-bands of low frequency signal decomposed using wavelet transform. A wavelet threshold is combined with adaptive bilateral method to form an innovative structure in image de-noising method. It's very efficient to eliminate noise in original noisy images. (2) First detected block boundary and texture regions discontinuities to adapt or control the parameters of spatial and intensity in bilateral filter. The adaptive method can improve the restored image quality in this test result compared with standard bilateral filter. The proposed segmentation technique uses novel strip method and the image is split into number of strips 3, 4, 5 and 6. Using a hybrid Assured Convergence PSO (ACPSO) and Fuzzy C-Mean Clustering (FCM) was proposed method. The segmentation algorithm presented in this research gives 95% of accuracy rate to detect brain tumor when strip count is 5. In this research work presented a feature vector using a different statistical texture analysis of brain tumor from MRI image. The statistical feature texture is computed using GLCM (Gray Level Co-occurrence Matrices) of Brain Nodule structure. For this research work, the brain nodule segmented using strips method to implemented marker watershed image segmentation based on PSO (Particle Swarm Optimization) and Fuzzy C-means clustering (FCM). Furthermore, the four angles 0o, 45o, 90o and 135o are calculated the segmented brain image in GLCM. The four angular directions are calculated using texture features are correlation, energy, contrast and homogeneity. The accuracy rate of previous method was compared and proved the proposed method an Assured Convergence Particle Swarm Optimization (ACPSO)-Fuzzy C-Mean (FCM) and using SVM classification technique is suitable for the early detection of brain tumor. In proposed, a tumor extraction is improved in ASPSO-FCM and SVM classification with better accuracy rate of 95.31%. © Blue Eyes Intelligence Engineering & Sciences Publication.

Abstract
Customer loyalty is a buzzing word in this multifaceted business state of affairs. Deriving loyalty is not so effortless. Apparel sector is a trend oriented industry. Retail apparel sectors facing sturdy competition in the industry, however it remains healthy. The researcher wants to find out the responsible factors of apparel customer loyalty in Chennai city. Research gap The Researcher has validated the Dabholkar et al (2000) to derive the apparel customer loyalty as a outcome variable while store reputation serves as a mediating variable. Earlier studies concentrated on validating Retail service quality model on Apparel Customer Satisfaction. Methodology Selected Retail outlets were chosen and 276 samples was obtained using mall intercept method. Structural path was constructed by the researcher using Dabholkar et al (2000). Store Reputation is the mediating variable between loyalty and RSQL constructs. Findings The researcher found strong relation between Service quality constructs and loyalty while store reputation serves as a mediation variable. However store policy is having direct relationship with loyalty intention of the apparel customer. © BEIESP.

Abstract
This Paper displays an adaptable and versatile movement estimation processor fit for supporting the handling prerequisites for top notch (HD) video utilizing the H.264 Advanced Video Codec, which is appropriate for FPGA execution. This paper dependent on General Purpose processor plan for movement estimation process. Quick movement estimation calculation with full pursuit calculation and precious stone hunt calculation. Where the two calculations have been executed in a solitary processor. So client can powerfully pick as per best execution. A client can choose the alternative of video quality at run time. In contrast to most past work, our center is enhanced to execute all current quick square coordinating calculations, to coordinate or surpass the between casing expectation execution of full-seek approaches at the HD goals generally being used today. Different tale movement estimation designs have been proposed all through the writing for dealing with the high data transfer capacity imperative nature of Video Broadcasting. A High precision full pursuit fixed square inquiry calculation is used to lessen the general transmission capacity and power prerequisite for transmitting live video arrangements. Despite the fact that full hunt guarantees high exactness, it tradeoffs its calculation time for precision. So the precision advantage is emphatically obscured by working velocity. To supplant the Full inquiry calculation another Modified Diamond seek calculation has been proposed with best precision and streamlined movement estimation length. Execution assessment of FBS Full hunt and Diamond look will be thought about for future investigation. © Blue Eyes Intelligence Engineering & Sciences Publication.

Abstract
Recent video surveillance system provides a path to continuously monitor any place at any time. In addition IP based surveillance system helps to monitor the place remotely through wide area network. Here the system is designed such that the camera which captures the video act as the front end and the computer which helps as to view the details acts as the client of the system. The main aim of this paper is to increase the resolution of the video in the system and to reduce the transmission time of the IP based video surveillance system. In this system we use IP camera to capture the scene and a field programmable gate array (FPGA) is connected to the local server through the IP network.The FPGA used here is programmed to process the captured video and operates towards effective data transmission in IP network. The algorithms like connected component labeling, background modeling is analyzed along with High Efficiency Video Coding (HEVC) to enhance the quality of the video captured. In futureon updating the designed model Using WAP structure the cell phones can be used for the client side of the system.As expected due to the introduction of efficient video coding and IP networking the transmission time is highly reduced in our proposed system. © Blue Eyes Intelligence Engineering & Sciences Publication.

An experimental technique on features extraction for product feedback using opinion mining
(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (8 Special issue 3), pp. 481-485.

[a] Department of Computer Science, Pondicherry UniversityCC, India
[b] Computer Science Engineering, Bharath University, Chennai, India

Abstract
Now a days with increased use of social media, user reviews on any product plays a significant role. The existing opinion mining techniques operate only on single review corpus; it doesn't consider distribution of opinion features across different corpora. A new technique is proposed to extract opinion features from online reviews across two corpora, one a given review corpus and other is contrasting corpus. This discrepancy is evaluated using domain relevance. The first step is to find candidate opinion features in domain review corpus using syntactic dependence rules. This evaluate intrinsic domain relevance scores for each candidate on domain-dependent corpora and extrinsic domain relevance score on domain-independent corpora. A candidate features which are less generic and more domain specific are the final opinion features. This interval thresholding is called as the intrinsic and extrinsic domain relevance. ©BEIESP.

Abstract
In this article single patch antenna with multiple feed lines is presented. The antenna is tested with four ports each separated at 90 degrees. The ports separated at 180 degrees have the same effects and same polarisation. The S-parameter of port 1 and port 2 are same due to horizontal polarisation then port 2 and port 4 are same due to vertical polarisation. The Port 1 and Port 3 resonates at frequency of 2.092GHz and 4.563GHz. It covers applications of UMTS (1.885GHz-2.2 GHz) and C band (4 GHz – 8GHz). The Port 2 and Port 4 resonates at frequency of 1.66GHz and 5.155GHz. It covers applications of GPS (1.565GHz – 1.665GHz) and WLAN (5 GHz – 6 GHz). The return loss of the frequencies is less than10dB. The isolation among the ports are less than 15 dB. © BEIESP.

Abstract
Objective: The aim of the study is to understand the efficacy of Ayurvedic medicine by subjecting it to gas chromatography-mass spectrometry (GC-MS) analysis. This knowledge could help in finding the molecules that are of medicinal importance. Materials and Methods: Mahamasha Thailam was bought from a Standard Ayurvedic vendor at Chennai and subjected to GC-MS analysis by standard procedures. Results: The GC-MS results indicated the presence of some important molecules such as n-Hexadecanoic acid, n-Decanoic acid, 2,6-Difluoro-3-methylbenzoic acid, 2,3-dichlorophenyl ester, propane, and 2-methoxy-2-methyl-, which have medicinal roles supporting the pain reliving role of Mahamasha Thailam. Conclusions: GC-MS results indicated that the medicinal roles of some of the important molecules augur well with the activity of Mahamasha thailam. The roles of some other molecules such as 1-Heptanol, 2,4-diethyl-, Cis-3-ethyl-endo-tricyclo[5.2.1.0(2.6)]decane, 3-Octyne, 2,2,7-trimethyl-, 1,3-Benzodioxole, 5,5′-(tetrahydro-1H,3H-furo[3,4-c]furan-1,4-diyl)bis-, [1S-(1.alpha.,3a.alpha.,4.beta.,6a.alpha.)]-, and 1,3-Dioxolane-2-methanol are not reported yet. © 2019 JPR Solutions. Association of myo1h gene polymorphism in mandibular retrognathism in south indian dravidian population
(2019) *Indian Journal of Public Health Research and Development*, 10 (6), pp. 219-223.

DOI: 10.5958/0976-5506.2019.01270.1

Abstract
Recently Myosin 1H gene has been implicated in mandibular retrognathism. But the quantitative influence of Myosin 1H polymorphism on mandibular retrognathism is yet unexplored. This study was conducted to understand the role of Myosin 1H single nucleotide polymorphisms in mandibular retrognathism using South Indian Dravidian population as samples. Lateral cephalograms were obtained from retrognathic and normal individuals and related to genotype to study the power of association between them. Definite influence of gene make up is seen on muscle growth and in turn mandibular retrognathism but quantitative association could not be determined due to possible over shadowing influence of cybernetics. In future studies considering gene- environment interactions should be investigated to estimate the overall risk of a large sample size to clarify the association of MYO1H gene in causing true mandibular retrognathism. © 2019, Indian Journal of Public Health Research and Development. Association of myo1h gene polymorphism in mandibular retrognathism in south indian dravidian population
(2019) *Indian Journal of Public Health Research and Development*, 10 (6), pp. 219-223.

Abstract
Recently Myosin 1H gene has been implicated in mandibular retrognathism. But the quantitative influence of Myosin 1H polymorphism on mandibular retrognathism is yet unexplored. This study was conducted to understand the role of Myosin 1H single nucleotide polymorphisms in mandibular retrognathism using South Indian Dravidian population as samples. Lateral cephalograms were obtained from retrognathic and normal individuals and related to genotype to study the power of association between them. Definite influence of gene make up is seen on muscle growth and in turn mandibular retrognathism but quantitative association could not be determined due to possible over shadowing influence of cybernetics. In future studies considering gene- environment interactions should be investigated to estimate the overall risk of a large sample size to clarify the association of MYO1H gene in causing true mandibular retrognathism. © 2019, Indian Journal of Public Health Research and Development. Abstract
Hyperdontia had been reported with certain syndromes but hyperdontia in a non-syndromic individual are not commonly found and reported. The etiology of non-syndromic hyperdontia was not clearly known. This paper reports a case with multiple supernumerary and Supplementary teeth presents bilaterally. © 2019, Indian Journal of Public Health Research and Development. All rights reserved.

Abstract
There has been global resurgence of interest in herbal drugs in the recent past. Though herbal medicines are effective in the treatment of various ailments very often these drugs are unscientifically exploited or improperly used. Therefore, these herbal drugs deserve detailed studies in the light of modern medicine. In spite of synthetic drugs, herbal drugs have their place in therapy. Their effectiveness, low-cost and comparative freedom from serious toxic effects makes these medicines not only popular but also an acceptable mode of treating diseases even in modern times. Medicinal plants are those plants that are used in treating and preventing specific and human has been using herbs for generations around the world, due to charm needed to cure the disease, many people have come to the conclusion that even chemical drugs their answers may already be sick of these medications may be harmful for health them in the future. Still, the use of plants as a source of medicine is very much important for human beings. Identify medicinal and how to use them is so important. © 2019, Blue Eyes Intelligence Engineering and Sciences Publication. All rights reserved.

Abstract
Various factors are responsible for the success of a Ni-Cr prosthesis. Marginal fit or Integrity is one. The close adaptation of the margin of the prosthesis with the finish line of preparation leads to good Marginal Integrity This study compares the marginal integrity between an imported Ni-Cr alloy and an indigenous Ni-Cr alloy. There is no significant difference in mean values of vertical marginal opening between Indigenously and Imported alloy at “As-cast-fit” stage. The mean value of vertical marginal openings of both alloys after opaque, Body-enamel and Glaze firings are comparable (No significant difference). © 2019, Indian Journal of Public Health Research and Development. Effect of rice processing towards lower rapidly available glucose (RAG) favors Idli, a South Indian fermented food suitable for diabetic patients

(2019) *Nutrients*, 11 (7), art. no. 1497, .

Abstract
The Asian food pattern primarily embraces rice and rice-based products, which mainly comprise 90% starch. Amongthese various food products, Idli is mostly prepared through fermentation. It has high palatability, and the rapid and highly digestible nature of the food product results in a higher post-glucose level in diabetic patients. A heat-treated Idli rice sample was prepared by roasting parboiled rice at the temperature range of 155 to 165°C for 65 to 75 s. Idli/rice-based Dokala made from heat-treated rice is better when compared to untreated rice in terms of its microbiological profile and physiochemical properties. The proximate composition of heat-treated parboiled rice Idli/Rice Dokala showed slightly higher values than the untreated parboiled rice Idli/Rice Dokala, which reveals that it has marginally higher nutritive value. Determination of the Rapidly Available Glucose (RAG) and Slowly Available Glucose (SAG) values, SEM analysis, resistant starch analysis, microbial assay, and in vivo studies were performed to determine the glycemic index (GI) and glycemic load in normal and diabetic persons. Sensory analysis also proved that heat-treated Idli/Rice Dokala is superior to untreated based on the color, flavor, appearance, taste, and texture. © 2019 by the authors. Abstract

In recent times, Underwater Wireless Sensor Networks (UWSNs) have involved various applications in oceanographic data collection, pollution revealing, environmental monitoring, offshore exploration, disaster prevention, military surveillance, etc. nevertheless the unique characterization of UWSNs are designed for the grid division on geographical system with polar tracing function to attain the shortest- path and minimizing the energy consumption for end – to – end transmission. In this paper, we proposed a Grid Division Polar Tracing (GDPT) routing protocol function using greedy algorithm for reducing the energy consumption by incorporating into cubic grids and polar tracing functions. The NS2 simulation results proved that the optimal distance of the found path, packet delivery ratio, network lifetime, energy consumption and propagation delay are the performance metrics in the routing protocols. In proposed case used for application of underwater sensor based health monitoring system for wireless in under water environment. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

Classification of damages in composite images using Zernike moments and support vector machines
(2019) *Composites Part B: Engineering*, 168, pp. 77-86. Cited 60 times.

DOI: 10.1016/j.compositesb.2018.12.064

Abstract
In this work, the strength of the composite material is tested and the damages are classified using supervised method. The image is obtained from the front and rear sides of the composite material after applying 5 mm, 6 mm and 7 mm impingement. Initially, the images are filtered using anisotropic diffusion filter. Global and local damages in the structures are segmented using Fuzzy C-Means (FCM) clustering method. Geometrical features and Zernike Moments (ZM) are calculated from the delineated regions. The performance of the features is tested using Support Vector Machine classifier. Results show that the FCM with three and four cluster centres is able to segment the global and local damages respectively. The global damages due to different impinges are classified better compared to the local damages. The global damages in the rear side are able to classify better compared to the front side in both geometrical and ZM features. In the case of local damages, the rear side is able to classify better in 5 mm–6 mm and front side in 6 mm–7 mm. It is concluded that the features obtained from the ZM gives better accuracy in both global and local damages compared to the geometrical features. The image based analysis carried out on this work is able to classify the impairment in composite materials; this framework can be used in the industrial applications for the quantification of damages. © 2018 Elsevier Ltd

Abstract
Mg-doped BiFeO3 (Bi1−xMgxFeO3 (0.00 ≤ x ≤ 0.15)) nanoparticles (NPs) have been successfully prepared by simple solution combustion method using urea as fuel. The obtained product was sintered at 550 °C for 2 h to get pure-phase formation. The as-prepared samples were characterized by powder X-ray diffraction (XRD), Fourier transform infrared (FT-IR), field emission scanning electron microscopy (FE-SEM), energy-dispersive X-ray spectroscopy (EDX), transmission electron microscope (TEM), ultraviolet–visible (UV-Vis) absorption, photoluminescence (PL) spectra, and vibrating sample magnetometer (VSM) analysis. Powder XRD study revealed that all products exhibit rhombohedral structure with pure-phase formation. The average crystallite size of the samples decreased from 56.25 to 46.15 nm with increasing the concentration of Mg (x = 0.00, 0.05, 0.10, and 0.15). Surface morphology of the samples were analyzed by FE-SEM and TEM micrograph techniques, and the grain distribution was not quite homogeneous and observed agglomeration of the particles, which is mainly due to the magnetic interaction among them. EDX analysis confirmed the presence of Bi, Fe, O, and Mg elements without any form of impurity peak in all products. PL spectra shows a high intense peak at 464 nm, which is attributed to blue emission. The saturation magnetization is enhanced with increasing Mg doping level at RT. Antibacterial activity of Bi1−xMgxFeO3 NPs was found to be enhanced with increase in Mg doping concentration as it causes a reduction in the grain size of the samples. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

An experimental analysis on opinion mining feature identification for product analysis
(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (8 SpecialIssue 3), pp. 82-86.

[a] Computer Science Engineering Bharath University, Chennai, India
[b] Department of Computer Science, Pondicherry University CC, India

Abstract
Opinion feature mining is also known as aspect mining used to take out users opinions, and attitudes towards a specific product, services and their characteristics. he most of the existing approaches to opinion feature extraction on mining patterns is only by using a single review corpus. his paper presents the new method to discover the opinion features from online reviews by taking out the difference in opinion feature statistics across two different corpora, one domain specific corpus and another is domain independent corpus (i.e. the contrasting corpus). Domain relevance is the measure which is used to capture the disparity. he domain relevance characterizes the relevant term from the text collection. Firstly, the sentences are extracted from the reviews. hen the POS agger is applied to separate out the nouns, noun phrases and adjectives. Next the candidate features are extracted by applying the syntactic rules designed for Standard English. For every candidate feature,the Intrinsic Domain Relevance (IDR) and Extrinsic Domain Relevance (EDR) scores are calculated by using Domain dependent and domain independent corpus respectively. a he interval threshold approach, called as IEDR Criteria is applied to confirm the final Opinion Feature in which the candidate feature having IDR score greater than IDR threshold, and EDR scores less than EDR threshold is checked . © BEIESP.

Abstract
Recently, the medical image processing is extensively used in several areas. In earlier detection and treatment of these diseases is very helpful to find out the abnormality issues in that image. Here there are number of methods available for segmentation to detect the lung nodule of computer tomography (CT) image. The main result of this paper, the earlier detection of lung nodules using Pre-processing techniques of top-hat transform, median and adaptive bilateral filter was compared both filtering methods and proved the adaptive bilateral filter is suitable method for CT images. The proposed segmentation technique uses novel strip method and the image is split into number of strips 3, 4, 5 and 6. A marker-watershed method based on PSO and Fuzzy C-mean Clustering method was proposed method. Firstly, the input image was reduced noise reduction and smoothing and the filter image is using strips method and then the image is segmented by marker watershed method. Secondly, the enhanced PSO technique was used to locate the better accurate value of the clustering centers of Fuzzy C-mean Clustering. Final stage, with the accurate value of centers and the enhanced target function and the small region of the segmented object was clustered by Fuzzy C-mean. In segmentation algorithm presented in this paper gives 95% of accuracy rate to detect lung nodules when strip count is 5. ©BEIESP.

Designing a feature vector for statistical texture analysis of brain tumor

(2019) *International Journal of Engineering and Advanced Technology*, 8 (5), pp. 1228-1230. Cited 198 times.

[a] Department of Information Technology, Bharath Institute of Higher Education and Research, Channai, India

Abstract
This paper presented a feature vector using a different statistical texture analysis of brain tumor from MRI image. The statistical feature texture is computed using GLCM (Gray Level Co-occurrence Matrices) of Brain Nodule structure. For this paper, the brain nodule segmented using strips method to implemented marker watershed image segmentation based on PSO (Particle Swarm Optimization) and Fuzzy C-means clustering (FCM). Furthermore, the four angles 0o, 45o, 90o and 135o are calculated the segmented brain image in GLCM. The four angular directions are calculated using texture features are correlation, energy, contrast and homogeneity. The texture analysis is performed a different types of images using past years. So the algorithm proposed statistical texture features are calculated for iterative image segmentation. These results show that MRI image can be implemented in a system of brain cancer detection. © BEIESP.

Abstract
Work-life balance is a broad concept including proper prioritizing between "work" (career and ambition) on one hand and "life" (Health, pleasure, leisure, family and spiritual development) on the other. This initiative was aimed at encouraging employers to adopt flexible working arrangements such as job sharing, flexi-time, compressed hours and others, to help their employees to achieve a better balance between the demands of paid employment and those arising from their private life. © BEIESP.

Abstract
Microwave filters are an important component in front end receiver of microwave communication system. They are used for passing frequency components within a particular pass band and to reject the interfering signal outside of that operating frequency band. Their functionality also includes to reject the unwanted product from the output of the mixers and amplifiers, and to set the IF bandwidth of the IF receiver. Important parameters include cutoff frequency, insertion loss, out of the band attenuation rate measured in dB per decade of the frequency. Filters with sharper cutoff frequency provide more rejection for out of the band signals. Insertion loss, measured in dB, is the amount of attenuation seen by signal through the pass band of the filter. Size requirement for most of the Personal Communication Systems require filters to be compact in size and wideband. This work presents design of Microwave filters in Global System for Mobile and Wireless Local Area Network Bands. Afterwards, a detailed analysis for designing filters with these requirements in presented. First, a Conventional T Shape Bandpass Filter is presented. Consequently, A Modification in T Shape MicrostripBandpass Filter is presented with considerable size reduction. © BEIESP.

Adaptive bilateral filter for multi-resolution in brain tumor recognition

(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (8), pp. 1371-1373. Cited 6 times.

[a] Department of Information Technology, Bharath Institute of Higher Education and Research, Chennai, India
[b] Department of Computer Science and Engineering, SRM University, Kattankulathur, India

Abstract
At present, the medical image processing is an important and development field. The various diagnosis of disease is CT, MRI and PET scanned image. These technologies are found to detect small defects in the human body. The main result of this paper, the earlier detection of brain tumor using Pre-processing techniques of median, bilateral and adaptive bilateral method was compared both filtering methods and proved the adaptive bilateral method is suitable method for MRI images. In Proposed, there are three main contributions are implemented in this filter method. (1)The extension of adaptive bilateral method to apply sub-bands of low frequency signal decomposed using wavelet transform. A wavelet threshold is combined with adaptive bilateral method to form an innovative structure in image de-noising method. It's very efficient to eliminate noise in original noisy images. (2) First detected block boundary and texture regions discontinuities to adapt or control the parameters of spatial and intensity in bilateral filter. The adaptive method can improve the restored image quality in this test result compared with standard bilateral filter. (3)The improvements of fast bilateral method using the combination of Gaussian filter. I proposed the various image resolution of adaptive bilateral method was proved better results. © BEIESP.

Abstract
Cloud computing (CC) is the most recent innovation in the advanced globe. CC is the current innovation in the meadow of conveyed computing. The reception of innovation is developing step by step since it encourages the clients to use the checks during utilizing mutual puddle of assets with no the establishment of every product. Since CC accumulates the information and it's dispersed assets in the earth, security has turned into the primary obstruction what is obstructing the organization of cloud situations. There is few clients' utilized cloud to accumulate their own information, so information stockpiling security is necessary on the capacity medium. The real worry of cloud condition is security amid transfer the information on cloud server. Yet, security is the basic inhibitor that is looked by CC and it utilizes CC progressively troublesome. To take care of these issues, few encryption calculations which give security to the information put away on cloud. In this research work, an exertion is completed to analyze the security issues and also encryption calculations that give security to the cloud information. © BEIESP.

Abstract
This paper reports the influence of dysprosium ion (Dy3+) substitution on the structural and magnetic properties of NiDyxFe2-xO4 (0.0 ≤ x ≤ 0.1) nanoparticles (NPs) prepared using a hydrothermal method. The structure and morphology of the as-synthesized NPs were characterized via X-ray diffraction (XRD), scanning and transmission electron microscope (SEM, and TEM) analyses.57Fe Mössbauer spectra were recorded to determine the Dy3+ content dependent variation in the line width, isomer shift, quadrupole splitting, and hyperfine magnetic fields. Furthermore, the magnetic properties of the prepared NPs were also investigated by zero-field cooled (ZFC) and field cooled (FC) magnetizations and AC susceptibility measurements. The MZFC (T) results showed a blocking temperature (TB). Below TB, the products behave as ferromagnetic (FM) and act superparamagnetic (SPM) above TB. The MFC (T) curves indicated the existence of super-spin glass (SSG) behavior below Ts (spin-glass freezing temperature). The AC susceptibility measurements confirmed the existence of the two transition temperatures (i.e., TB and Ts). Numerous models, e.g., Neel–Arrhenius (N–A), Vogel–Fulcher (V–F), and critical slowing down (CSD), were used to investigate the dynamics of the systems. It was found that the Dy substitution enhanced the magnetic interactions. © 2019, MDPI AG. All rights reserved.

Abstract
Fiber reinforced composites plays a major role in service sector and engineering field. This creates interest for the researchers towards natural fibers as reinforcement which is already a highly used reinforcement material in many of the non-structural applications. These materials are tailor-made materials with a different volume fraction of resin and fibers and the stacking sequence could be made unique for each application depends on the strength requirement. Therefore, whenever engineers try to use a new configuration the proposed laminate has to be tested for its mechanical performance, experimental testing of each new laminates is a time consuming and expensive process. This work is aimed at the comparison of mechanical performances of natural fiber, glass fiber and hybrid fibers reinforced with polyester resin. The laminates are prepared with flax and glass and also glass/flax hybrid fibers, their mechanical properties like tensile strength and flexural strength are experimentally tested and also analytically achieved using Finite element Analysis Method (ANSYS 16.2). All the tests are carried out on standard ASTM sized samples. The comparison shows analytical results are better than the experimental results and there is a deviation of 0.5 to 25% in the results between the two methods of testing. © TJPRC Pvt. Ltd.

Abstract
The general prerequisites of a part in the mechanical, automobile and aviation have given many testing conditions. New materials can be found and manufactured to some valuable segments. This work is directed to get a better understanding and portrayal of the dispersion holding of comparative and different metals. This work goes for building up a basic strategy to get diffusion bonding joints at generally not ease. In diffusion bonding, two metal surfaces are united into contact at expanded temperatures under strain for a specific timeframe. It also aimed to obtain optimum parameters for diffusion bonding of zinc coating over aluminium alloy plate and magnesium alloy. These two metals are jointed inside the die after finishing surface treatment. Then the die is kept inside the diffusion bonding machine by varying the time, temperature, pressure by means of load. Diffusion bonding equipment is fabricated and verified with experiments so that it is capable of rendering accurate diffusion bonding joints with facilities to measure parameters and to investigate the super plastic diffusion bonding joints with interlayer. This method is devised to study the mechanical and metallurgical characteristics of the joint. © TJPRC Pvt. Ltd.

Abstract
Major research is focused on fuel consumption and emission reduction in the past years. There is growing interest on alternative fuels due to volatile fossil fuel price and depletion. Utilization of transition metal additive in nanocrystalline form helps the combustion in molecular level and also reduces emissions and fuel consumption values. To forms a stable nano fluid metal oxide additive is added to biodiesel and ultrasonicated. The single cylinder, air cooled, and constant speed kirloskar engine is chosen for experimental study. The performance studies indicated the increase in thermal efficiency of 1% because the better mixing resulting secondary atomization and disruption of primary droplet containing additive and burns completely. Nearly 60% emission reduction was observed for 100% biodiesel at full load. © TJPRC Pvt. Ltd.

Abstract
Metal-semiconductor core-shell type Pd@SiO 2 nanoparticles (NPs) were successfully synthesized by Stober's method and the product was characterized by UV–vis, XRD, FT-IR, SEM, HR-TEM and EDX techniques. In vitro Photodynamic activity and DNA binding studies of Pd@SiO 2 core shell nanoparticles were studied. Cell viability of the core-shell nanoparticles against HeLa cell line was screened by MTT assay after exposing at different light doses. The outcome of the present study indicates that the core-shell Pd@SiO 2 NPs are highly stable and exhibited strong photodynamic efficiency under LED light illumination in HeLa cells. The results indicated that SiO 2 supported on the surface of Pd NPs not only prevented the aggregation in addition exhibited remarkable photodynamic activity. © 2019 Elsevier B.V.

Abstract

SrTm x Fe 12−x O 4 (0.00 ≤ x ≤ 0.10) hexaferrites (HFs) are produced successfully using a sol–gel approach. The structural, optical, and magnetic properties are investigated. The hexagonal phase is confirmed for all the products. The magnetization is measured with respect to the applied magnetic field, M(H). The magnetic parameters including saturation magnetization M s , remanence M r , squareness ratio (SQR = M r /M s), coercivity H c , and magnetic moment n B are deduced at room (300 K; RT) and low (10 K) temperatures. It is shown that the ferrimagnetic nature and Tm 3+ substitutions lead to decreases in the magnetization and coercivity magnitudes. The results on magnetic properties are investigated extensively with respect to the structural and microstructural properties. The SQR values indicate the formation of a single magnetic domain for the x = 0.0 sample and a multi-magnetic domain structure for the Tm 3+ -substituted Sr HFs (x ≥ 0.02). The obtained H c values suggest that the produced HFs are promising candidates for potential magnetic recording applications. © 2019 The Authors

Abstract

In this work, damages in composite materials are characterized using geometrical and Fourier-Hu shape descriptors. Digital images are acquired from the front and rear sides of composite materials after 5-, 6-, and 7-mm indentations. An anisotropic diffusion filter is used to remove the noise and to smooth the digital images. The global and local damages in the composite materials are segmented using K-Means (KM) clustering. Geometrical features and Fourier-Hu-based moments are calculated from the extracted regions. The global and local damages due to different indentations are classified using random forest (RF). Results show that the KM is able to segment the global and local damages with cluster centers three and four, respectively. The Fourier-Hu moment suggested that the damage dimension is high in the rear side compared with the front side. The Hu moment performed better compared with using geometrical features to characterize the damages. RF with both geometrical and Fourier-Hu moments performed better than the individual features. The image-based analysis performed in this study concludes effective characterization of damages; this framework can be applied in the nondestructive evaluation of composite materials. Abstract
Aerodynamic mixing characteristics of the elliptical throat of the convergent divergent nozzle with an identical circular exit of aspect ratio 3 were studied computationally and experimentally. To determine the aerodynamic characteristics during mixing, the pressure distribution and pressure profiles were calibrated along the major and minor axes. The pressure variation in the orifice and nozzle shows that the energy decay in the nozzle dissipates faster than the jet from the orifice. Moreover, we visualised the pressure oscillation of the nozzle and orifices is closer to each other. In addition to that, we have also seen that the energy decay of both jets is approximately close to one another. The mixing promoting capability decreases as the area of the elliptical throat and the pressure gradient of the nozzle decrease. The computational results are evaluated with experimental values. The jet bifurcation is captured using StarCCM+. © 2017, © 2017 Informa UK Limited, trading as Taylor & Francis Group.

Abstract
Titanium dioxide (TiO2) nanocomposites have been extensively employed in many fundamental optoelectronic and photocatalytic applications due to their outstanding optical, electronic and chemical properties. In the present work, we introduce a simple layer-by-layer approach to design a magnetic TiO2 nanocomposite that could be easily recycled using an external magnetic field without affecting its quantum efficiency. The crystallinity, size, surface area, stability, morphology, purity and other optical, thermal and magnetic properties of the composite have been investigated. Surface topology, thickness and thermal conduction were also demonstrated by AC conductivity measurements at a specific temperature (55 °C). Our results revealed that the prepared composite has a semi-spherical concentric shape with an average size of about (123.4 nm), surface area of (46.13 m2/g) and zeta potential of (− 24.3 mV) as confirmed by HRTEM, surface area analyzer and zeta potential measurements. TGA and DSC analysis recorded the thermal stability of the composite up to (500 °C) while a band gap of about (3.35 eV) has been calculated. VSM analysis showed that the composite has good magnetic properties. Atomic force microscopy recorded a surface roughness of the composite of about (125 nm) while the average thickness was approximately (10.3 nm). Significant responses of the capacitance–voltage profiles in the employed Preisach model, have been also recorded. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
In the present study, spinel copper ferrite (CuFe 2 O 4) nanoparticles (NPs) doped with different concentrations of rare earth element (REE) Cerium (Ce 3+) ions were synthesized by the simple sol-gel combustion technique. REE Ce 3+ ions were successfully doped into the spinel lattice of CuFe 2 O 4 NPs without any distortion. It was analyzed that the influence of Ce 3+ ions on structure, surface morphology, magnetic behavior and antibacterial activities using different instrumental techniques such as powder XRD, SEM, EDX, TEM, SAED and VSM, etc. Powder XRD results and SEM images along with EDX techniques confirmed the spinel phase formation of pure and Ce 3+ doped CuFe 2 O 4 NPs with spherical shaped morphology without any other secondary phase impurity. It also was further confirmed by TEM and SAED analysis. The magnetic behavior of the Ce 3+ doped CuFe 2 O 4 NPs was recorded using the VSM technique at room temperature (RT). The magnetic characterizations have been altered by the addition of Ce 3+ ions in the CoFe 2 O 4 lattice. The antibacterial properties of Ce 3+ doped CuFe 2 O 4 NPs was found to be enhanced with increase in Ce 3+ concentrations as it cause a reduction in the grain size. © 2019 Elsevier B.V.

Abstract

In the present research article, authors report on tailoring the dielectric properties of potassium dihydrogen phosphate (KDP) crystals using supersonic shock waves that is proposed and demonstrated. The present experimentation involves an investigation of loading single pulse of shock waves with different Mach numbers such as 1.7, 1.9, 2.2, 2.4 and 2.5 on KDP crystals using shock tube. The crystalline nature and dielectric behavior of pre and post shock loaded KDP crystals are evaluated by PXRD and impedance analyzer techniques, respectively. Interestingly, shock wave loaded test materials show low dielectric constant compared to pre shock test crystal. Moreover, Mach 1.9 shock wave loaded test crystal shows the lowest dielectric constant compared to other Mach numbers and it is due to the reduction of lattice polarization and domain orientation changes. The experimental results clearly show that the test crystal can be a potential material for microelectronic and optoelectronic applications because it acquires low dielectric constant on shock exposure. © 2019 IOP Publishing Ltd.

Abstract

Objective: The study aims to analyse and compare the efficacy of neck stabilization exercise and postural correction exercise over conventional exercises on pain, disability, posture, Respiratory dysfunction in desk job workers with neck pain. Background of The Study: Neck pain is a common disorder mainly caused by awkward posture, tightness in both the neck and upper back muscles and prolonged sitting while using computers, twisting and bending of the trunk. Rounded shoulder is a condition characterized by protracted shoulder girdle from its normal. Imbalance between agonist and antagonist results in muscle imbalance affecting the cervical curvature resulting in pain. Materials and Methods: Once the study is approved by Institutional Review Board Ref no: IV C – 018 / PHYSIO / IRB /2017-2018 50 samples were selected from 60 volunteers based on the inclusion criteria. The study was conducted is the outpatient department of physiotherapy & took nearly 3months (Jan 2018 – May 2018) to complete the study.. Group A received Neck Stabilization exercise and postural correction exercise with deep breathing exercise. Group B received stretch and strengthening exercise with deep breathing exercise. Pre and post-test measured with NDI-Neck disability index, CSBQ-Cervical Spine Bournemouth Questionnaire, SEBQ-Self-Evaluation Breathing Questionnaire, DST-Double square test. Result: On comparing Pre-test and Post-test within Group A and Group B on Double Square Test(Right and Left), Neck Disability Index, Cervical Spine Bournemouth Questionnaire, Self-Evaluation of Breathing Questionnaire shows significant decrease in the post test Mean values but Group A which has the Lower Mean value is more effective than Group B at P ≤ 0.001. © RJPT All right reserved.

Abstract
Background: Current century with advanced medical care still holds Tuberculosis as a prevalent condition around the world. The context to default is the adverse effects faced by patients taking anti-tubercular drugs. The most perilous among the adverse effect is hepatotoxicity and can be ameliorated by the effect of Nigella Sativa seeds. Objectives: To study the hepatoprotective role of Nigella Sativa seed extract against Isoniazid and Rifampicin induced hepatotoxicity. Materials & Method: The animals were divided into three groups with six animals in each group. Group I served as normal control, Group II served as positive control and received Isoniazid and Rifampicin for 10days. Group III received Isoniazid and Rifampicin with Nigella Sativa seed extract 900mg/kg was given for 10days. Blood samples where sent for AST, ALP, ALT analysis and the liver tissue for histopathology studies. Results: Table 2 showed decrease in AST, APL,and ALT values in group III when compared with group II. Histopathology showed reduced hepatotoxic changes in group III when compared with group II. Conclusion: The hepatoprotective property of Nigella Sativa seed extract will be a new path for safer and effective Tubercular therapy in developed and developing countries. © 2019, Indian Journal of Public Health Research and Development. Author Keywords
Hepatoprotective; Isoniazid; Nigella Sativa seed; Rifampicin; Tuberculosis

Index Keywords
alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, isoniazid, Nigella sativa extract, rifampicin; animal experiment, animal model, animal tissue, Article, black cumin, controlled study, drug effect, histopathology, liver cell, liver parenchyma, liver protection, liver tissue, liver toxicity, lymphocytic infiltration, nonhuman, steatosis, venous congestion

Chemicals/CAS
alanine aminotransferase, 9000-86-6, 9014-30-6; alkaline phosphatase, 9001-78-9; aspartate aminotransferase, 9000-97-9; isoniazid, 54-85-3, 62229-51-0, 65979-32-0; rifampicin, 13292-46-1

Abstract
Pattern recognition places an important role in partitioning the higher than mentioned issues. Pattern recognition analysis is complete provided that it acknowledges distorted document, which is deficient within the present analysis works. In all image pattern recognition, process, analysis and PC vision techniques Edge detection plays major role. In recent past pattern recognition directly deals pc vision systems, orientation and intensity info concerning edges as primary input for more process to document identification. This review provides a summary of the literature on the sting detection ways for pattern recognition. © BEIESP.

Enhanced social media metrics analyzer using twitter corpus as an example
(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (7), pp. 822-828. Cited 3 times.

[a] Bharath University, Chennai, India
[b] Vinayaka Mission's Research Foundation, AV Campus, Chennai, India

Abstract
Social media is the collection of online communications channels dedicated to community-based input, interaction, content-sharing and collaboration. Websites and mobile applications dedicated to forums, microblogging, social networking, social bookmarking, social curation, and wikis are most popular and different types of social media. Social media become an essential part of human life. In business, social media is used to market products, promote brands, and connect to current customers and foster new business.Online social media is ubiquitous in nature. It allows people to use short text messages to express their opinions and sentiments about products, events and other people. For example, Twitter is an online news and social networking service where users post and interact with short messages, called "tweets". Therefore, nowadays social media become a potential source for business to find people's sentiments and opinions about a particular event or product. Social media analytics is the practice of gathering huge amount of digital data generated online from blogs and social media websites and analyzing them to find the insights and make business decisions. This paper focuses on development of enhanced social media metrics analyser using various latest methods and algorithms with the help of R language and R tool. © BEIESP.

Abstract
Due to rapid proliferation of WSN, the application of wireless devices or nodes and usage of mobile computing devices changed the shape of network security. One of the field which need the most security is Mobile Ad hoc Network (MANET). The term ad hoc itself ensures that there is no central entity in order to govern the nodes. The issue of security is a critical problem when implementing mobile ad hoc networks (MANETs) is widely acknowledged. The traditional method of firewall and encryption is not sufficient to protect the network. Therefore an intrusion detection system must be added to the mobile ad hoc network. One of the different kinds of misbehavior a node may exhibit is selfishness. A indiscipline or selfish or node wants to protect own resources when using the services of others and consuming their resources. Malicious nodes that disobey the standard, degrades the performance of well-behaved nodes significantly. One way of preventing selfishness in a MANET is a detection and exclusion mechanism. In this paper, we de-scribe different method for detecting indiscipline or malicious nodes in mobile ad hoc network. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract

Stress is an unavoidable phenomenon which disturbs the physiological homeostasis. Noise is the highest encountered stressor that affects the wellbeing of mankind. Hippocampus, a region of the brain crucial for memory is highly influenced by stress and thereby deteriorates memory. Male albino Wistar rats of 11-12 weeks were used in this study. Nelumbo nucifera (NNE) 400 mg/kg body weight (BW) and its active principle Quercetin (QRCT) (40 mg/kg bw) were administered orally to the animals 10 days before noise stress exposure of (100dB 4h/d). Ability to retain information by Learning and spatial memory was assessed using eight-arm radial maze apparatus. It was observed that after noise stress exposure errors in working, reference memory and time period to move into all baited arms were increased; however, the drug pre-treated animals showed a decrease in all the above parameters. The observations in the present work have proved that NNE and QRCT groups were effective in ameliorating the noise stress-induced changes, but the active component quercetin group had a higher protective impact on the changes. © 2018 Pharmascope Publications. Abstract
In this study, series of superconductor-tungsten oxide (WO 3) nanoparticles composites, YBa 2 Cu 3 O 7-δ /(WO 3) x , were produced via the solid-state reaction process. The structural, morphological, chemical compositions, electrical and magnetic properties were investigated using X-ray diffraction (XRD), scanning electron microscope (SEM) along with EDX system and physical properties measurement system (PPMS), respectively. The XRD, SEM and EDX analyses showed the successful formation of the Y-123 orthorhombic phase. The electrical resistivity measurements proved the occurrence of superconductivity in different samples. The magnetic results showed an improvement of critical current density (J c) and pinning ability in WO 3 nanoparticles added Y-123 products. The dominant pinning mechanisms and the strength of pinning centers in various sintered products were examined and discussed. The measurements of zero-field-cooled (ZFC) and field-cooled (FC) magnetization versus temperature (M-T) indicated an increase in the magnitude of diamagnetic signal with the addition of WO 3 nanoparticles in the Y-123 superconductor. © 2018 Elsevier Ltd and Techna Group S.r.l.

Abstract
In this present study, we made an attempt for the different concentration of rare earth element (REE) Cerium (Ce3+) doped cobalt ferrite (CoFe2O4) nanoparticles (NPs) were prepared by the simple sol-gel combustion technique. Cerium was successfully substituted into the spinel lattice without any distortion. It was analyzed the effect of Ce3+ ions doping on structural, morphological, magnetic properties and antibacterial activities using the various instrument techniques. Powder XRD and SEM along with EDX studies confirmed the pure phase formation Ce3+ doped CoFe2O4 NPs and spherical shaped agglomerated nanoparticles morphology without any other impurity. The well resolved broad peaks in the XRD pattern clearly indicated the nanosized, single phased, cubic spinal nature of these samples. There was a substantial decrease in the crystallite size on doping with Ce3+. A more in-depth morphological study was facilitated using the TEM and SAED analysis. TEM investigation revealed random shaped, sharp edged nanoparticles with a normally facetted morphology. The presence of distinctive diffractions spots on the SAED pattern indicated the formation of nanoparticles that are highly crystalline in nature. The magnetic response of the Ce3+ doped CoFe2O4 NPs was recorded at room temperature (RT) using the VSM technique. The magnetic properties have been seen to be altered by the addition of Ce3+ in the CoFe2O4 matrix. The decrease in the saturation magnetization (Ms, emu/g) with the increase in Ce3+ content rendered the synthesized sample applicable in field of antenna construction. This change will be also suitable for reducing the size of the antenna. The antibacterial activity of Ce3+ doped CoFe2O4 nanoparticles was found to be enhanced with increase in Ce3+ doping level as it cause a reduction in the grain size. © 2018 Elsevier B.V.

Abstract
The current study investigates the impact of vanadium substitution on the structural, magnetic, and optical properties of NiFe2−xVxO4 (x ≤ 0.3) nanoparticles (NPs) produced by the cost-effective sol-gel route. The as-prepared spinel ceramic powders were examined by X-ray diffraction (XRD), UV-visible diffuse reflectance spectroscopy (DRS), Fourier transform infrared (FT-IR) spectroscopy, scanning electron microscopy (SEM), and vibrating sample magnetometry (VSM). The functional groups, spinel phase, and crystal structure were confirmed by XRD and FT-IR, respectively. The crystallites size decreased from 45.24 to 36.56 nm as the doping process increases. The plots of Tauc were drawn to determine optical band gap magnitudes of 1.291, 1.302, and 1.312 eV for x = 0.0, 0.2, and 0.3, respectively. The estimated saturation magnetization is maximum for pristine NiFe2O4 NPs and decreases to minimum for NiFe1.7V0.3O4 NPs. The σ-H hysteresis loops have finite coercivity (between 125 and 169 Oe) and retentivity (between 9.36 and 14.04 emu/g) values. The calculated σr/σs ratios are lower than 0.500, assigning the uniaxial anisotropy for NiFe2−xVxO4. The effective anisotropy constants (Keff) are in the range of 0.824 × 105 and 1.303 × 105 Erg/g. The magnetocrystalline anisotropy field (Ha) values are around 5.0 kOe. The characteristics of hysteresis (σ-H) curves and the order of magnetic data reveal the soft ferrimagnetic feature of as-prepared nanoparticle samples. From Mossbauer analysis, the variations in hyperfine magnetic field, quadrupole splitting, line width, and isomer shift have been evaluated. The distribution of cations showed that the octahedral B sites are occupied by all the ions of V3+. Mossbauer spectra are composed of four Zeeman sextets and one doublet. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
Graphene–tantalum oxide (Ta 2 O 5) hybrid material is synthesized using a simple hydrothermal method to elucidate its optical properties. The prepared sample is characterized by X-ray diffraction, scanning electron microscope (SEM), high-resolution–transmission electron microscope (HR-TEM), thermo-gravimetric and differential thermal analysis (TG-DTA), Fourier transform–Raman spectra, and photoluminescence (PL) studies. SEM and HR-TEM analysis revealed that the Ta 2 O 5 particles are embedded on the surface of thin sheets of well-defined graphene structure. Thermogravimetric analysis has provided substantial evidence for the thermal stability of the material with minimal percentage of weight loss at 700°C. Further, the excitation of the nanocomposite at a wavelength of 280 nm leading to emission spectra at 567 nm using PL studies, which clearly indicates the emission of light, occurs in the visible green region. © 2019 Optical Society of America.

Abstract

Oils play a putative choice for alleviating various symptoms associated with bone-related disorders. In this present study, polyurethane (PU) scaffold encompassing with Mahua oil (MO) and propolis (PP) were developed using the electrospinning technique. Morphological analysis showed the reduction in the diameter of the electrospun scaffold with blending of MO and MO/PP into the PU matrix. The strong interactions between PU, MO, and PP were evident through the infrared spectrum and thermal analysis. The wettability results showed the hydrophobic nature in electrospun PU/MO scaffold and hydrophilic behavior in electrospun PU/MO/PP scaffold. Mechanical testing indicated the enhancement in the strength of the PU due to the addition of MO and PP. Moreover, the fabricated scaffolds exhibited nontoxicity, low hemoglobin release and improved blood clotting time as evident in the coagulation studies. The cell proliferation studies showed the enhanced fibroblast cell adhesion in the developed nanocomposites than the pristine PU. Hence, the fabricated PU scaffolds blended with MO and PP having desirable properties can serve as a valuable candidate for bone tissue repair. © 2019, © 2019 Taylor & Francis Group, LLC.

Abstract
This study shows the potential effect of EGCG in DCM induced rats by exerting anti- hyperglycemic, anti-hyperlipidemic and anti-fibrotic effects. Hence EGCG a natural occurring compound have important clinical implications in terms of prevention and progression of diabetic cardiomyopathy. © RJPT All right reserved.

Abstract
Occurrence of free radicals causes oxidative damages in the tissues of man while antioxidants block the assault of the free radicals reducing the risk of diseases. The aim of the present study is to investigate the antioxidant activities of the ethanol, chloroform, petroleum ether and aqueous extracts of Biophytum sensitivum. The ethanolic extracts of B. sensitivum exhibited the highest antioxidant activity (52%) than that of the chloroform (40%), aqeuous (24%) and Petroleum ether (21%) extracts. All the extracts of B. sensitivum exhibited a significant antioxidant activity against DPPH free radicals. The hydroxyl radical activity ranged from 23% to 63%. The ethanolic extract of B. sensitivum indicated the highest antioxidant capacity (63%) against hydroxyl free radical which showed almost a higher antioxidant activity than that of the ascorbic acid which is a known positive control. The overall nitrous oxide scavenging ranged from 26 %to 46% activity among the extracts of B. sensitivum. Similarly the ethanolic extract of B. sensitivum indicated 46% activity while chloroform extract showed (38%) scavenging activity against NO- free radical. The ABTS activity of B. sensitivum extracts ranged from 27% to 51%. Amid the ethanolic concentrates of B. sensitivum, 51% of ABTS indicated free radical scavenging activity, which was superior to that of the standard antioxidant ascorbic acid action. © 2019 Connect Journal.

Author Keywords
Antioxidant activity; Biophytum sensitivium; DPPH assay; NO assay; Reactive oxygen species

Index Keywords
alpha tocopherol, antioxidant, Biophytum sensitivum extract, catalase, chloroform, flavonoid, hydroxyl radical, molybdenum, nitric oxide, petroleum ether, phosphomolybdenum, plant extract, reactive oxygen metabolite, trolox C, unclassified drug, uric acid; ABTS radical scavenging assay, antioxidant activity, Article, Biophytum sensitivum, controlled study, DPPH radical scavenging assay, drug efficacy, free radical scavenging assay, hydroxyl radical scavenging assay, medicinal plant, nitric oxide scavenging assay, nonhuman, oxidative stress, oxygen radical absorbance capacity, phytochemistry

Chemicals/CAS
alpha tocopherol, 1406-18-4, 1406-70-8, 52225-20-4, 58-95-7, 59-02-9; catalase, 9001-05-2; chloroform, 67-66-3; hydroxyl radical, 3352-57-6; molybdenum, 7439-98-7; nitric oxide, 10102-43-9; petroleum ether, 8032-32-4; trolox C, 56305-04-5; uric acid, 69-93-2

Funding details
The authors thank the R&D Wing, Sree Balaji Medical College and Hospital for providing the adequate laboratory facility to complete the study successfully

Abstract
We put forward a tree regularization, which empowers numerous tree models to do feature collection effectively. The type thought of the regularization system be to punish choosing another feature intended for split when its gain is like the features utilized in past splits. This paper utilized standard data set as unique discrete test data, and the entropy and information gain of each trait of the data was determined to actualize the classification of data. Boosted DT are between the most prominent learning systems being used nowadays. Likewise, this paper accomplished an optimized structure of the decision tree, which is streamlined for improving the efficiency of the algorithm on the reason of guaranteeing low error rate which was at a similar dimension as other classification algorithms. © BEIESP.

Static analysis of spur gear for varying correction factors and module

(2019) *International Journal of Recent Technology and Engineering*, 7 (6), pp. 6-10.

[a] Department of Mechanical Engineering, Bharath University, Selaiyur, Chennai, Tamil Nadu, India
[b] GKM College of Engineering and Technology, New Perungalathur, Chennai, Tamil Nadu, India

Abstract
The aim of the paper is to find the deflection induced in a spur gear for different correction factors and different modules applied during working conditions. Firstly a standard gear is to be designed for the materials cast iron and sintered steel. The dimensions of the standard gear were determined for various modules using which the modeling was carried out using pro-E modeling software. Similarly the dimensions of the profile corrected gear were also determined for various correction factors. All models were exported to software hyper mesh where the models are meshed properly up to a high degree of accuracy. Then the meshed part is exported to another software ANSYS where analysis part was carried out to get the results. A comparison was carried out theoretically and analytically for cast iron gears are studied for various modules and various correction factors with which we conclude for the optimum method to reduce deflection in gears. © BEIESP.

Study on failure morphology and water absorption behavior of natural fiber reinforced hybrid composite laminate
(2019) *International Journal of Recent Technology and Engineering*, 7 (6), pp. 14-17.

[a] Department of Mechanical Engineering, Bharath Institute of Higher Education and Research, Chennai, Tamil Nadu, India
[b] Department of Mechanical Engineering, Sathyabama Institute of Science and Technology, Chennai, Tamil Nadu, India

Abstract
The natural fiber reinforced composites are now gaining more importance in research and development as a new potential material for industrial and commercial applications. However the strength of the material mainly depends on the bonding strength between the resin and the fiber. This work aimed to determine and compare the bonding strength of different types of natural fiber reinforced epoxy composite. Hybrid fiber reinforce composites are prepared with glass , kenaf and aloe vera fiber and their tensile tested sample's failure morphology and their water absorption behavior are studied .Tensile test Specimens are cut from the fabricated laminate and tested according to the ASTM D638 standards. The failure analysis is done using scanning electron microscope (SEM).From the result we understood that the fiber pull out is more in aloevera/glass hybrid composite and better bonding between the resin and the fibers is shown in Kenaf /glass hybrid composite. The water retardation of kenaf fiber composite is also better than aloevera fiber composites. © BEIESP.

Comparison of heat deflection behaviour of alkali treated and untreated hybrid fiber reinforced composites
(2019) *International Journal of Recent Technology and Engineering*, 7 (6), pp. 11-13. Cited 1 time.

[a] Department of Mechanical Engineering, Bharath Institute of Higher Education and Research, ChennaiTamil Nadu, India
[b] Department of Mechanical Engineering, Sathyabama Institute of Science and Technology ChennaiTamil Nadu, India

Abstract
Natural Fiber reinforced composites finds place in many applications as they have the advantages of being light, strong, cheap and more environmental friendly. This study aimed to determine the effect of alkali treatment on natural fiber and its impact on the heat deflection behaviour of the natural and glass fiber reinforced hybrid composites ,in this work two type of hybrid composite are made with glass, sisal and flax fiber ,the hybrid fiber reinforced composite laminates were fabricated by hand lay-up method. Specimens are cut from the fabricated laminates and their heat deflection behaviour was tested according to ASTM D648 standard. From the result it is understood that the alkaline treatment has improved the heat withstanding capacity of sisal/glass hybrid composite by 20C in average and don't have much effect on flax /glass hybrid composite. © BEIESP.

Design and completion of asymmetric single phase 27 level cascaded mli for various pwm scheme

(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (6), pp. 792-797. Cited 39 times.

[a] Department of EEE, Bharath University, Chennai, Tamilnadu, India
[b] Department of EEE, Mailam Engineering College, Mailam, Tamilnadu, India

Abstract
Multilevel inverter is most fashionable due to bargain switching losses, short costs, minimum harmonic distortion and hug voltage capacity while compared with conventional PWM converters. A latest family of multilevel inverters that has decreased number of separated input DC sources had emerged named as asymmetric multilevel inverter. In this work, theories and use of a variety of PWM modulation schemes for twenty seven level asymmetric multilevel inverters are tested. The relative case study is offered to authenticate the tested modulation scheme through harmonic spectrum analysis, magnitude of output voltage, Total harmonic distortion (THD), and distortion factor (DF). The demonstration of chosen single phase trinary DC source multilevel inverter is established through MATLAB-SIMULINK based simulation. Finally then the experimental result shows that APOD PWM offers AC output with relatively low harmonic distortion. It's also realized that COPWM strategy is originate to perform superior since it delivers relatively higher fundamental RMS AC output voltage. © BEIESP.

Brain image segmentation for multi-resolution using neural network and categorization of human brain images
(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (6), pp. 930-933.

[a] Bharath Institute of Higher Education and Research, Chennai, India
[b] SVS Groups of Institutions, Warangal, India

Abstract
The Brain image segmentation for Multiresolution is utilized by means of neural network for categorization of human brain images. It is recognized that the image is skilled by weights which is distributed to the image for the extraction of the improved image of very low resolution to very high resolution. As this process, it is guaranteed the differentiability and continuity of the inaccuracy function. The Bilateral filtering smoothes brain images by preserving edges, by resources of a non-linear grouping of close by brain image values. This coalesce gray levels or colours based on together their geometric proximity and prefers in close proximity to values to distant values in both range and domain. The bilateral –neural projection process is proposed to work out the problems related with the unique one, when it is practically applied to single image, the original innovative neural projection algorithm can diminish the inaccuracy efficiently under certain critical conditions. Then, the design of bilateral filtering is engaged to guide the neural-projection process and to categorize the human brain images. The brain image edge information is incorporated to stay away from crosswise edge projection that the inaccuracy effect can be isolated and categorise the brain Image. © BEIESP.

Comparative analysis of liver segmentation using K-means, fuzzy C-means and spatial Fcm using mumford shah approach

(2019) *International Journal of Recent Technology and Engineering*, 7 (6), pp. 99-104.

[a] BHARATHIAR UNIVERSITY, Coimbatore, 46, India
[b] Dept. of MCA, Bharath Institute of Higher Education and Research, Selaiyur, Chennai, India

Abstract
In medical environment, liver segmentation plays ansignificant role by helping physicians to find the location of affected region of the liver from the normal part. Automatic extraction which is recognized as segmentation by computer processing may diminish the burden as well as time consuming. To overcome the burden of identification of definite organ segmentation technique is used. In general liver analysis have done through CT scan or MRI scan whereas the image of MRI scan is utilized for the complete process which is more convenient than other scanning while diagnosing. This does not create harmful to human body due to no practice of radiation. As the initial stage, image segmentation has been done through spatial fuzzy clustering which can control level of its parameter to set advancement as a result in the fuzzy clustering. In this advanced technique, mumford shah technique is used to improve the robustness with less time consumption. This study has motivated on both less time extraction and also the accuracy. So, in order to attain spatial fuzzy clustering is proposed and also compared with the existing clustering algorithm such as K-means, Fuzzy C-Mean (FCM) to evaluate the performance efficiency in time extraction using clustering outcomes. © BEIESP.

Stock prediction scrutiny using artificial neural network
(2019) *International Journal of Recent Technology and Engineering*, 7 (6), pp. 105-108.

[a] Bharath University, Chennai, India
[b] Dept. of Computer Science, Sindhi College, Chennai, India

Abstract
This paper is based on the survey of neural networks in predicting stocks price in the market. The stock market prediction helps in identifying the investment decision before investing on different companies. Neural networks offer the capability to determine the outlines in the market prediction. Common stock market details and artificial neural network techniques are discussed. The study reports how neural networks leave behind the current techniques. The imminent ways for relating neural networks to the stock markets are discussed by forming survey table. Finally, future directions for applying the artificial neural networkto the stock markets are discussed. © BEIESP.

Software fault prediction exploration using machine learning techniques
(2019) *International Journal of Recent Technology and Engineering*, 7 (6), pp. 109-113. Cited 1 time.

[a] Bharath University, Chennai, India
[b] Computer Science Department, Govt. Arts College (Men), Nandanam, Chennai, India

Abstract
Fault prediction is one of the major activity of quality assurance. Fault prediction plays a significant role in the reduction of software cost and time. Even though, there are so many prediction techniques that are available in software engineering there is a need for stable software fault prediction methodology. In this research work, four types of Machine Learning techniques such as supervised, unsupervised, semi-supervised, and reinforcement learning are discussed. According to the study, to predict the fault, a fusion of classification and reduction Machine Learning technique is necessary. This report also introduces hypothesis set for fault prediction taxonomy. © BEIESP.

Abstract
In clinical research studies complex end points are most common. Especially in studies on diseased patients undergo therapy, a relapse can occur, or patients can die after relapse or without former relapse (death). Sometimes, endpoints can be reasonably combined in a composite endpoint, as relapse and death combined into disease-free survival (DFS). In this case, standard survival techniques, as Kaplan–Meier estimation of the DFS probability, can be applied. Often, interest focuses on endpoints for which competing risks are present; a competing risks model plays a special case of a multistate model. A more complex multistate model is required when the effects of events occurring in the course of the study on further disease progress. Another endpoint of interest is time to experience multiple episodes; the multistate model used for analysis must be adapted for this event structure.The aim of this report is to explain use and interpretation of both non proportional hazard Cox (non PH) and proportional hazard Cox (PH)type multistate models for the suitability of assessing different covariate effects in situations of multiple endpoints and also different baseline hazard assumptions in a comparison manner for the European Group for Blood and Marrow Transplantation (EBMT) competing risks data. © 2019, Indian Journal of Public Health Research and Development. Abstract
To investigate the phytochemical properties, in vitro antioxidant and in vivo safety profile of leaf extracts of Tragia plukenetii (TP). Methods: TP leaves were obtained from the south part of India (Guntur District, Andhra Pradesh) and it was extracted with different solvents (Benzene Extract (BE), Chloroform Extract (CE) and methanolic extract (ME)). These TP extracts were analyzed for the in vitro antioxidant activity by DPPH reducing power, β-carotene-linoleic acid complex and iron chelation assays followed by in vivo acute oral and dermal toxicities using Swiss mice and Wistar rats respectively. Results: The present study results revealed ME exhibited an effective and powerful antioxidant activity when compared to a standard antioxidant, Butylated hydroxytoluene (BHT). ME was found to be effective in DPPH, β-carotene-linoleic acid complex and iron chelation assays respectively. In vivo acute oral toxicity study revealed that mice treated with up to 5000 mg/kg of BE, CE and ME did not show any signs of toxicity. Furthermore, similarly, acute dermal toxicity study demonstrated that BE, CE and ME did not exhibit any signs of dermal toxicity up to 1000 mg/kg in rats. Conclusion: TP extracts possess an excellent antioxidant activity with a devoid of any signs of acute oral and dermal toxicities. © 2019 Phcog.Net.

Octagonal Nantenna for Space Research Applications
(2019) *6th IEEE International Conference on "Smart Structures and Systems", ICSSS 2019*, art. no. 8882805, .

DOI: 10.1109/ICSSS.2019.8882805

[a] Department of CSE, BIHER, Chennai, India
[b] Department of CSE, Saveetha Engineering College, Chennai, India

Abstract
An octagonal nantenna has been proposed in this paper. The antenna is of 8x14x0.324 mm3 dimension and operates at 101.71 GHz frequency finding W-Band applications. The proposed nantenna gives a gain of 6.155dB and efficiency 98.6%. The antenna uses Rogers RT5880 substrate with copper platings on both sides. The terahertz response of the antenna makes it to use in space research applications. © 2019 IEEE.

Abstract
Aragwadharishtam is an Ayurvedic preparation used mainly to detoxify the body. Its main use is in the cure of skin diseases, ulcers and piles. The present study deals with the GC MS analysis of Aragwadharishtam to know the presence of phytochemicals present in this medicine. The GC MS profile indicated the presence of some very important molecules such as Phnylethyl alcohol, Ethyl hydrogen succinate, Butanedioic acid diethyl ester, 4-Ethyl-2-hydroxycyclopent-2-en-1-one, Eugenol, Ethyl gallate, 1,2,3- Benzenetriol, Benzeethanol,4-hydroxy-, Hexadecanoic acid, 2-hydroxy -1-(hydroxymethyl) ethyl ester and Octadecanoic acid, 2,3-hydroxypropyl ester etc. These molecules have a number of important medicinal roles which could substantiate their participation towards the medicinal activity of Aragwadharishtam as a detoxifying formula as claimed by Ayurveda. However, further work in this direction is warranted to prove the medicinal efficacy of the medicine. © RJPT All right reserved.

Abstract
Big data analytics progressively takes over the universe, and the prediction tends to take advantage of Big data analytics to yield the incredible results. The deep learning algorithms procure higher priority than the machine learning in the prediction systems. The traditional weather prediction exploits the observations of prevailing atmospheric conditions that accumulate simultaneously either from the trained observers or the numerical prediction model. However, the weather forecasting is an arduous task due to the dynamic and uncertainty of data. The proposed system plans to use the neural network for weather forecasting to overcome these shortcomings. Recently, the Long-Short Term Memory (LSTM) network based weather forecasting has gained popularity in machine learning. It significantly reflects the superior ability to model the temporal data sequences along with the long-term dependency through the memory blocks. However, on account of memory blocks along with the loop structure leads to over fitting issues. In order to tackle this issue, this work presents FORcasting Environmental data Through Enhanced LSTM and L1 regularization (FORETELL) that extends the existing LSTM model with the two methods such as optimal neuron selection method and the regularization method. The optimal neuron selection method constitutes the FORETELL system, as it can learn the complex data sequences without longer period and overfit of data. Instead of processing the entire vast feature of the data sequence, the regularization method captures the potential features to avert the overfitting constraint that ensures the noise-free system with more excellent performance. Conclusively, the FORETELL is evaluated using the weather dataset to demonstrate the superior performance than the existing Sequence to Sequence Weather Forecasting (SSWF) method. © BEIESP.

Abstract
Today, behaviour of women employees has changed the environment of the private organization. Young women employees always ready to switch over whenever she dissatisfy with any reason in the job. Retention strategy is a powerful recruitment tool. Private organizational issues matters as lost knowledge and training time. HR managers should identify the needs of the women employee and then devises the retention strategies. As different individuals have different priorities does not fit one strategy. HR professionals face the vital challenge to retain talented women employees. Retention strategies are fall into four categories-job enrichment, salary, working conditions and education, addressing these issues this article demands a specialized approach that emerge new fangled women friendly policies which foster gender neutral workplace in developing retention strategies. © 2019, Indian Journal of Public Health Research and Development. Abstract
Despite the major advancements women have made in becoming a significant part of the workforce, they are still facing important career development issues. Although many women achieve lower and middle management positions, they seem to hit the “glass ceiling” in many organizations and are denied the most senior levels of upper management. The reasons are multi-dimensional; some women lack the confidence to apply for senior positions; some lack the necessary education or training; and others find themselves excluded from the top positions because of systemic gender bias that exists in some companies. There are plenty of statistics tracking the percentage of women in the workforce, their qualifications and their salaries. But the data doesn’t show us the whole picture. It doesn’t assess how women feel, how they fare in their day-to-day business, the challenges they encounter. And that is why the research embarked on a global task, asking more than 9,500 women across the G20 to identify the top five issues faced at work especially in IT industry. © 2019, Indian Journal of Public Health Research and Development. A feedback loop between microRNA 155 (miR-155), programmed cell death 4, and activation protein 1 modulates the expression of miR-155 and tumorigenesis in tongue cancer

Abstract
MicroRNA 155 (miR-155) is an oncomir, generated as a noncoding RNA from the BIC gene whose promoter activity is mainly controlled via activation protein 1 (AP-1) and NF-B transcription factors. We found that the expression levels of miR-155 and programmed cell death 4 (Pdcd4) exhibit inverse relationships in tongue cancer cells (SAS and AWL) and tumor tissues compared to their relationships in normal FBM cells and normal tongue tissues, respectively. In silico and in vitro studies with the 3= untranslated region (UTR) of Pdcd4 via luciferase reporter assays, quantitative PCR (qPCR), and Western blotting showed that miR-155 directly targets Pdcd4 mRNA and blocks its expression. Ectopic expression of Pdcd4 or knockdown of miR-155 in tongue cancer cells predominantly reduces AP-1-dependent transcriptional activity of the BIC promoter and decreases miR-155 expression. In this study, we demonstrate that miR-155 expression is modulated by a feedback loop between Pdcd4, AP-1, and miR-155 which results in enhanced expression of miR-155 with a consequent progression of tongue tumorigenesis. Further, miR-155 knockdown increases apoptosis, arrests the cell cycle, regresses tumor size in xenograft nude mice, and reduces cell viability and colony formation in soft-agar and clonogenic assays. Thus, the restoration of Pdcd4 levels by the use of molecular manipulation such as using a miR-155 sponge has an essential role in the therapeutic intervention of cancers, including tongue cancer. Feasibility and Safety of Split-Liver Transplantation in a Nascent Framework of Deceased Donation

(2019) *Liver Transplantation*, 25 (3), pp. 450-458. Cited 6 times.

Abstract
Split-liver transplantation (SLT) is a valuable option for optimizing the use of good-quality deceased donor grafts. It is not routinely reported outside the West because of limited deceased donor numbers, technical and organizational constraints, lack of experience, and a predominant living donor liver transplantation (LDLT) practice. At our center, 20% of the liver transplantations (LTs) are from deceased donors. We report our experience of SLT and compare outcomes with pediatric and adult LDLT recipients. A prospectively maintained database of all LT recipients between September 2009 and March 2017 was analyzed. Each pediatric SLT recipient was matched to 2 pediatric LDLT recipients for age, weight, urgency, and year of transplant. Each adult SLT recipient was similarly matched to 2 adult LDLT recipients for age, Model for End-Stage Liver Disease score, and year of transplant. Intraoperative and postoperative parameters, including recovery time, morbidity (biliary and vascular complications, Clavien grade >IIIA complications), and mortality were compared. In total, 40 SLTs were performed after splitting 20 deceased donor livers (in situ, n = 11; hybrid split, n = 3; and ex vivo, n = 6). Recipients included 22 children and 18 adults. There were 18 livers that were split conventionally (extended right lobe and left lateral segment [LLS]), and 2 were right lobe–left lobe SLTs. Also, 3 LLS grafts were used as auxiliary grafts for metabolic liver disease. Perioperative mortality in SLT recipients occurred in 3 patients (2 children and 1 adult). Incidence of vascular, biliary, and Clavien grade >IIIA complications were similar between matched adult and pediatric SLT and LDLT groups. In conclusion, SLT is an effective technique with outcomes comparable to living donor grafts for adult and pediatric recipients. Using SLT techniques at centers with limited deceased donors optimizes the use of good-quality whole grafts and reduces the gap between organ demand and availability. Abstract

This study reports the preparation and characterization of nanocrystalline spinel powder of cubic copper ferrite nanoparticles (NPs) which have been fabricated via a cost-effective citrate sol–gel approach. The structural and morphological properties of the nanoparticles are analyzed by X-ray diffraction (XRD), Fourier transform spectroscopy (FT-IR), and scanning electron microscopy (SEM) whereas magnetic properties and Mössbauer analysis were performed using vibrating sample magnetometer (VSM) and Mössbauer spectra, respectively, and were characterized in detail. The empirical aim of this study is to perceive the transition phase of CuFe 2 O 4 as cubic symmetry which was confirmed by SEM images, and a couple of studies reported on the cubic structure of copper ferrite and discussed the magnetic properties. However, the present study gives the detailed information of the formation of cubic structure and magnetic behavior of the CuFe 2 O 4 cubic structure. X-ray diffraction measurements of resulting NPs show that the grain size of the particles is about 42.08 nm while SEM analysis showed that the particles have cubic nanostructured shapes with non-homogeneous sizes in around 80–100 nm. From 57 Fe, Mössbauer parameters consist of one superparamagnetic doublet and superposition of four sextets. VSM result shows the enhanced superparamagnetic nature of the CuFe 2 O 4 NPs. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Research on the impact of work life balance on employee performance among middle level managers in it industry
(2019) *International Journal of Engineering and Advanced Technology*, 8 (3 Special Issue), pp. 684-690.

[a] Department of Management Studies, Bharath Institute of Higher Education and Research, Chennai, TN, India
[b] SRM Arts and Science College, Trichy, TN, India

Abstract
Employee Work Life Balance (WLB) is a major driver in the organization that helps to achieve higher productivity. It is a healthy blend of both employee's work life and personal life. There are many factors influencing work-life balance of an employee in the organization. Work life balance is now increasingly becoming the focal point of study by HRM experts and by managing teams of corporate. It is about effectively managing the balance between paid work and other activities like spending time with family, taking part in sport and recreation, undertaking further study. Earlier Companies attract and retain candidates by just providing effective training or Job security. But many employees in 21st century see 'Work life balance policies'- as a critical factor for selecting the companies. As employee conclusions are quite logic that it is easier to find a new job than finding a new spouse or a family. © BEIESP.

Secure Data Aggregation to Preserve Data and Key Privacy in Wireless Sensor Networks with Multiple Sinks
(2019) *2019 Proceedings of the 3rd International Conference on Computing and Communications Technologies, ICCCT 2019*, art. no. 8824992, pp. 86-93. Cited 1 time.

DOI: 10.1109/ICCCT2.2019.8824992

Abstract
Reliable and trustful data aggregation is an important to be addressed in Wireless Sensor Networks (WSNs). In this paper, we proposed a new technique to protect key and data in data aggregation called Secure Data Aggregation to Preserve Data and Key Privacy in Wireless Sensor Networks with Multiple Sinks (SAPDKP). The multiple sinks concepts used in this method consume less energy in the computational and communicational overhead. The security issues such as data confidentiality, data integrity, data freshness and data authentication are preserved in this technique. It uses very simple technique to perform aggregation and encryption. The multiple sink nodes perform analysis to identify the distrustful group and retransmission of data takes place for that group. Our simulation result proved that implementation of SAPDKP decreases the communication overhead and energy consumption compared with existing work. The multiple sinks concept increases the reliability of data and also reduces the number of data transmission in the network. © 2019 IEEE.

Abstract
The present study of GC MS analysis of one Ayurvedic formulation, Khadirarishtam, was undertaken to know the types of biomolecules present in it. This medicine is used to treat chronic skin ailments. The GC MS profile of Khadirarishtam indicated the presence of some important biomolecules such as Eucalyptol, Phnylethyl alcohol, Ethyl hydrogen succinate,.alpha.-Terpineol, 5-Hydroxymethylfurfural, Acetic acid, chloro-,3-phenylpropyl ester, Eugenol, Benzeethanol,4-hydroxy-, Propanoic acid, anhydride, Benzoic acid, 4-hydroxy-, Disulphide, methyl (methylthio)phenylmethyl, Hexadecnoic acid, 2-hydroxy-1-(hydroxymethyl) ethyl ester, Octadecanoic acid and 2,3-dihydropropyl ester etc. These biomolecules have been reported to have the medicinal properties which represent those of Khadirarishtam. Further study to establish the molecular mechanism of these compounds is warranted. © RJPT All right reserved.

Abstract
The present study deals with the GC MS analysis of one Ayurvedic prepaation, Vasakadyarishtam, which is a mucolytic medicine used for the treatment of cough, cold, chest congestion asthma and related diseases like bronchitis, inflammation and hemoptysis. The most important constituent of this medicine is Vasaka or Adhatoda vesika plant, which is known for its anti-cough and cold usage in Ayurveda. This study was to understand the main biomolecules present in this medicine by GC MS analysis. The results indicted the presence of some important molecules such as Eucalyptol, Phenylethyl alcohol, Camphor, Ethyl hydrogen succinate, Succinic acid, cyclobutyl ethyl ester, 3-Cyclohexen-1-ol,4-methyl-(1-methylethyl)-(R)-,. alpha.-Terineol, 5- Hydroxymethyl furfural, p-Anisic acid,4-nitrophenyl ester, 2-Propen-1-0l,3-phenyl, Benzeneethanol, 4-hydroxy- Propiophenone, 2'-(trimethylsioxy)-, Hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester and Octadecanoic acid and 2,3 -dyhydroxypropyl ester. These molecules are known for their various medicinal properties which indicate their roles in this formulation. © RJPT All right reserved.

Author Keywords
Adhatoda vesika; Alpha.-terineol; Camphor; Ethyl hydrogen succinate; Eucalyptol; Phenylethyl alcohol; Vasakadyarishtam

Index Keywords
(4 methoxyphenyl)(2 nitrocyclohexyl)methanol, 2 propen 1 ol 3 phenyl, 3 cyclohexen 1 ol 4 methyl (1 methylethyl), 5 hydroxymethylfurfural, alpha terineol, ayurvedic drug, benzeneethanol 4 hydroxy, camphor, cineole, ethyl hydrogen succinate, hexadecanoic acid 2 hydroxy 12 hydroxy 1 yl ester, octadecanoic acid 2,3 dyhydroxypropyl ester, para anisic acid 4 nitrophenyl ester, phenethyl alcohol, propiophenone 2' (trimethylsioxy), succinic acid cyclobutyl ethyl ester, unclassified drug; Article, Ayurveda, mass fragmentography

Chemicals/CAS
5 hydroxymethylfurfural, 67-47-0; camphor, 464-49-3, 76-22-2, 8008-51-3; cineole, 470-82-6, 55962-72-6; phenethyl alcohol, 60-12-8

Abstract
With the fast growth in e-commerce, surveys for famous products on the web have grown rapidly. Although these reviews are significant in making decisions, it is difficult to read all reviews. Automation of emotion mining method was the well-known answer to the dilemma. Although there are algorithms for emotion mining, an algorithm with evolving accuracy is needed. An algorithm which extracts product traits from surveys based on traits frequency and generates a view on item traits is developed and tested on downloaded buyer review. The sentences were tagged, sentiment words were extracted and view orientations were identified using the semantic orientation of notion terms. The precision values for traits extraction and both precision and recall values for view orientation recognition were significantly improved by the proposed algorithm.

An improved location based routing protocol for WSN using novel location proximity algorithm
(2019) *International Journal of Recent Technology and Engineering*, 7 (5), pp. 329-334.

[a] Department of Computer Science and Engineering, Bharath Institute of Higher Education and Research, Chennai, Tamil Nadu, India
[b] Department of Computer Science, Pondicherry UniversityPondicherry, India

Abstract
The main characteristics of Wireless Sensor Network (WSN) include its: dynamic changing topology, multihop connections between the nodes and an effective dynamic routing protocol. These concerns are addressed in current research and it aims to improve the effective utilization of nodes in WSN. To improve the location search information of next hop, a novel Location Proximity (LP) search algorithm is used. Hence, proposed system addresses the concerns related to high energy consumption in WSN network characteristics under balanced and unbalanced network condition. The simulation results proved that proposed method fits well to changes in network than conventional algorithms. Also, the proposed method adopts well to dynamic change in network that results in increased throughput (23%) with improved lifetime (10%)and reduced energy consumption (reduced to 78%). © BEIESP.

Abstract
The degree of packet dissemination among the mobile nodes of the network depends on the reliability of each individual mobile node attributed towards the benefits of the other interacting nodes in forwarding activity. However, the selfish intent of selfish nodes in the network reduces the performance in terms of packet forwarding rate. Thus, the influence of selfish intent in the network need to be minimized to the maximum level by introducing a predominant isolation process. In this paper, a Gwet Kappa Reliability Factor-based Selfish Node Detection Technique (GKRF-SNDT) scheme is proposed for superior detection of selfish nodes in the network. This proposed GKRF-SNDT scheme inherently derives the advantages of Gwet Kappa Reliability Factor for quantifying the degree of trust possessed by each mobile nodes interacting in the network. The experimental investigations of the proposed GKRF-SNDT scheme confirmed a superior throughput rate of 18% with reduced energy consumptions of 21% compared to the existing selfish intent isolation approaches. Abstract
The problem of bio molecular computing has been well studied and there are number of approaches discussed for the detection of false gene sequences. However, they suffer to achieve higher performance in the detection of false sequences. To improve the performance of detection of fake molecular patterns, an pattern based approach is discussed in this paper. As of the biomolecular strings a set of patterns, the method first identifies the list of sequences available and based on the set of patterns being maintained, the method identifies the list of patterns present in the gene sequence. Based on the sequences, the method identifies the incomplete and fake sequences and performs insertion and deletion using matrix operations. The method maintains number of patterns for the matrix insertion and deletion operation. For each pattern available, the method compute the bio molecular sequence weight. Finally a single sequence has been selected and based on the selected pattern, the method performs insertion and deletion operation. The proposed method produces efficient results on the detection as well as correction. Copyright © 2019 American Scientific Publishers All rights reserved

Abstract
High performance computing (HPC) is a part of period that focuses on joining the power of figuring devices. HPC created because of increment sought after of handling pace. At some phase in pervious innovation HIPC applications have constantly required huge no of PCs interconnected in a network together with group. Groups are hard to set up and keep both in fact and monetarily. It will turn out to be less confounded to introduce hip bundles inside the cloud without stressing over the expenses related with it additionally convey ensures at the phenomenal of contributions (Qos). It enables ordinary's question wind up more quick witted and intelligent. The goal of the utilization of cloud principally based HIPC is to address quicker handling of immense measure of data and higher throughputs for all multiplicities of certainties and information. Cloud in HPC decreases the expense of framework and programming program and numerous others. It manages entire guarantee to the data to get right of passage to autonomously and sufficiently. Issues in cloud concur with jail issues, confidentiality, Authenticity, Authorization and well being. © 2019 American Scientific Publishers

Abstract
The trustworthiness of the mobile nodes is considered as the predominant parameter for ensuring significant data dissemination in the ad hoc network. However, the selfishness activity of the mobile nodes minimizes the trust of the mobile nodes by dropping a considerable number of data packets in the network. The significant dropping of data packets by the selfish node introduces huge data overhead with increased latency and energy consumptions by increasing the number of retransmissions. In this paper, a Bates Distribution Inspired Trust Factor-based Selfish Node Detection Technique (BDITF-SNDT) is proposed for predominant detection of selfish behavior by investigating multiple levels of factors that contribute towards effective selfishness detection. This proposed BDITF-SNDT approach is also potent in enhancing the detection rate of selfishness through the multi-perspective analysis of each monitored mobile nodes' forwarding characteristics towards the benefits of the other interacting mobile nodes. The simulation experiments and results of the proposed BDITF-SNDT approach is determined to be enhanced on an average by 16% and 14% superior to the compared selfish node isolation approaches existing in the literature. Abstract
This paper proposes an idea to develop security applications in vehicular ad hoc network (VANET) need upon propagation the security based messages. A self-arranging MAC protocol is proposed for high-collisions situations. The protocol permits vehicles to sort with others in a collision warning way before information transmission. Vehicles in the waiting line will get to the channel by time-division multiple accesses (TDMA) based channel access. A queue determine the accessing the channels on queue based channel access to on one node access from all nodes. Distinction with completely random access, the slot of queue select access the channel needs on completion time of self-sorting operation. In this paper queue achieve self sorting process mainly determined identify and avoid the collisions with another list areas during they self sorting operations. This simulation results output main purpose for highways securities show the proposed methodologies can considerable decrease the packet loss and delay in collision warning system in highway collisions situations. © 2019 American Scientific Publishers.

Abstract
This demo will show the important thing capabilities of a Platform as-a-provider (PaaS) we've proposed in a research paper widely wide-spread for presentation at IEEE LANMAN 2016 conference. The proposed PaaS allows IoT packages provisioning in hybrid cloud/fog environments. Two desires are assigned to the demo. On the one hand, we will highlight how IoT programs may be provisioned in such environments. However, we will display concretely the benefits those hybrid environments have over conventional cloud environments. The provisioning in these hybrid environments permits latency discount and processing performance enhancement. Certainly, a good way to lessen latency, the programs can have a number of its additives strolling in cloud and interacting with the other additives going for walks within the fog, toward IoT devices. Abstract
Information and communication technology achieved mass improvement on ATMs cyber-security but there is a strong need to strengthen all parts of operation. ATM skimmers are card readers that collect the data from magnetic card stripe that is attached to the real payment terminals; especially criminals can create cloned cards to steal money from the bank account. After these also we think that ATM is the safest place. But, nowadays in ATM, robbery happens easily by damaging the system for money. In this paper we bring an idea about biometric based system to enhance security. There is signal processing which alerts the police and gives information to bank. © 2019 American Scientific Publishers All rights reserved

Ameliorative effect of withaferin a on ageing-mediated impairment in the dopamine system and its associated behavior of wistar albino rat

(2019) *Pharmacology*, 103 (3-4), pp. 114-119. Cited 7 times.

DOI: 10.1159/000495510

Abstract
Withaferin A (WA) was evaluated for its neuro-protective efficacy on ageing induced striatal dopamine (DA) and behavioural changes in aged rats. Wistar albino rats were divided into group I - young (3 months), Group II - aged (24 months), Group III - aged rats supplemented with WA (50 mg/kg b.w once in a day for 30 days) and Group IV - young rats supplemented with WA (50 mg/kg b.w). The HPLC assay revealed significant decline in the levels of DA and homovanillic acid (HVA) in substantia nigra (SN) and striatum (ST) of aged rat. A marked decline in motor activity of aged rat was observed through open field, beam walking and grid walking motor experiments. These results indicate that ageing reduces nigro-striatal activity as well as nigro-striatal DA levels. Interestingly, the administration of WA (50 mg\kg b.w) resulted in a substantial resurge of DA and HVA in SN and ST and a significant reversal of motor impairment in aged rats. This study is the first report that evidently determines the neuro-protective efficacy of WA on dopaminergic system of SN and ST in aged rats. © 2018 S. Karger AG, Basel.

Abstract
The addition of nanosized entities into the superconducting matrix is a practical way for increasing the performance of host YBa2Cu3O7-d (noted Y-123) compound. In this study, series of Y-123 samples with WO3 nanowires (noted NW-WO3) as additives were produced via the solid-state reaction method. The structural, morphological, chemical compositions, electrical and magnetic properties were thoroughly investigated using X-ray diffraction (XRD), scanning electron microscope (SEM) along with EDX system and physical properties measurement system (PPMS), respectively. The critical current density (Jc) and flux pinning force density (Fp) were extracted from the measurements of magnetization. The XRD, SEM and EDX analyses showed the successful formation of the Y-123 orthorhombic phase. The electrical resistivity measurements proved the occurrence of superconductivity in these samples. The magnetic results showed higher critical current densities and flux pinning ability in NW-WO3 added Y-123 products. The dominant pinning mechanisms and the strength of pinning centers in various sintered products were examined and discussed. © 2018 Elsevier Ltd and Techna Group S.r.l.

Abstract

Abstract: Liquid crystal (LC) has long been a feature in Materials Science and Nanotechnology, have recently been extended into the appealing domain of complex hybrid materials. The crystalline structural effects of alkoxy chain lengths and the mesogen properties of hydrogen-bonded (n-OBASA) complexes (n = 5,6,7) have been investigated in recent studies. The LC-based hybrid nanocomposite materials–obtained by the homogeneous dispersion of zinc oxide nanowires (ZnO NWs) as a dopant into hydrogen-bonded liquid-crystalline compounds—seem to be particularly promising in this article. Optimizing the geometry of surface stabilizing electro-optic, LC cell reveals the typical intermolecular hydrogen bond (H-bond) formation. Here, we explore molecular-colloidal hybrid composite matrix formed from LCs and dilute dispersions of orientation-ordered ZnO NWs, for eventual potential application in smart switchable display devices. In addition, we investigated the structural, dielectric and optical properties of the nanocomposite, and electro-optical studies which were performed by exploiting the potential during the conditions before the opening of spectrum acquisition. Our novel findings confirm that the electric field induces a charge transfer of the LC molecules to the nanomaterial, which acts as a trap for ionic charges. This effect may be utilized to achieve superior switching operation that is electro-optically tunable. Such dynamic novel switching could be harnessed in smart LCD technology and pave the way towards innovative display modulation techniques. Abstract
The development of Lithium batteries has gained more attention nowadays. polyethylene oxide (PEO)/Polyvinyl pyrrolidone (PVP) based Solid polymer electrolytes (SPEs) was prepared with lithium bromide by solution casting technique. From the X-ray diffraction studies, the amorphous nature of the polymer blend with the inclusion of LiBr had been studied. FT-IR study was used to find the presence of functional groups and the complex formation between the bonding of polymers. The maximum ionic conductivity was found to be 1.59 × 10−6 S/cm for PEO (30 wt %)/PVP (70 wt %)/Lithium bromide (4 wt %) at 303 K within the frequency range of 42 Hz - 1 MHz. The dielectric response of the SPE systems was studied at the temperature range of 303–363 K. An important factor of ion conduction is the relaxation behavior of polymer chains which was clarified by the dielectric properties of the SPE systems. Further, the capability of the polymer to dissolve salt was determined by the dielectric constant (ε). At lower frequencies, the higher dielectric permittivity was attained due to deposit of ionic charges. The ionic movement enhances the dielectric loss and dielectric permittivity. The conductivity relaxation process and the ion hopping mechanism have been explained by using the Electric modulus analysis. © 2018 Elsevier B.V.

Abstract
A series of N-formyl-2,7-diphenyl-1,4-diazepan-5-ones 11–15 are synthesized in significant yields (86–92%) from their corresponding 2,7-diphenyl-1,4-diazepan-5-ones 6–10 using acetic-formic anhydride. Synthesized compounds 11–15 are characterised by their analytical and spectral (IR, Mass, 1D & 2D NMR) data. All the N–formyl compounds 11–15 show doubling of NMR signals due to the existence of syn and anti rotamers at RT which are unambiguously assigned by HETCOR spectra and ASIS method. The preferred conformation has been arrived by considering the chemical shifts, coupling constants, dihedral angles and destabilizing strain factors. The N-formyl-2,7-diphenyl-1,4-diazepan-5-ones 11–15 are best accommodated in a coplanar orientation of formyl function and flattened boat conformation of the ring where the phenyl groups are occupying pseudo-axial orientations in solution state. Further, dynamic NMR study is carried out for 14 from 28 °C to 116 °C and the calculated average energy barrier is 84.4 kJ mol−1. The single crystal X-ray diffraction study on N-formyl-2,7-diphenyl-1,4-diazepan-5-one 13 shows that the molecule adopts distorted boat conformation with coplanar orientation of formyl group. © 2018 Elsevier B.V.

Abstract
Multilevel inverters (MLIs) are an imperative solution for high power and high voltage applications. The MLIs can be classified into two categories such as symmetric and asymmetric. The asymmetric type MLIs has large number of output voltage steps with less number of input DC voltage sources and switching devices. In this paper, a single phase asymmetric (trinary sequence DC source) Cascaded H-Bridge MLI has been developed using unipolar PWM control schemes. The topology can produce 27-level output voltage with the help of 12 switches and 3 DC sources. It has been examined with a diverse combination of multicarrier unipolar PWM control. The PWM control includes Phase Disposition (PDPWM), Alternative Opposition Disposition (APODPWM), Carrier overlapping (COPWM), and Variable Frequency (VFPWM). The harmonic content of output voltage for each technique has been observed with different modulation indices. The demonstration of proposed topology for generating 27-level output voltage has been tested through simulation in MATLAB-SIMULINK and verified with laboratory-based experimental setup. From the results, it is evident that the APODPWM offers quality output voltage with relatively low harmonic distortion. Also, it has been observed that COPWM performance is superior since it delivers relatively higher fundamental RMS output voltage. © 2019 The Author(s).

Abstract
Yttrium doped tin oxide and Tin doped yttrium oxide nanoparticles were prepared by using Solanum nigrum plant extract. The obtained nanoparticles were confirmed by XRD and SEM. The antimicrobial activities of green synthesized nanoparticles were studied by using Bacillus subtilis. Yttrium doped tin oxide and Tin doped yttrium oxide nanoparticles show better antimicrobial activity than yttrium oxide and tin oxide. © 2019 Elsevier Ltd.

Abstract
Ground water samples were collected from different areas in Ariyalur District, Tamil Nadu. Twelve groundwater samples were collected and analysed for physico - chemical parameters such as pH, Electrical Conductivity, Total Dissolved Solids, Calcium, Magnesium, Total Hardness, Bicarbonate, Chloride, Nitrate and Sulphate in order to understand the different geochemical processes affecting the groundwater quality. The analytical data were compared with WHO standards. Water quality index is used to predict the water quality. The analytical results indicate that the majority of groundwater samples are found to be unsuitable for drinking purpose. © 2019 Elsevier Ltd.

Enhanced catalytic activity of new di-site onium salt in the kinetics of a-Tolunitrile monoalkylation
(2019) *Materials Today: Proceedings*, 36, pp. 848-852. Cited 1 time.

Abstract
In this study, we investigate in detail the catalytic efficiency of 1,4-bis-(ethylmethyleneammounium chloride)-2,5- dimethoxy benzene, BEMACDB (multi-site phase transfer catalyst) by observing the pseudo-first order kinetics of mono-alkylation of a-Tolunitrile (ATN). The formation of product was monitored by GC. The comparative study of catalytic efficiency of the new catalysts with single-site salts reveals higher catalytic activity for new catalysts under varying experimental conditions ([BEMACDB], [Base], [ATN], Stirring Speed and Temperature). By understanding the kinetics of mono-alkyaltion, we further establish the experimental parameters that influence reaction conditions. With the support of kinetic data we establish the suitable mechanism for monoalklation of ATN. The catalyst shows consistent catalytic activity in the C-alkylation of ATN in different experimental conditions. © 2019 Elsevier Ltd.

Abstract
A series of ZnO nanoparticles were synthesized by a biosynthesis method. The as-obtained products were characterized with powder X-ray diffraction (XRD), scanning electron microscopy (SEM), Fourier transform infrared spectroscopy (FTIR), Photoluminescence (PL) and Raman spectra. The ZnO nanoparticle exhibited superior photocatalytic activities for indigo carmine degradation under visible light irradiation. In addition, the photocatalyst exhibits high stability and reusability. © 2019 Elsevier Ltd.

Abstract
Biosynthesis of metal oxide nanoparticles using plant attracted great interest recently, due to its eco friendliness. Therefore, in the present study involves the synthesis of cerium oxide nanoparticle by using Brophyllamdaigremontianum plant ethanolic extract. The obtained powder was subsequently calcinated at 600 °C. Synthesized cerium oxide nanoparticles was confirmed by X-ray diffraction, Scanning electron microscopy, High resolution transmission electron microscopy, UV visible spectroscopy, Fourier transform infrared spectroscopy and Brunauer Emmett-teller (BET) measurement. To evaluate the anticancer activity of the spherical structured CeO2-Nps, it was tested towards the normal (L6) and breast cancer cell (MCF 7). It was found that Biosynthesized CeO2-Nps showed better cytotoxicity against cancerous MCF 7 cell line compared to normal L6 cell line due to its smaller size and high surface area. © 2019 Elsevier Ltd.

Abstract
Corrosion behaviour of mild steel in 2 N Sulphuric acid with Cloxacillin as corrosion inhibitor has been studied by using weight loss, Potentiodynamic polarization, Electrochemical impedance spectroscopy, Hydrogen permeation and diffuse reflectance spectroscopic studies. All these techniques reveal that inhibition efficiency increases with the increase in the concentration of inhibitor. Scanning electron microscopy (SEM) was carried out to characterize the surface morphology of the metal. Polarization studies indicated that inhibitor behaved as cathodic inhibitor. Diffuse reflectance spectroscopy confirmed the adsorption of inhibitor on the mild steel surface obeying Langmuir adsorption isotherm. A chemoffice 3D simulation technique was used to run the quantum mechanical analysis and established correlations between different types of descriptors and measured corrosion inhibition efficiency for inhibitor. The quantum chemical analysis substantiates the inhibition efficiencies of the compound determined by electrochemical methods. © 2019 Elsevier Ltd.

Electric Car: A Research Impact BY Means OF Scientometric Analysis
(2019) *Library Philosophy and Practice*, 2019, . Cited 3 times.

[a] Ayya Nadar Janaki Ammal College, Sivakasi, India

Abstract
The day-to-day increasing costs of petrol and diesel and to control the air pollution makes an impact to do a scientometric analysis on the research ouput on “Electric Car”. Therefore, the research publications indexed in Web of Science for 28 years have been downloaded from 1991 to 2018 for the analysis. The research reveals that a total of 2424 publications is published during the above-mentioned year. The regression test proves that the deviation among the data is low and has possibility to calculate the doubling time on the basis the last 14 years. The doubling time proves that the growth of publications increased from year after year. Journal articles played a dominant role among other type of publications. The language “English” played prominent role than the other language publications on “Electric Car”. Tang T.Q. published 15 publications and ranked first among the other authors. The Lotka’s Law does not fit the author productivity of the publications published on “Electric Car”. Eventhough, the research publications are increasing from year after year, the number of publications published in the past is not up to remarkable. At the same time, only a very few countries have been implemented the “Electric Car” throughout the world. It is therefore, suggested that the funding agencies, sponsoring bodies and global research and development ministries to encourage the researchers to do many more research on “Electric Car”, to enhance the control of air pollution by means of reducing the consumption of Petrol and Diesel, which will also support the cost control for better economy of the global countries. © 2019, Library Philosophy and Practice. Abstract
The domain of Biomaterials has provided a vast scope for research and development and this work is one such effort to develop a Bio Hybrid Composite that is bio degradable and hence eco-friendly with enhanced mechanical properties as well. The present investigation is on fabrication and evaluation of mechanical properties of Bio Hybrid Composite with different natural fibres-flax fibre woven mat, Aloe Vera fibre woven mat, and sisal fibre that are used as reinforcing lamination materials bonded with epoxy resin. This hybrid composite is prepared by the hand lay-up process and the experimental tests for tension, flexural, impact, and hardness are carried out in accordance with ASTM standards. The prepared composite material is also analysed by Finite Element Analysis Method (ANSYS 16.2) and the obtained analytical results are compared with real time experimental values. © 2019 Elsevier Ltd.

Abstract
Natural fibers along with reinforced plastic material gain a positive approach for the development of green composites to meet the demands which prevail in contemporary life. In this work, natural fiber, sisal and natural mats made of flax and aloe vera are used to produce the composite materials by hand laying method as the natural FRP composites are lightweight, strong and biodegradable and have the potential to be used in various automotive, furniture and architectural applications. This paper deals with the study of woven flax, aloe vera and sisal fibre and with the choosen fibre, sisal and mats, flax & aloe vera, two different specimens are prepared using epoxy resin as binder and by varying the positioning of fibre mats. The testing of mechanical properties of the fabricated hybrid composite is done to identify the high strength hybrid bio composite material and the influence of positioning of fibre mats. © 2019 Elsevier Ltd.

Abstract
The present study measures the three antioxidant assays, namely, ABTS, DPPH and FRAP by standard protocols for one ayurvedic medicine, which is used to treat diseases like to treat weak digestion, vomiting, diarrhoea, indigestion, dysentery, irritable bowel syndrome etc. The IC50 value for ABTS radical scavenging effect of Kutajarishtam was found to < 0.156 µg/ml and the standard drug, Ascorbic acid was 208.87 µg/ml. The IC50 value for DPPH radical scavenging assay of Kutajarishtam was found to be 1.968 µg/ml and the standard drug, Ascorbic acid was 8.158 µg/ml. The concentration of standard, ascorbic acid was taken as 5, 10, 20, 40, 80, 160 and 320 µg/ml while concentration of sample, Kutajarishtam was taken as 0.156, 0.3125, 0.625, 1.25 and 2.5 µg/ml. This variation in concentration was undertaken to have a clear understanding of its antioxidant property. The results indicate very good antioxidant activities of Kutajarishtam and this could be one of its important medicinal mechanisms. © Copyright International Knowledge Press. All rights reserved.

Abstract
Objective: Verification of the herbal plants by latest scientific tools toward understanding the molecular mechanism underlying their medicinal role is the need of the hour. Methods: Gas chromatography–mass spectrometry study of water extracts of the leaves of one herbal plant, Aristolochia indica was undertaken by standard procedures and its medicinal activity was verified with the biomolecules present in it. Results: The presence of some important biomolecules such as 2-propenoic acid, ethenyl ester, oxalic acid, cyclobutyl ethyl ester, phosphoric acid, 2-chloroethenyl dimethyl ester, pentanoic acid, 2-methylcyclohexyl ester, cis-, butylphosphonic acid, butyl cyclohexylmethyl ester, octadecanoic acid, 2,3-dihydroxypropyl ester, acetic acid, cesium salt and 2-Fluoro-6-trifluoromethylbenzoic acid, 4-nitrophenyl ester, and some others indicate represents the medicinal roles of this plant as is reported ethnopharmacologically. Conclusions: The results and discussion above clearly indicate that the various molecules present in A. indica leaf extracts do have medicinal roles ascribed to it and further work in this regard is on. © 1994 Rockefeller University Press. Abstract
Objective: The scientific validation of ethnopharmacologically important herbal plants by latest techniques is necessary to understand their medicinal efficacy. Methods: Gas chromatography–mass spectrometry study of one herbal plant, Dodonaea viscosa var. angustifolia was undertaken by standard procedures and its medicinal activity was verified with the biomolecules present in it. Results: The presence of some important biomolecules such as catechol, N-benzyl-2-phenethylamine, acetic acid, 4-oxocyclohexyl ester, 4-amino-3-mercapto-1,2,4-triazole, 1,1'-methylene-bis(di-2-propenylamine), inositol, alanine, N-methyl-N-methoxycarbonyl-, hexyl ester, 1,3-dioxolane, 2-methyl-2-pentyl-, cyclohexane, 1-methyl-3-(1-methylethenyl)-, cis-, phthalic acid, di(2,3-dimethylphenyl) ester, heptafluorobutyric acid, 2-naphthyl ester, and 2-fluoro-6-trifluoromethylbenzoic acid, 4-nitrophenyl ester has biochemical properties which represent the ethnomedicinal roles of this plant. Conclusions: The presence of these biomolecules having medicinal properties supports the validity of the medicinal roles of D. viscosa var. angustifolia. © 2019 JPR Solutions. All rights reserved.

Abstract
Objective: There is an urgent need to substantiate scientifically the roles of contemporary and native medicinal practices. This exercise will open up a new class of drugs which could be cheap, easily affordable, and with less or no side effects. Moringa oleifera or drumstick is known to a wonder herbal plant and most of its parts are used to cure various ailments. The present study deals with the gas chromatography-mass spectrometry (GC-MS) analysis of M. oleifera seeds and to understand the molecules present therein. Methods: GC-MS was performed on the water extract of the dried seeds of the plant by standard procedures. Results: Some important biomolecules such as 2,5-dimethyl-4-hydroxy-3(2H)-furanone, p-cresol, l-Norvaline, N-ethoxycarbonyl-, nonyl ester, Pentanoic acid, 2-hydroxy-, ethyl ester, 1H-1,2,4-Triazole-1-carboxamide, 5-acetylamino-3-amino-, Ethyl 2-hydroxybenzyl sulfone, beta-l-Arabinopyranoside, methyl, tetradecanoic acid, 10,13-dimethyl-, methyl ester, cyclohexane, 1-isopropyl-1-methyl-, decanoic acid, 2-methyl-, 2-Methylthiolane, S,S-dioxide, 4-Methyl-2,4-bis(4'-trimethylsilyloxyphenyl)pentene-, 2,4(1H,3H)-Pyrimidinedione, 6-iodo-5-methyl-, 2-Fluoro-6-trifluoromethylbenzoic acid, and 4-nitrophenyl ester have medicinal roles comparable with the various medicinal activities of Moringa seed water extract. Conclusion: It is concluded that the Moringa seed is a potential candidate for drug designing for many diseases. © 2020 SOLEN s.r.o.. All rights reserved.

Abstract
The Automated Teller Machine has transformed into an imperative bit of our general public. Utilizing the ATM anyway can frequently be a baffling encounter because of inclined glitches that happens in the machine. ATM makers have exhibited a few diverse mistake codes which starting at yet have not increased standard acknowledgment. This paper examines the different error codes thrown by various ATM machines produced by different manufacturers can be given a common code for very similar malfunctions made by the machine. Thereby to justify these common codes could gain world wide acceptance with the usage of the machines. © 2019 IAEME Publication.

Optimal reactive power dispatch with series and shunt facts devices using sine cosine algorithm

(2019) *International Journal of Advanced Research in Engineering and Technology*, 11 (1), pp. 90-109. Cited 5 times.

DOI: 10.34218/IJARET.11.1.2020.012

Abstract
Management of reactive power resources is essential for the secure and stable functioning of power systems in the standpoint of voltage stability. The principal aim of optimal reactive power dispatch (ORPD) is to detect the settings of control variables such as the voltage rating of generators, reactive power injection of VAR compensators and tap ratios of the tap setting transformers in order to decrease the grid congestion with one or more objective of minimizing the active power loss for a fixed economic power schedule while meeting a given lot of constraints. In this paper, Flexible AC Transmission System (FACTS) controllers named as Unified Power Flow Controller (UPFC) is added with conventional ORPD problem for active power loss minimization with voltage profile improvement. Also, this paper demonstrates the application of sine cosine algorithm (SCA) to discover the optimal solution of ORPD (with UPFC) of power system with different test systems (IEEE 57-bus and IEEE 118-bus) with distinct cases such as minimization of active power losses and improvement of voltage profile. Simulation results show the high quality and accuracy of the proposed algorithm, and considering the quality of the solution obtained, the proposed algorithm appears to be efficient and robust to solve the ORPD problem comparing with existing literatures. © 2019 IAEME Publication.

Abstract
LinkedIn Talent Insights will enable enrollment specialists to look by aptitudes, area, and even school, social enlisting (otherwise called social procuring and web based life enlistment) is utilizing electronic life stages, for instance, Twitter and LinkedIn to expose occupations, find capacity, and talk with potential chooses about association culture. It is compelling for discovering latent applicants. This paper presents the Future trends in recruitment with SMAC - social, versatile, examination and cloud technology on one incorporated stack, where each capacity empowers another to augment their impact. This is the new endeavor IT model conveying an association that is increasingly connective, shared, continuous and profitable. The model is anticipated to improve business aggressiveness. The cooperative energy of all these four advancements develops advancement with low overheads and high reach. SMAC, is making another period where the conventional strategies are being supplanted by the cutting edge ones. So as to remain refreshed with current innovation and drive income through the computerized eco-space, SMAC is picking up stimulus making new position openings, reforming how trade happens and changing how rivalry influences the market. © 2019 IAEME Publication.

Abstract
The Internet has been in presence for more than 40 years now and the expression "Internet of Things" (IoT) has been being used since huge scale appropriation of RFID started 10 years back. IoT empowers things to convey about themselves and their condition with different things and PCs and enable them to take an interest in business procedures and regular day to day existences of individuals. Many financial frameworks have fulfilled the 2FA necessities by sending a One Time Password (OTP), something had, through a SMS to the client's telephone gadget. Unfortunately, universal roaming and SMS expenses and delays put restrictions on this system reliability. It gives a stage to correspondence between objects where items can compose and oversee themselves. By analyzing current technology research and by investigating future application situations for the Internet of Things, this paper will feature out its potentially huge advantages in the cash logistics and ATM operations. © 2019 IAEME Publication.

Abstract
Serum lactate dehydrogenase (LDH) is a marker of cellular necrosis and is elevated in oral potentially malignant disorders, Oral Submucous Fibrosis (OSMF). Serum LDH levels have been used as a valuable biochemical marker in diagnosis of OSMF. To evaluate and compare the levels of serum LDH and haemoglobin in OSMF with normal healthy individuals. Two mL of venous blood was collected by under aseptic conditions and serum was separated from the normal healthy control subjects (Group 1, n= 22) and the OSMF (clinically and histopathologically confirmed cases) patients (Group 2, n= 22). Quantitative estimation of serum LDH and haemoglobin was performed. Significant rise was observed in the serum LDH levels (518.14 ± 48.62 IU/L) while the mean Hb levels (11.3 ± 1.14) were decreased in patients with OSMF in comparison with normal healthy individuals (LDH: 189.77 ± 28.30 IU/L, Hb: 12.94± 0.98 gm%) (P value < 0.0001, < 0.0001). Serum LDH and Hb estimation would serve as a valuable biochemical marker in the diagnosis of OSMF. © 2019

Asymmetric single phase impedance source cascaded multilevel inverter by using variable frequency pulse width modulation

(2019) *Journal of Advanced Research in Dynamical and Control Systems*, 11 (7), pp. 212-218.

[a] Department of Electrical and Electronics Engineering, Bharath University, Chennai, India
[b] Department of Electrical and Electronics Engineering, Mailam Engineering College, Mailam, India
[c] Department of Electrical and Electronics Engineering, Krishnasamy College of Engineering and Technology, cuddalore, India

Abstract
In this research, asymmetric single phase impedance source (Z-source) cascading Multilevel Inverter, Nine level inverter configuration with a unequal DC sources are presented. The optional configuration is extended by asymmetric single phase impedance source (Z-source) cascading multilevel inverter with unequal DC sources. These papers recommend variable frequency pulse with modulation scheme as a switching method. In this variable frequency PWM, stepped modulating system is used as variable frequency pulse width modulation. This topology concession decreased harmonics content present in the ac output voltage and better root mean square (RMS) value of the ac output voltages related with the stepped pulse width modulation. The simulation model of recommended configuration is carry out by using MATLAB/SIMULINK. © 2019, Institute of Advanced Scientific Research, Inc.. All rights reserved.

Abstract
Introduction: Migraine is characterized by headache due to imbalance between excitation and inhibition of neurons disabling normal day-to-day activities. The excitations of neurons are done by excitatory neurotransmitter glutamate which plays a key role in creating any pathology related to neurons. Materials and Methods: This study was done to identify GluR1 a subunit of α-amino-3-hydroxy-5-methyl-4-isoxazolepropionic acid (AMPA) glutamate receptor in the cells of trigeminal ganglion after inducing migraine and compare it with control rats. Results and Discussion: The GluR1 subunits were localized in the cytoplasm of neurons and these subunits were upregulated following migraine. The GluR1 was also localized in satellite glial cells and nerve fibers indicating these subunits expressed in neurons and migrate during nociceptive sensitization. This GluR1 expression in the cells of trigeminal ganglion may be crucial in nociceptive sensitization, leading to migraine and other painful conditions like trigeminal neuralgia. Conclusions: This study concludes that the GluR1of AMPA receptors are up-regulated following migraine which are involved in crucial mechanism inducing migraine. © 2019 JPR Solutions. Abstract
The use of herbal medicine for the control of oral/dental diseases and daily care has been practiced since ancient times. Now the new breakthrough is the development of herbal medicine-incorporated nanoparticle formulations in dentistry, as the plant-mediated biogenic metal nanoparticles can overcome the drawbacks of herbal drugs. Green synthesis of metal nanoparticles like silver, copper, and gold nanoparticles facilitated by various medicinal plant extracts has been found to be successful in the treatment of many oral/dental diseases, in fact it is more effective than conventional materials. These are also used in daily dental care products, like toothpaste and mouthwash. Yet, the knowledge regarding the safety of nanomaterials is insufficient, which compels more research. Nanoparticles incorporated with a combination of various plant extracts would address many issues, including drug resistance. © 2019 Elsevier Inc. All rights reserved.

Abstract
This work reports the potential of novel non-edible seed oil of Lepidium perfoliatum Linn. (LSO) for accessing its potential to synthesize biodiesel using zirconium-modified montmorillonite clay catalyst. The newly synthesized zirconium-modified clay catalyst (ZrO-Mmt) was characterized using by X-ray Powder Diffraction (XRD), Scanning Electron Microscopy (SEM), Energy-dispersive X-ray Spectroscopy (EDX), and Fourier transfer Infrared spectroscopy (FT-IR) spectroscopy. Response surface methodology (RSM) was used to optimize the Lepidium biodiesel (LBD) yield. Maximum biodiesel yield (88%) achieved under optimized reaction conditions were 1:15 oil: methanol, 3.5% catalyst amount at135°C for 4h respectively. Different techniques like FTIR, GC/MS, 1H-NMR, and 13C-NMR were used for characterizing LBD. Additionally, major fuel properties of LBD for instance kinematic viscosity (4.10 mm2/s), density (0.8212kg/L), cloud point (−8 °C), flash point (74°C), and pour point (−9°C) agree well with the international biodiesel standards. Overall, Lepidium perfoliatum Linn. seed oil and ZrO-Mmt clay catalysts appear to be cheap, stable, and highly active contenders for the biodiesel industry. © 2019, © 2019 Taylor & Francis Group, LLC.

Author Keywords
biodiesel; Lepidium perfoliatumLinn; montmorillonite; non-edible; transesterification

Index Keywords
Biodiesel, Clay minerals, Driers (materials), Energy dispersive spectroscopy, Fourier transform infrared spectroscopy, Oils and fats, Scanning electron microscopy, Transesterification, X ray powder diffraction, Zirconium; Biodiesel industry, Energy dispersive X ray spectroscopy, Fourier transfers, Lepidium perfoliatumLinn, Modified montmorillonite, non-edible, Optimized reaction conditions, Response surface methodology; Catalysts

Abstract
Objective: The objective of the present study is to evaluate the effect of Withaferin A (WA) on aging induced inflammation in the dopaminergic system of the rat brain. Materials and Methods: Wistar albino rats were divided into Group I - young (3 months), Group II - aged (24 months), Group III - aged rat supplemented with WA (50 mg/kg body weight [b. w.] once in a day for 30 days), and Group IV - young rat supplemented with WA (50 mg/kg b. w). Results: The estimation of nitrate and nitrite (NOx) levels revealed significantly increased levels in the aged animal when compared to young. The estimation of superoxide (O2-) showed significantly increased in the midbrain and striatum of aged rat when compared to young. The estimation of pro- and antiinflammatory cytokines presented significantly increased levels in aged midbrain and striatum when compared to young. The apoptotic study also revealed increased apoptotic nuclear morphology in substantia nigra and striatum of aged rat when compared to young. Interestingly, the WA administration significantly reversed the NOx, O2- levels. Conclusion: The present data clearly demonstrate that the WA potentially repress the aging mediated oxidative stress and inflammation in the dopaminergic neuron, thereby it prevents aging induced neurodegeneration of dopaminergic neurons. © 2019 Deuton-X Ltd. Abstract
Background: The oxidative stress plays a crucial role in aging mediated patho-biology of neuro-degeneration and its associated behavioral impairment. The purpose of this study is to evaluate the efficacy of Withaferin-A (WA) on aging induced oxidative stress in striatum (ST) and substantia nigra (SN) of aged rat brain. Materials and Methods: Animals were randomly separated into group I - young (3 months), group II - aged (24 months), group III - aged rat supplemented with WA (50mg/kg b.w once in a day for 30 days), and group IV - young rat supplemented with WA (50mg/kg b.w). After 30 days, through cervical dislocation, animals were sacrificed and the striatum and substantia nigra (mid brain) were dissected out from brain. Brain tissues were subjected to the estimation of enzymic antioxidants, levels of free radical production and apoptotic analyses (active caspase-3 and DAPI staining). Results: The data demonstrated reduced motor activity ($p<0.001$), increased Reactive oxygen species (ROS) ($p<0.001$), reduced enzymic antioxidant defense system ($p<0.001$), increased active caspase-3 activity ($p<0.001$) and increased apoptotic nuclear morphology ($p<0.001$) in aged ST and SN compared to young, which was significantly reversed by the supplementation of WA. Conclusion: The evidence from the present data emphasizes that WA bears beneficial property in the protection of striatal and nigral neuron from aging mediated oxidative stress and its associated apoptosis. © 2019 Deuton-X Ltd. Abstract
Introduction: The present work deals with the gas chromatography–mass spectrometry (GC-MS) analysis of Kutajarishtam which is used in the treatment of diarrhea, dysentery, irritable bowel syndrome, Crohn's disease, hemorrhoids, etc. Materials and Methods: Kutajarishtam was bought from a standard Ayurvedic vendor at Chennai and subjected to GC-MS analysis by standard procedures. The medicinal roles of the biomolecules indicated in the GC-MS profile were screened for their various medicinal roles using Dr. Duke's Phytochemical and ethnobotanical data and other data. Results: GC-MS profile of Kutajarishtam indicated the presence of important biomolecules such aso-Acetyl-L-serine, 4H-Pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl-, 2-Furanethanol.,beta.-ethoxy-, Acetic acid, 1-(2-hydroxy-1-methyl-ethyl)-3-methoxymethoxy-2-methyl-propyl ester and Cyclohexan-1,4,5-triol-3-one-1-carboxylic acid which have medicinal roles which correlated well with that of Kutajarishtam. Conclusions: It is concluded that Kutajarishtam, which is an important Ayurvedic medicine, contains some very important molecules showing its efficacy. Further research is required for a better understanding of the medicinal roles of this medicine. © 2019 JPR Solutions. All rights reserved.

Abstract
Introduction: The present study deals with the gas chromatography–mass spectrometry (GC–MS) analysis of an Ayurvedic oil Triphaladi Thailam, which is used to treat spilt hair, headache, sinusitis, and rhinitis and also for diseases related to neck, eyes, ear, and throat and to understand the molecular roles of this medicine. Methods: Triphaladi Thailam was bought from a standard Ayurvedic vendor at Chennai and subjected to GC–MS analysis by standard procedures. The medicinal roles of the biomolecules indicated in the GC–MS profile were screened for their various medicinal roles using Dr. Duke's phytochemical and ethnobotanical data and other data. Results: GC–MS profile of the Triphala Rasayana indicated the presence of important biomolecules such as 2-[4-methyl-6-(2,6,6-trimethylcyclohex-1-enyl)hexa-1,3,5-, á-Sitosterol, 1-Monolinoleoylglycerol trimethylsilyl ether, 1H-2,8a-Methanocyclopenta[a]cyclopropa[e]cyclodecen-11-one, and oleic acid. Conclusions: It is concluded that Triphala, which an age-old multipurpose folklore medicine does have a scientific efficacy. Further research is required for a better understanding of the medicinal roles of Triphaladi Thailam. © 2019 JPR Solutions. All rights reserved.

Abstract
Aim: The aqueous extract of Hypnea musciformis (red algae) was evaluated for hepatoprotective activity against aflatoxin-induced hepatotoxicity in male albino rats. Materials and Methods: The liver enzyme markers such as serum glutamic-oxaloacetate transaminase, serum glutamic-pyruvate transaminase, alkaline phosphatase and non-enzymatic marker Glutathione were assessed. Further the biochemical parameters such as urea, creatinine, albumin, total bilirubin and histopathology of control and treated were evaluated for the liver protecting activity of Hypnea musciformis against aflatoxin-induced liver damage. Results: Acute toxicity studies revealed that the LD50 value is more than the dose of 5 g/kg body weight. There is an increase in liver parameters such as SGOT (423.54 ± 5.31 U/L), SGPT (590.72 ± 6.20 U/L), ALP (428.16 ± 4.12 mU/L) and total bilirubin (4.33 ± 0.28 μmol/L). The elevated levels of liver enzymes and glutathione were significantly brought down to near normal values in Hypnea musciformis with aflatoxin treated groups. Conclusion: The aflatoxin-induced cellular damage was reduced and rejuvenated through the enzymatic and biochemical parameters by Hypnea musciformis extract. This mechanism was due to the presence of active biometabolites such as polyphenols and flavonoids in the red algal extract may interfere with the free radical formation which may conclude to hepatoprotective efficacy. © 2019 JPR Solutions. Abstract
Introduction: This study aims to know the types of biomolecules present in Eladi Kera Thailam and to correlate their possible medicinal roles supporting Eladi Kera Thailam's role as medicine. Methods: Eladi Kera Thailam was bought from a standard Ayurvedic vendor at Chennai and subjected to gas chromatography/mass spectrometry (GC/MS) analysis by standard procedures. The medicinal roles of the biomolecules indicated in the GC/MS profile were screened for their various medicinal roles using Dr. Duke's phytochemical and ethnobotanical data and other data. Results: The presence of some important biomolecules such as dodecanoic acid, 2,3-dihydroxypropyl ester, dodecanoic acid, 2-hydroxy-1-(hydroxymethyl) ethyl ester, octadecanoic acid, 2,3-dihydroxypropyl ester, and dodecanoic acid, 1,2,3-propanetriyl ester does have medicinal roles which contribute to Eladi Kera Thailam as a medicine for skin ailments. Conclusions: The GC/MS profile indicated the presence of some important biomolecules which have medicinal properties contributing to the role of Eladi Kera Thailam as a skin cure medicine. The study is a step in the direction of understanding the molecular mechanism of contemporary and alternative medicines. © 2019 Journal of Global Pharma Technology. All rights reserved.

Abstract
Introduction: The present work deals with the gas chromatography-mass spectrometry (GC-MS) analysis of Ksheerabala Thailam which is an Ayurvedic oil used for the treatment of Vata disorders such as neuromuscular pains, sciatica, spondylitis, paralysis, myalgia, for nerve regeneration, cataract, earache, and headache. Materials and Methods: Ksheerabala Thailam was bought from a standard Ayurvedic vendor at Chennai and subjected to GC-MS analysis by standard procedures. The medicinal roles of the biomolecules indicated in the GC-MS profile were screened for their various medicinal roles using Dr. Duke's phytochemical and ethnobotanical data and other data. Results: GC-MS profile of the Ksheerabala Thailam indicated the presence of important biomolecules such as n-Hexadecanoic acid, 15-Hydroxypentadecanoic acid, Hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester, (3-Fluorophenyl)carbamic acid, 2-isopropyl-5-methylphenyl ester, Hexadecanoic acid, 1-(hydroxymethyl)-1,2-ethanediyl ester, Hexadecanoic acid, 2-(octadecyloxy)ethyl ester,.gamma.-Tocopherol, and .gamma.-Sitosterol; these molecules do have medicinal roles which relate to that of Ksheerabala Thailam. Conclusions: It is concluded that Ksheerabala Thailam, which is an important Ayurvedic medicine, does contain some very important molecules showing its efficacy. Further research is required for a better understanding of the medicinal roles of Ksheerabala Thailam. © 2019 JPR Solutions. All rights reserved.

Abstract
Objective: Anuthailam, an Ayurvedic oil used for the treatment of diseases related to the brain, nose, sinus, eyes, head, neck, shoulders, and arms. Anuthailam is subjected to Gas chromatography–mass spectrometry (GC-MS) analysis to understand the molecules present therein. Materials and Methods: Anuthailam was bought from a standard Ayurvedic vendor at Chennai and subjected to GC-MS analysis by the standard procedures. The medicinal roles of the biomolecules indicated in the GC-MS profile were screened for their various medicinal roles using Dr. Duke's Phytochemical and ethno-botanical data and other data. Results: GC-MS profile of the Anuthailam indicated the presence of important biomolecules such as 15-Hydroxypentadecanoic acid, hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester, trans-13-Octadecenoic acid, 9-Octadecenoic acid (Z)-, 2-hydroxy-1-(hydroxymethyl)ethyl ester, 1-Heptatriacotanol.,gamma.-Tocopherol, (3-Fluorophenyl)carbamic acid, 2-isopropyl-5-methylphenyl ester, Stigmasterol, Hexadecanoic acid, 1-(hydroxymethyl)-1,2-ethanediyl ester, etc. Conclusions: It is concluded that Anuthailam, does have a scientific efficacy toward its claimed role as a medicine in Ayurveda. Further research is required for a better understanding of the medicinal roles of Anuthailam. © 2019 Journal of Global Pharma Technology. All rights reserved.

Abstract
Introduction: The present work deals with the gas chromatography (GC)-mass spectrometry (MS) analysis of Drakshadi Kashayam, which is used in the treatment of Panduroga (anemia), jaundice, and diseases caused due to imbalance in Pitta (bile) consistency. Methods: Drakshadi Kashayam was bought from a standard Ayurvedic vendor at Chennai and subjected to GC-MS analysis by standard procedures. The medicinal roles of the biomolecules indicated in the GC-MS profile were screened for their various medicinal roles using Dr. Duke's phytochemical and ethnobotanical data and other data. Results: GC-MS profile of Drakshadi Kashayam indicated the presence of important biomolecules such as carbonic acid, pentyl phenyl ester, bisphenol C, histamine, N-benzoyl-2-cyano-, o-Methoxy-.alpha.-phenethylamine, benzenethanamine, 3,4-dimethoxy-.alpha.-methyl-, cis-Z-.alpha.-Bisabolene epoxide, and 1,3-Dimethoxy-5-(1-methyl-heptyl)-benzene which have medicinal roles supporting the efficacy of Drakshadi Kashayam as a liver tonic. Conclusions: It is concluded that Drakshadi Kashayam, which is an important Ayurvedic medicine, does contain some very important molecules showing its efficacy. Further research is required for a better understanding of the medicinal roles of this medicine. © 2019 JPR Solutions. All rights reserved.

Abstract
Power Amplifiers are inherent part of a transmitting chain which required boosting the signal to overcome channel losses between transmitter and receiver. Power amplifiers are the prime consumers of the power in a transmitter hence during design stage designers need to look for the efficiency which is the figure of merit to know how efficiently DC power can be converted to RF power which is known as PAE (Power Added Efficiency). Also notice that efficiency translates either into lower operation costs e.g. Cellular Base Station or longer battery life e.g. Wireless handheld device such as Mobile Phone. Power Amplifier linearity is another important aspect of PA design so as to preserve the input and output power relationship to maintain the signal integrity. The design of PA often requires trade-off between linearity and efficiency. © 2019, Institute of Advanced Scientific Research, Inc.. All rights reserved.

Adverse drug reactions of cardiovascular drugs in intensive cardiac care unit in a tertiary care hospital: A prospective study

(2019) *Biomedical and Pharmacology Journal*, 12 (3), pp. 1079-1083. Cited 2 times.

DOI: 10.13005/bpj/1737

Abstract
Cardiovascular diseases are prevalent in developing countries like India. Patients with cardiovascular diseases are prescribed multiple drugs, hence polypharmacy may attribute to higher incidence of adverse drug reactions in these patients. To monitor and to analyze the pattern of occurrence of adverse drug reactions reported with cardiovascular drugs in intensive cardiac care unit of a tertiary care hospital, Chennai. This was a prospective surveillance study carried out for a period of 6 months. Analysis of various adverse drug reactions reported were done using various assessment scales. Descriptive statistics was used and values were expressed in numbers and percentage. During the study period, 282 adverse reactions were reported from 389 patients that includes 232 males and 157 females. The average age of the patients included in this study was 58.1± 16.8 years. The most common ADRs observed were electrolyte imbalance (14.89%), headache (13.12%) and gastritis (12.41%). Assessment using WHO Causality assessment scale revealed 60.28% were possible, 18.43% probable, 12.76% certain and 8.51% unlikely. According to Schumock and Thornton scale 65.9% of ADRs were preventable and 34% non preventable. Analysis with Hartwig and Seigel's scale 62.05% of ADRs were moderate in severity, 27.95% mild and 10.99% severe. Drugs attributing to highest ADRs were Digoxin and Furosemide. The common ADRs due to cardiovascular drugs can be reduced by improving the prescription pattern. Intense monitoring and reporting of ADRs could help in minimizing the preventable ADRs, among the health care professionals. © 2019 Oriental Scientific Publishing Company. All rights reserved.

Abstract
In the current study, Ni0.4Cu0.2Zn0.4LaxYxFe2-xO4 (x = 0.00 - 0.10) nanospinel ferrites (NSFs) were fabricated via an ultrasonic irradiation route. The creation of single phase of spinel nanoferrites (NSFs) was investigated by X-ray powder diffractometry (XRD) and selected area diffraction pattern (SAED). The cubic morphology of all samples was confirmed by scanning and transmission electron microscopies (SEM and TEM) respectively. The UV-Vis investigations provided the direct optical energy band gap values in a narrow photon energy interval of 1.87-1.92 eV. The 57Fe Mössbauer spectroscopy analysis explained that the hyperfine magnetic fields of Octahedral (Oh) and Tetrahedral (Td) sites decreased with substitution. The paramagnetic properties of NPs decrease with increase of content of doped ions. Investigations of magnetic properties reveal a superparamagnetic nature at 300 K and soft ferromagnetic trait at 10 K. The Ms (saturation magnetization) and Mr (remanence) decrease and the Hc (coercivity) increases slightly with La3+ and Y3+ substitution. The observed magnetic traits are deeply discussed in relation with the morphology, structure, magnetic moments and cation distributions. The microwave characterization of the prepared NSFs showed that, dissipation (i.e., absorption) of incoming microwave energy occurs at a single frequency, for each sample, lying between 7 and 10.5 GHz. The reflection losses (RL) at these frequencies range from -30 to -40 dB and the mechanism of which is explained in the framework of dipolar relaxation and spin rotation. The best microwave properties were obtained with a LaY concentration of x = 0.08 having an RL of -40 dB @ 10.5 GHz and an absorption bandwidth of 8.4 GHz @ -10 dB. With these high values of RL and absorbing bandwidth, LaY doped NiCuZn NSF products would be promising candidates for radar absorbing materials in the X-band. © The Royal Society of Chemistry 2019.

Abstract
Cervical cancer is a life threatening disease contracting women population in great numbers. It is the fifth most common cancer having high impact on human mortality. The second most common cancer prevalent among women worldwide is cervical cancer. Cervical cancer is due to sexually transmitted virus known as human papillomavirus (HPV). In this paper a mathematical model and ontological representation of this model HPVMath ontology has been formulated to expose the viability of HPV which leads to cervical cancer in women. Mathematical models translate data in to trials which gives deep insights about women population: not suspected for HPV, suspected for HPV, with HPV without cervical cancer, with HPV with cervical cancer. These trials from short-term findings can lead to long-term health outcomes. In addition HPVMath ontology representation formalises a common view for HPV prevalence which can in turn assist medical practitioners and generate awareness among common men. This paper explores and defines the circumstances of HPV in to an ethical focus in an age characterisation by the worldwide environmental threats. © 2019 Inderscience Enterprises Ltd.

Abstract
Nanotechnology or nanoscience refers to a field of applied science whose theme is the control of matter on an atomic or molecular scale. In general, nanotechnology deals with structures 100 nm or smaller and involves developing materials or devices within that size. Nanotechnology entered dentistry with the advancements in diagnostics, material sciences (mainly composites and bonding agents), preventive dentistry, and dental surgical procedures. A new standard innovation in endodontics is the use of nanobrush for cleaning the root canals along with irrigating solutions. This article is a review that highlights the significance of nanobrush in dentistry. © 2019 JPR Solutions. All rights reserved.

Abstract
Background: Uncontrolled alcohol consumption is a global health-care problem accounting for 3 million deaths in 2018. Chronic alcohol intake causes damage nearly every organ in the body. Argyreia nervosa belongs to the family Convolvulaceae is also known as elephant creeper or woolly morning glory. Conventionally, the plant has been used medicinally for its broad range of clinical effects such as antiviral, antibacterial, antifungal, and anti-inflammatory properties. Aim: The present study was designed to evaluate the possible effect of A. nervosa on liver function markers of alcohol-induced liver in male albino rats. Materials and Methods: A. nervosa leaf extract oral doses (100 and 300 mg/kg body weight) were given once in a day for 8 weeks to ethanol-induced rats. At the end of the experimental period, blood was collected sera from control and experimental animals. Liver function markers and lipid were assessed. Results: Ethanol-induced rats showed a significant increase in the serum levels (aspartate aminotransferase, alanine aminotransferase, alkaline phosphatase, and gamma-glutamyl transferase) when compared with control animals. Serum lipid markers such as triglycerides, total cholesterol, low-density lipoprotein cholesterol (LDL-C), and very LDL-C were also found to be significantly increased in ethanol-induced rats. Conversely, serum high-density lipoprotein cholesterol was decreased in ethanol and sucrose-fed rats. Treatment with A. nervosa leaf extract normalized the altered levels of liver function markers and lipid parameters. The 300 mg dose of A. nervosa showed the maximum protective effect compared to 100 mg dose. Conclusion: Our data indicate the hepatotoxicity induced by chronic alcohol exposure and shows the ability of A. nervosa extract (100 and 300 mg/kg of body weight) to eliminate this toxicity. Hence, A. nervosa may be used as one of the potential medicinal plants for the protection of the liver from alcohol-induced toxicity. © 2019 JPR Solutions. All rights reserved.

Author Keywords
Argyreia nervosa; Ethanol toxicity; Lipid profile; Liver function markers; Sucrose

Index Keywords
Agyreia nervosa extract, alanine aminotransferase, alcohol, alkaline phosphatase, aspartate aminotransferase, gamma glutamyltransferase, high density lipoprotein cholesterol, low density lipoprotein cholesterol, plant extract, sucrose, triacylglycerol, unclassified drug, very low density lipoprotein; Agyreia nervosa, alanine aminotransferase blood level, albino rat, alcohol intoxication, alcohol liver disease, alkaline phosphatase blood level, animal experiment, animal model, Article, aspartate aminotransferase blood level, blood sampling, cholesterol blood level, controlled study, Convolvulaceae, drug dose comparison, gamma glutamyl transferase blood level, liver function, liver protection, liver toxicity, male, nonhuman, plant leaf, rat, treatment duration, triacylglycerol blood level

Chemicals/CAS
alanine aminotransferase, 9000-86-6, 9014-30-6; alcohol, 64-17-5; alkaline phosphatase, 9001-78-9; aspartate aminotransferase, 9000-97-9; gamma glutamyltransferase, 85876-02-4; sucrose, 122880-25-5, 57-50-1

An adaptive low power coding scheme for the NoC

(2019) *International Journal of Advanced Intelligence Paradigms*, 13 (3-4), pp. 324-333.

DOI: 10.1504/IJAIP.2019.101982

[b] School of Electronics, VIT, Chennai Campus, Tamil Nadu, India

Abstract
Low power system design is important for system-on-chip design where communication takes place at higher data rate to realise the system functionality. Low power coding reduces energy by reducing self-switching activity or coupling switching activity. But under typical network-on-chip (NOC) system, we require a low power coding scheme to handle different kinds of data traffic from different IP core at different instant and different places in system-on-chip (SOC). As single low power coding scheme will not solve all application demands, a correlation analysis based adaptive data coding scheme is presented. Based on the classification of data traffic as low, moderate and highly correlated, different coding scheme is applied. The proposed system is simulated in labVIEW FPGA tool for the USRP RIO target. Based on comparative analysis of power consumption between the existing coding schemes and proposed adaptive scheme 25% energy saving is achieved at the worst case scenario. © 2019 Inderscience Publishers. Cariogenic potential of commercially available date syrup as a sweetening agent in milk – An in vitro study
(2019) *Drug Invention Today*, 12 (8), pp. 1794-1798.

[a] Department of Pedodontics, Bharath Institute of Higher Education and Research, Sree Balaji Dental College, Chennai, Tamil Nadu 600 100, India

Abstract
Background: Early childhood caries is a condition with multifactorial etiology, of which frequent nighttime use of bottle containing milk sweetened with sucrose plays a significant role. In the quest for finding an alternative low cariogenic sweetening agent to sucrose, date syrup was studied. Aim: The study aimed to determine the cariogenic potential of commercially available date syrup in combination with milk and to compare it with milk sweetened with sucrose. Materials and Methods: Analysis of viscosity and constituent sugars of the test substances were performed using viscosimeter and high-performance liquid chromatography (HPLC), respectively. The effect of the test substances on the growth of Streptococcus mutans was carried out using ditch plate method (zone of inhibition/exhibition). Results: Date syrup showed the highest viscosity, but in combination with milk, it was not statistically different from milk sweetened with 10% sucrose. Analysis of sugars by HPLC revealed the presence of sucrose (1.039% w/w), glucose (3.365% w/w), fructose (4.033% w/w), lactose (0.466% w/w), and a polyol (sorbitol – 8.045% w/w) in date syrup. When combined with milk, the concentration of fructose and sorbitol decreased significantly. Date syrup showed a zone of inhibition (20.72 mm) when tested using ditch plate method. However, in combination with milk, no inhibitory action was present. Conclusion: Based on these results, it was concluded that there was no significant difference in the viscosity and effect on growth of S. mutans between milk sweetened with date syrup and 10% sucrose. However, the inhibitory action of date syrup against S. mutans when used alone is a novel one and warrants more research. © 2018 Termedia Publishing House Ltd.. All rights reserved.

Abstract
The prime issue in supersonic combustion is proper mixing within short duration of time. Computational study has been performed to analyse the mixing of air and fuel using cross flow injection technique. Cross flow injection is performed by placing the fuel injectors on the walls of the scramjet engine which is perpendicular to the flow. To enhance the mixing of fuel and air, cavities were introduced. The flow recirculation inside the cavity will enhance the mixing and combustion. The fuel injectors were placed just upstream of the cavity. Analyses were done by changing the injection angles. The air is allowed to enter at different Mach numbers and the changes were analysed using ANSYS software. The roles of cavity cross flow injection, pressure, temperature, velocity and Mach number variation were examined in this study and the obtained results were compared between various configurations. © 2019. Abstract
Asparagus racemosus (A. racemosus) commonly known as Shatavari or satavar belongs to family of Liliaceae. It is grown in tropical areas of India, Sri Lanka and Himalayas. Shatavari crop generally shows resistance to pest and insects and unaffected with diseases. The crop grows well in tropical and hot climate. Well drained fertile black soil is most preferred for the cultivation of crop. The dried root extracts of the plant are used as drug. The root extracts are proved for to possess pharmacological efficacies such as antioxidant potential, antimicrobial property, anti-tumor potential, hepatoprotective role and antidiabetic activity. The present article explores the therapeutic properties of A. racemosus root which are reported so far. © 2019 EManuscript Technologies. All rights reserved.

Abstract
Background: Asparagus racemosus is a climber shrub used in Indian medicine for centuries. It has been used as galactogogue and nerve tonic in folk medicine. The recent research on A. racemosus has revealed its disease fighting properties such as anti-bacterial, immunomodulatory, cardio protective, anti-stress, etc. Phytochemicals present in the plants are associated with their therapeutic capabilities. Hence, phytochemical screening of a therapeutic plant is essential. Materials and Methods: A preliminary qualitative screening of phytoconstituents present in the ethanol and aqueous extract of the plant was done. high-performance thin layer chromatography (HPTLC) was used to create a phytochemical fingerprint of the plant extract. Further, a series of antioxidant assays, i.e., 2,2-diphenyl-1-picrylhydrazyl (DDPH) radical, Nitric oxide (NO) radical, Superoxide (SO) radical and 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulphonic acid) (ABTS) radical scavenging assays were done. Results: The phytochemical screening and the HPTLC fingerprint showed the presence of phenolic compounds, flavonoids, glycosides, triterpenoids, saponins etc. They also showed free radical scavenging property and hence can be used as potential primary antioxidant. Conclusion: A preliminary screening created a phytochemical profile of A. racemosus extracts. These phytoconstituents may be linked to the various known therapeutic applications of the plant. This may aid in further extensive studies for identifying and isolating compounds with potential therapeutic value in A. racemosus. © 2019 Phcogj.

Abstract
The knowledge of the types of biomolecules present in Ayurvedic medicines can help in understanding the underlying mechanism of action of such medicines. This type of study is very pertinent and being sought after in the present day medical scenario, which needs newer and better approaches of treatment. The present study deals with the GC MS analysis of one such Ayurvedic medicine, Amritarishtam, which is used for the treatment of all types of fevers. The medicines was procured from standard Ayurvedic vendor at Chennai and subjected to GC MS analysis after following proper procedures. The GC MS profile indicated the presence of 12 biomolecules, such as, Phenylethyl Alcohol, Ethyl Hydrogen Succinate, 5-Hydroxymethylfurfural, Thymol, Ethanone,1-(2-hydroxy-4-methoxyphenyl)-, Hexadecanoic acid,2-hydroxy-1-(hydroxymethyl)ethyl ester and Ocatadecanoic acid,2,3-dihyroxypropyl ester which have medicinal values relating to that of Amritarishtam. Further work to isolate the molecules and understand their role is in process. © RJPT All right reserved.

Abstract
Context: Infections caused by funguses are increasing at a steady rate worldwide. Elderly individuals and who are at an immunocompromised state are at risk of developing this disease. Though fungal infections which either manifest as cutaneous or invasive type, Cutaneous lesions are very common. Fungal diseases are diagnosed usually by correlating the clinical findings with histopathology and confirmation is done based on culture. Aim: The current study was aimed at categorizing the spectrum of fungal infections diagnosed in the histopathology specimens and their distribution according to age, sex and site of involvement. Settings and Design: This was a cross sectional analysis, conducted over a period of one year from September 2016 to August 2017. Methods and Material: A total of 60 cases were enrolled in the study. Clinical findings inclusive of age and sex parameters were noted from hospital registrars. Specimens were fixed in formalin and processed under standard procedure protocols. Slides were prepared and stained with routine H & E stain; special stains like PAS and GMS stains were used wherever necessary. Statistical analysis used: Data analysis was using IBM Statistical Package for the Social Sciences Software version 21. Significance of the statistical tests at P value less than 0.05 was based on 95% confidence interval. Results: Out of 60 cases, 18 cases turned out to be positive for fungal infection. The mean age of the studied population was 49.11 years (SD 11.02). The male female ratio was found to be 0.8:1. The mean age of male population was found to be 53.375 years (SD 7.44), mean age of female population was 45.7 years (SD 12.54). The commonest fungal infection encountered in our study was Rhinosporidiosis. Conclusions: Histopathological examination provides reliable diagnosis in individuals with uncertain clinical findings of fungal infection. © Red Flower Publication Pvt. Ltd.

Abstract
Currently, Investment is the crucial section of our country financial system. The forecasting of price indicator is very necessary for stockholders to earn the maximum profit from their investment. The stocks vary by some factors likely financially, political and public. By using typical strategies for stock market forecast lead to precise results. As, the intellectual techniques have this ability that consider the complicated effects of the factors within the analysis, thus we came to use them in stock key prediction. Hence, use of genetic algorithm for predicting and optimizing the input variable in the neural network. Some models be assigned for this predictions as ARIMA as Hybrid by Artificial Neural Networks as approaching Genetic Algorithm. © 2019, Institute of Advanced Scientific Research, Inc.. Computational prediction of binding of monocrotophos and its analogues on human acetylcholinesterase, oxyhaemoglobin and IgE antibody

(2019) *International Journal of Computational Biology and Drug Design*, 12 (3), pp. 268-280.

DOI: 10.1504/IJCBDD.2019.101065

[a] Centre of Excellence in Patterned Multiferroics and Nanotechnology, Bharath University, Selaiyur, Chennai, 600 073, India

Abstract
In this study, a computational approach has been employed to study the interactions of human acetylcholinesterase (AChE), human oxyhaemoglobin and human high-affinity IgE receptor with an organophosphate pesticide, and the comparative binding affinity, interacting residues of protein, H-bond distance and fitness score have been evaluated using GOLD software. Monocrotophos and its analogues bind to AChE with the highest fitness score. The analogue RPR-II binds to the receptor with a highest fitness score: 42.17 when compared with RPR-V (fitness score: 40.62) and monocrotophos (fitness score: 35.25). Monocrotophos, RPR-II and RPR-V interact with oxyhaemoglobin with a fitness score of about 17.68, 20.16 and 24.62, respectively. Monocrotophos, RPR-II and RPR-V interact with human high-affinity IgE receptor with a fitness score of about 18.29, 19.05 and 22.57, respectively. The above-mentioned results indicate that RPR series are highly toxic than monocrotophos, hence there is a need for complete evaluation of the toxicological effect of new pesticides. Abstract

Costus igneus popularly known as 'Insulin plant' belongs to Costaceae family. The anti diabetic potential of the plant has been evaluated and widely used as Ayurvedic medicinal herb to treat diabetes mellitus and associated metabolic syndrome. Recently Non- alcoholic fatty liver disease (NAFLD) associated metabolic syndrome has been identified as an important risk factor for hepatocellular carcinoma (HCC).So agents with insulin sensitizing action could play dual role in the control of metabolic syndrome and cancer. This study is designed to evaluate the in vitro anticancer activity of the ethanolic extract of Costus igneus leaves against hepatocellular carcinoma(HepG2) cells. The viable cells were assessed by cytotoxicity activity (MTT assay) with the eight different concentration (1000 to7.8 µg/ml) of the extracts. The percentage of viability was calculated. From the graph the concentration required for a 50% of viability (IC50) was calculated as 62.5 µg/ml. However 74.57% and 22.65% of cell viability were produced by the concentration of 7.8 µg/ml and 1000 µg/ml respectively. The results showed the cytotoxic activity of ethanolic extract of Costus igneus leaves and proved the anticancer activity against liver cancer cells. © 2019 Oriental Scientific Publishing Company. Design for reliability – Reliability prediction & correlation study using test results and field feedback
(2019) *International Journal of Mechanical and Production Engineering Research and Development*, 9 (3), art. no. IJMPERDJUN2019128, pp. 1209-1228.

DOI: 10.24247/ijmperdjun2019128

Abstract
In the competitive market, Quality and Reliability are playing a vital role. Reliability is a measure of quality, which is a key characteristic at each stage of the product starting from Design through Manufacturing, Assembly, Delivery & Usage in the field. Reliability is differentiated from quality by being particularly concerned with time [1]. Reliability gives the data about how long the product will work with specified quality. Reliability is defined as the probability that an item will perform a required function for a given period of time when used under stated operating conditions [1]. The reliability stresses on four elements namely [1]; Probability, Intended function, Time, and operating conditions. Reliability / Design life of the product could not be predicted accurately using Lab test failures unless it is correlated with Field conditions. This gap can potentially result in increased Cost of Poor Quality (COPQ) [2], increase in warranty returns & most importantly Customer dissatisfaction. On the other hand, over designing due to inaccurate reliability / Design life predicted results in the unnecessary increase in product cost, reducing the profit. The conventional way of product development is, designing & developing the product as per requirements & then validation of design by physical testing. The testing process involves, subjecting the samples to various test conditions like vibration test, corrosion test, etc., for pre-defined test duration as per national & international standards. If the sample passes all the required tests, then the product will be launched. A major drawback in this system is tested standards do not always reveal the field failures. Unless we know the correlation between test conditions & field conditions, field failures cannot be predicted or eliminated. This paper estimates the reliability of carburetor from its lab test and field failures. A warranty period of one year is accounted for the calculation of reliability. This means product reliability at the end of one year is predicted and the same is compared with the reliability calculated from warranty / field failures, to check if any Over design exists or opportunity exists to improve the reliability of the product. A two-wheeler carburetor is selected for this study & the methodology can be horizontally deployed to any product. © TJPRC Pvt. Ltd.

Frugal product development: Think beyond conventional product development approach to "ensure customer satisfaction, by familiarizing product and its performance"

(2019) *International Journal of Mechanical and Production Engineering Research and Development*, 9 (3), pp. 1057-1068.

DOI: 10.24247/ijmperdjun2019113

Abstract
Customer satisfaction is one of the key elements, to be successful in competitive business. The big challenge in front of every manufacturers, irrespective of Industry they are in is; how to satisfy customers. By and large customer satisfaction is mostly measured after the product or service is launched. Once we have customer feedbacks, its important to understand and categorize as Defects and Dissatisfactions. Ideally Defects shall be treated by improving the product, whereas Dissatisfaction items have to be treated carefully case-by-case. As in the case of Indian Automotive Industry, there are considerable amount of First time car buyers who might not be fully aware of Products' features. So its important that manufacturer deals it with specific care on how Product features are communicated to customers and how familiar are they with the same. This plays a vital role in deciding Customer satisfaction. Though many attempts have been made to capture customer voice during design phase and to consider in formation of specification through Quality Function Deployment, it mainly focuses on Defects only, not Dis-satisfaction which is purely driven by customer expectations. This paper attempts to understand and address Dissatisfaction items by Customer familiarization. A sample case of Passenger car Real world Fuel efficiency has been taken in to study and demonstrated that appropriate Customer familiarization brings sizeable results and improves customer satisfaction. © TJPRC Pvt. Abstract
Periodontal disease is one of the most prevalent oral diseases affecting the supporting tissues of the teeth, gingiva, periodontal ligament, cementum, and alveolar bone. Periodontal diseases are inflammatory disorders; oxidative stress (OxS) plays an important role in the pathogenesis of periodontitis, which can cause damage to genetic biomolecules such as proteins, lipids, and DNA. Increased OxS leads to oxidative damage of DNA with the formation of 8-hydroxydeoxyguanosine (8-OHdG) which is excreted in body fluids including gingival crevicular fluid (GCF) and saliva. 8-OHdG is used as a standard biomarker of oxidative DNA damage mainly due to its reliable detectability © 2019 JPR Solutions. Abstract
This present study aims in understanding the influence of dominant fatty acid esters of waste animal fat biodiesel on its emission characteristics in CI engine. Biodiesel was produced from waste animal fat by means of base catalysed transesterification; and Ethyl oleate (40.21%), ethyl palmitate (25.36%) and ethyl stearate (16.87%) were characterized as dominant fatty acid esters using GC spectra. Test samples were prepared for these ester molecules based on their availability, in addition to biodiesel blend and plain diesel and were tested for their emission levels in single cylinder four stroke CI engine using flue gas analyser. High exhaust gas temperature was contributed by Ethyl oleate (1.15% lesser than biodiesel), as a result of low cetane number due to unsaturation and high viscosity. Likewise, the increased carbon chain length and unsaturation of ethyl oleate (2.55% lesser than biodiesel) resulted in high concentration of CO emission for biodiesel whereas high CO2 emission concentration was because of ester molecules with increased carbon chain length (stearate and Oleate esters). Reduced NOX emission for biodiesel was as a result of higher cetane number from ethyl stearate (CN=86.83) and ethyl palmitate (CN=86.55), which reduced its ignition delay thereby moderating the heat release rate. In addition, long carbon chained ester molecules (oleate and stearate esters) in biodiesel consumed more oxygen content for improving overall rate of combustion while increased HC emission was explained by unsaturation in biodiesel because of ethyl oleate (on average, 50 PPM). © 2019 Srinivasan, Palani, Jambulingam and Shankar.

Comparative analysis of liver segmentation using K-means, fuzzy c-means and spatial FCM using mumford shah approach

(2019) *Journal of Advanced Research in Dynamical and Control Systems*, 11 (2), pp. 1592-1596.

[c] Dept. of Computer Applications, Bharath Institute of Higher Education and research, Selaiyur, Chennai, 73, India

Abstract
In medical environment,liver segmentation plays an important role by helping physicians to find the location of affected region of the liver from the normal part.Automatic extraction which is recognized as segmentation by computer processing may diminish the burden as well as time consuming. To overcome the burden of identification of definite organ segmentation technique is used. In general liver analysis have done through CT scan or MRI scan whereas the image of MRI scan is utilized for the complete process which is more convenient than other scanning while diagnosing. This does not create harmful to human body due to no practice of radiation. As the initial stage, image segmentation has been done through spatial fuzzy clustering which can control level of its parameter to set advancement as a result in the fuzzy clustering. In this advanced technique, mumford shah method is used to improve the robustness with less time consumption. This study has focused on both less time extraction and also the accuracy. So, in order to attain spatial fuzzy clustering is proposed and also compared with the existing clustering algorithm such as K-means, Fuzzy C-Mean (FCM) to evaluate the performance efficiency in time extraction using clustering outcomes. © 2019, Institute of Advanced Scientific Research, Inc.. Abstract
Finnair Systems is an all around centered Software Developed and IT Services Company situated in Chennai. We have committed groups of Professionals with assorted specialized ability sets to handle the difficulties in different zones of IT administration. Our principle center is around stringent quality models, outstanding asset abilities and a steady record of conveying quality answers for customers on calendar. Essentially Finnair Systems is a center Product Development Company fundamentally concentrate on Enterprises Applications Development and Web based Applications Development. Numerous Indian organizations including littler and greater scale ventures incline toward our advancement focus to take care of their issue as per their necessities. Our central goal is to advance programming use not just for multinational bodies additionally for our Indian little scale ventures with our limited time projects and occasions. Presently the time has arrived when all little scale businesses likewise need to utilize programming instead of manual framework. We need to give arrangements according to their prerequisites with no budgetary constraints."We vow to convey quality items and advance little scale enterprises for programming use that leads them to accomplish pinnacle." Finnair Systems offers world-class advances to its clients in the accompanying ranges: Enterprise Solutions (ESOL). Web Development Management (WDM). IT Management Consultancy (ITMC). Event Management (EMG). Technical Expertise. © 2019, Institute of Advanced Scientific Research, Inc.. All rights reserved.

A study on antioxidant activity, phenol, and flavonoid content of seedpod of Nelumbo nucifera Gaertn.
(2019) *Drug Invention Today*, 11 (4), pp. 835-840. Cited 8 times.

[a] Department of Physiology, Tagore Medical College and Hospitals (Research Scholar, PhD in Bharath University), TN Dr. MGR Medical University, Chennai, Tamil Nadu, India
[b] Department of Physiology, Tagore Medical College and Hospitals, TN Dr. MGR Medical University, Chennai, Tamil Nadu, India

Abstract
Objective: The objective of the present study was to evaluate the presence of phenol, flavonoid, tannin, antioxidant activity, and high-performance liquid chromatography (HPLC) analysis of quercetin (active component of Nelumbo nucifera [NN]) in ethanolic extract of the seedpod of Nelumbo nucifera (NNE). Materials and Methods: Preliminary screening of NNE was done for the presence of phenol, flavonoid, tannin, qualitatively, and quantitatively. Antioxidant activities of the NNE were estimated using extracts of aqueous, acetone, ethanol, and chloroform by in vitro antioxidant assays such as 1,1-diphenyl-2-picrylhydrazyl (DPPH) and ferric reducing antioxidant power (FRAP) assays. Results: Total phenolic content in NNE was 93.45 mg gallic acid equivalents, the total flavonoid content was 295.312 mg/g quercetin equivalents in NNE, and tannin content is 508.7 mg/g tannin equivalents in NNE. The NNE was evaluated for antioxidant activities by DPPH and FRAP assays. Among the different solvent, the ethanolic extract recorded the most effective DPPH radical scavenging activity (69.2%) and FRAP value was 21.52 μm. The results of HPLC analysis revealed the presence of active principle, namely quercetin. Conclusion: It can be concluded that NNE can be used as a potent natural antioxidant to overcome oxidative stress-induced diseases. © 2019 JPR Solutions. All rights reserved.

Author Keywords
1; 1-Diphenyl-2-picrylhydrazyl; Antioxidant activity; Ferric-reducing antioxidant power; Flavonoid; Nelumbo nucifera; Phenol

Abstract
Introduction: In Ayurveda, Asparagus racemosus is an amazing herb known as the “Queen of Herbs” because it promotes love and devotion. Shatavari is the main Ayurvedic rejuvenative tonic for the female, as is Withania for the male. This herb is highly effective in problems related with female reproductive system. A. racemosus is a well-known Ayurvedic rasayana which prevent aging, increase longevity, impart immunity, improve mental function, vigor, and add vitality to the body and it is also used in nervous disorders, dyspepsia, tumors, inflammation, neuropathy, and hepatopathy. The aim of the study was to evaluate the antimicrobial activity of Allium cepa against bacteria causing enteric infection. Materials and Methods: The screening of antibacterial activity of extracts was carried out using the disc diffusion method. The culture plates were allowed to stand on the working bench for 30 min for pre-diffusion and were then incubated in upright position at 37°C for 24 h. Standard antibiotic discs gentamycin (30 mcg/disc) were used as positive control. Results: The extracts at different concentrations exhibited antibacterial activity against the bacterial strains tested. The extract was more effective against Lactobacillus acidophilus with a zone of inhibition of 16 mm diameter (at conc. of 400 mg/ml) and with Streptococcus mutans, the zone of inhibition was found to be 15.8 mm (at conc. of 400 mg/ml). Conclusion: We conclude that the extracts of A. racemosus can be used as antimicrobial agent. © 2019 JPR Solutions. All rights reserved.

Abstract
Bandpass filter are of very high importance when considering features such as signal transmission and wireless communication. The use of Microstrip technology offers us a very compact realization of a microwave filter thereby reducing the filter size and output parameters. This project proposes a capacitor tuned microstrip coupled bandpass filter (BPF) loaded with parallel coupled microstrip line with capacitors connected in the middle in order to enhance tuning of the bandpass filter instead of free ends. This configuration enhances the tunability of the suggested BPF by varying the values of the capacitances inserted in the circuit, which leads to a wide tuning range even with a small capacitance values. Therefore, a wide tuning range can be obtained by employing low capacitance values with which a tunable bandpass filter can be achieved. As a result, the proposed tunable BPF can keep nearly constant bandwidth over the wide tuning range. Based on the requirement of the operating frequency the bandpass filter can be tuned for the particular frequency thereby enhancing the band selectivity character in the design. © 2019, Institute of Advanced Scientific Research, Inc. Abstract
Bandpass filter play a very vital role in the field of communication. With the advent of large number of communication the devices working a range of frequencies the use of Microstrip technology offers us a very compact realization of a microwave filter thereby reducing the filter size and output parameters. This work presents a tunable dual-band tunable bandpass filter (BPF) with dual band bandpass response with a novel tunable dual-mode character in the range of 1-15GHz and a single band bandpass filter in the range of 1-10GHz. The proposed dual band bandpass filter design primarily consists of tunable components such as varactor diodes and capacitances to bring about tunability in the filter design. The circuit designed is a Triple U-shaped circuit so as to obtain a compact filter structure which has varactor is placed at the center of the microstrip circuit and capacitances so as to produce a tunable bandpass filter response. This approach has enhanced the tunability of the proposed dual band filter by tuning the varactors and capacitances present in the circuit, thereby exhibiting a uniform tuning range with a minor changes in the values of the capacitor and varactor. Therefore, a uniform tuning is obtained by employing capacitance and varactor and the circuit can maintain nearly a constant bandwidth over the tuning range. The single band filter is designed to work in the range of 1-10GHz where the single band can be tuned between the entire operating frequencies. Simulated results are found to be more efficient. The S-Parameter [S (2, 1)] results for the dual band bandpass filter show that the first passband can be tuned in a frequency range from 2.4 to 4.45 GHz, whereas the second passband varies from 8.5 to 11 GHz. © 2019, Institute of Advanced Scientific Research, Inc.. Abstract
In this paper a class E 2 power converter is designed using class E power amplifier. The concept of combining the use of GaN HEMT devices, both for the inverter and the synchronous rectifier, with multi-harmonic matching networks has been utilized. The power amplifier is an inverter and the process of amplifier converts the DC to AC signal, the inverter designed by using the transistor of RF3931 and achieves the steps for testing the transistors range verified and the HSMS2862 rectifier used for high switching frequency and converts AC to DC signal and for high output voltage compare to inverter the rectifier achieves high output voltage to develop for very high frequency applications and the matching circuits developed to matches the inverter and rectifier. The resultant measurement of power converter achieves 60dBm output voltage. © 2019, Institute of Advanced Scientific Research, Inc.. All rights reserved.

Abstract
This article explains the working of proposed singular value attribution approach incorporating (EM)-Expectation-Maximization and (RDF)-Random Decision Forest techniques. It handles the absenting values efficaciously in diminutive data set so that, assigning priority for each parameter to foresee the disease in the early stage. As a result, anyone can take adequate preventive methods to control the development of the disease. To handle the voluminous database, multiple value imputation models are adopted. The proposed (WAELI)-Weighted Average Ensemble Learning Imputation algorithm can be used in predicting kidney disease with more accuracy. By using RDF, (CART)-Classification and Regression Tree and C4.5 algorithms the absenting valance in the dataset uniquely reckoned. Priority assigning algorithm is thereafter used to make the classification process, which very efficiently reduces the time consumption. © 2019, Institute of Advanced Scientific Research, Inc.. Real time RNA sequence edition with matrix insertion deletion for improved bio molecular computing using template match measure

(2019) *International Journal of Advanced Computer Science and Applications*, 10 (4), pp. 440-444.

Abstract
The RNA sequence editing has become a challenging task in the molecular computing. There are number of approaches that have been discussed earlier for the problem RNA editing in bio molecular computing, but they suffer to achieve higher performance. To improve the performance, an real time approach has been presented which uses sequence depth measure (SDM). The method receives the RNA sequence and estimates the depth measure for different sub sequences generated. Based on the SDM value, a cumulative sequence match measure (SMM) has been measured to classify the sequence towards the different classes available. The matrix insertion and deletion is performed based on the template match measure (TMM) which has been computed based on the matches found in the templates available for different classes. The experimental results of our approach prove to outperform in terms of Accuracy, Risk Detection Accuracy, Time Complexity and False Classification Ratio which in turn increases the performance of bio molecular computing and matrix insertion deletion. © 2018 The Science and Information (SAI) Organization Limited.

Regression analysis of coherence between concurrent EEG-EEG and EEG cppg signals from prefrontal cortex during music evoked emotions

(2019) *Journal of Information Science and Engineering*, 35 (3), pp. 577-595. Cited 1 time.

DOI: 10.6688/JISE.201905_35(3).0006

Abstract
This paper summarizes the results of experiment that focus on effect of music evoked emotions on mean squared coherence and phase coherence between two signals with same nature (electrical brain signal EEG) and the two signals with different nature (EEG and hemodynamic brain signal CPPG). Regression analysis was carried out to find out the mathematical relation between mean squared coherence and phase coherence estimated between the two signals captured from prefrontal cortex and the physiological parameters. Number of synaptic connections between the two measurement sites/ signals and its strength is reflected in the coherence. It is a quantitative measure of association between the two simultaneously acquired signals as a function of frequency. Physiological parameters studied by the authors are SBP, DBP, HR, Blood Glucose and BMI. These are some of the potential biological markers closely related to emotional response. Data was collected from twenty multi-lingual subjects of both the genders with Meanage = 39.25 years and SDage = 11.625 years. No strong correlation was found between the coherence (calculated between EEG-EEG and EEG-CPPG) and the physiological parameters studied during the various emotional states. It was observed that MS Coherence between the signals with similar nature is higher than it in between the signals with dissimilar nature. T-paired test was carried out to show that the means of these two coherences is different. Coherence between EEG-EEG was compared with coherence between EEG-CPPG and it was observed that they are very different ($p < 0.001$), were as when coherence between EEG-EEG (or EEG-CPPG) is compared with coherence between EEG-EEG (or EEG-CPPG) p-value was > 0.05. This technique can be applied to wider population in the field of clinical neuroscience with or without any known neurological disorder. More connectivity measures can also be included to study music evoked emotions or stroop task. © 2019 Institute of Information Science. All rights reserved.

Abstract
For decades, more and more experimental researches have collectively indicated that microRNA (miRNA) could play a vital role in many important biological processes and thus it also the pathogenesis of human complex diseases. It is also noticed that the resource and time cost requirement for processing data in traditional biological method is more expensive and thus more and more focusing have been paid to the enhancement of eff ective and accurate computational mechanisms for predicting potential associations between diseases. To focus towards this, researchers identified that Gene is not responsible for many Human Diseases and instead, diseases occur due to interaction of different group of genomes that is responsible for different diseases. Hence it is very important to analyze and associate the complete genome sequences and its associations to understand or predict various possible human diseases. To identify and predict the associations between diseases, We earlier proposed the Deep Learning based Intelligent Human Diseases-Gene Association Prediction Technique (IHDGAP). It employs Convolution Neural Network (CNN) algorithm which contains multiple number of hidden layers which is helping to predict Gene Patterns and its Associations to predict Human Diseases. This Research Work revealed that our previous Model, IHDGAP unable to classify boundary region. To address this issue to enhance Classification Accuracy, this research work proposed an enhanced Classifier called Deep Learning based Human Diseases Pattern Prediction Technique (ECNN-HDPT), where an Enhanced CNN is employed. The proposed model is implemented and analyzed carefully in terms of Processing Time, Memory Usage/Utilization, Accuracy, Sensitivity, Specificity and FScore. From the experimental results, it is noticed that the proposed deep learning mechanism improves the performances of the proposed classifier in terms of Classification Accuracy, Sensitivity, Specificity, and FScore as compared with our previous model Gene Signature based Hierarchical Random Forest (G-HRF) and Intelligent Human Diseases-Gene Association Prediction Technique (IHDGAP). However, it was noticed that the proposed model consumes relatively more Memory and Processing Time as we employs SVM-ECNN to train and test Patterns. Though it takes relatively more time to train the Data Sets, it is established that the Classification Accuracy is higher as compared with our previous Classifier. © International Research Publication House.

Vitamin E and C protects the liver from diclofenac-induced histopathological changes and oxidative damage in experimental animals

(2019) *Drug Invention Today*, 12 (3), pp. 434-438.

Abstract
Aim: This study was done to show the changes in the liver following diclofenac treatment and to study the hepatoprotective effects of Vitamin E and C in diclofenac treated rats. Materials and Methods: Rats were divided into four groups each six rats. Group-1: Control rats (n = 6), Group-2: Rats (n = 6) treated with diclofenac at dose of 50 mg/kg IM for 7 days, Group-3: Rats (n = 6) treated with Vitamin C at dose of 200 mg/kg orally followed by diclofenac at 50 mg/kg IM 2 h later for 7 days, and Group 4: Rats (n = 6) treated with Vitamin E at dose of 200 IU/kg orally followed by diclofenac at 50 mg/kg IM 2 h later for 7 days. Later it was analyzed with standard biomarkers, and it was histologically interpreted. Results: the results showed that there was an rapid increase in the levels of liver function test in diclofenac treated group, which was significantly decreased after pretreatment with vitamin E than vitamin c. The liver acinus showed centriacinar necrosis of hepatocytes after 7 days of diclofenac treatment, which was prevented by administration of Vitamin E and C. Discussion: Drug-induced liver injury possesses a major clinical problem and has become a leading cause of acute liver failure and transplantation. Overstressed liver compromises its detoxification role which may expose it to a variety of diseases and disorders. Diclofenac sodium is a phenylacetic acid derivative, a widely used nonsteroidal anti-inflammatory drug (NSAID) for the treatment of inflammatory conditions such as osteoarthritis, rheumatoid arthritis, polymyositis, dermatomyositis, dental pain, spondyloarthritis, acute migraine, gout attacks, and pain management in gall and renal stones. Although the exact mechanism by with diclofenac injuries liver is not understood, some studies explain the toxicity by affecting cytochrome P 450 leading to the production of active metabolites. Conclusion: hepatoprotective effects of Vitamin E were better compared to Vitamin C following treatment with NSAID. Hence, it may be necessary to administer Vitamin E in patients treated with diclofenac. © 2019 JPR Solutions.All right reserved.

Abstract

We study in this work the influence of titanium oxide (TiO 2) nano-wires (NWs) and nano-particles (NPs) addition on the flux trapping potential of YBa 2 Cu 3 O y (YBCO for brevity). Samples were characterized using various techniques, including X-rays diffraction, scanning electron microscopy, temperature dependence of resistivity under magnetic field and magnetization measurements. Three kinds of YBCO + x TiO 2 samples with x = 0.0 and 0.1 wt% were synthetized via the solid-state reaction route. The activation energy U 0 , the coherence length ξ(0), the upper critical field H c2 (0) and irreversibly field H irr are estimated and discussed in the relation to TiO 2 addition effect. The derived parameters are increased for samples containing 0.1 wt% of TiO 2 nano-entities and are more enhanced in Y–Ti NPs sample. It results therefore, that suitable amount of TiO 2 nano-particles addition can be useful tool for the manufacture of a promising YBCO compound for practical applications. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
Extensive and poorly regulated groundwater extraction to cater to agricultural, industrial, and domestic needs has severely depleted natural groundwater levels in arid and semi-arid areas. Suitable artificial recharge structures can serve as viable options for increasing groundwater levels in areas dependent on aquifers as their water source. Potential sites and suitable artificial recharge structures were suggested to recharge the groundwater level of the study area. The paper's aim is to facilitate an increase in aquifer recharge during non-rainfall days in the study area and contribute to sustainable groundwater conservation during periods of poor water availability by using remote sensing and GIS. © 2019 Technoscience Publications. Abstract
Aim: The present study is aimed to evaluate the prevalence of oral mucosal lesions among type 2 diabetic patients in Chennai, India. Methods: The study group comprised of 100 type 2 diabetic patients (n = 100), aged between 21 and 80 years attending the outpatient department of Sree Balaji Dental College and Hospital, Chennai, during a 6-month period. This was a cross-sectional observational study that comprised of a thorough clinical evaluation and diagnostic tests followed by recording of the oral mucosal lesions that were commonly observed in the above population. Results: Of the 100 patients, 56 (56%) were females and 34 (34%) were males. All the patients were among 21–80 years of age. 86 (86%) type 2 diabetic patients were found with associated oral mucosal lesions. The most common oral lesions being denture stomatitis (34%), angular cheilitis (21%), and gingival hyperplasia (20%) followed by other oral mucosal lesions. Conclusion: The above study concludes that patients with type 2 diabetes present with higher prevalence of oral lesions when compared with non-diabetics which implies the need for the dental surgeon to have a knowledge of the common oral mucosal lesions that may help to diagnose diabetes mellitus in patients who are unaware of their diabetic status and provide early treatment. © 2019 JPR Solutions. Abstract
A trend is the common direction at which the stock is moving. Based on whether the market is optimistic or pessimistic, the trends move upwards or downwards. Share market trend analysis is a part of technical analysis that tries to predict the future development of a stock based on past data. This study try to help the investors in the stock market to choose the better timing for buying or selling stocks based on the knowledge extracted from the chronicled prices of such stocks. The decision taken will be focused on decision tree classifiers which are one of the data mining techniques and by impending genetic algorithm. © 2019, World Academy of Research in Science and Engineering. Actionable info: Data mining will derive unjust data from massive volumes of information. For instance, a city planner would possibly use a model that predicts financial gain supported by demographics to develop an idea for low-income housing. An automobile leasing agency may a use model that identifies client segments to style a promotion targeting high-value customers.

Abstract
In the current developing focused market, forecasting or predicting the stock returns just as the organization's economic status will give more profits for the investors to contribute positively. Stock forecast can be done by utilizing the present and past information accessible available. Forecasting the stocks should be more exactness, scalability and less time utilization. Various enabling techniques has been taken in the field of data mining for predicting the stock market by approaching the genetic algorithms. Such as Decision Tree Classifiers, Artificial neural networks-ARIMA, Bollinger bands, RSI and so on. This survey paper review helps to know the best enabling technique tools for the predicting the stock mining how to invest, when to invest for the investors in the future. Many of the researchers has been analyzing the predictions of stock market by getting the help of Mining through genetically. © 2019, World Academy of Research in Science and Engineering. Investigation of the effect of noise stress-induced changes in behaviour and the neuroprotective role of Nelumbo nucifera seedpod and quercetin in rat brain

(2019) *Drug Invention Today*, 11 (2), pp. 378-385.

[a] Department of Physiology, Tagore Medical College and Hospitals (Research Scholar, PhD in Bharath University), TN Dr. MGR Medical University, Chennai, Tamil Nadu, India
[b] Department of Physiology, Tagore Medical College and Hospitals, TN Dr. MGR Medical University, Chennai, Tamil Nadu, India

Abstract
Background: Stress is an unavoidable phenomenon which disturbs physiological homeostasis. Stressors can have multiple effects on individuals depending on the nature of the stressors. Noise stress is an environmental stress factor, and acute as well chronic noise stress induces oxidative stress. The brain is more vulnerable to the effects of stress, affecting cognitive functions and behavior. The ethanolic extracts of Nelumbo nucifera (NNE) seedpod and its active component Quercetin (QRCT) were investigated for its protective role in ameliorating the changes induced by noise stress exposure. Materials and Methods: Adult male Wistar strain albino rats, weighing between 180 and 220 g, were used and divided into 12 groups. Animals were given drugs NNE (400 mg/kg body weight [bw]) and its active principle quercetin (40 mg/kg bw) through oral administration in different concentration 10 days before noise stress exposure. Neuroprotective role of NN seedpod and quercetin on hippocampus and medial prefrontal cortex was assessed by open field apparatus. Results: The stress group animal showed increased corticosterone levels, decreased movements, and increased immobilization time due to anxiety. However, the drug-treated animals had increased exploratory activity by moving freely with less immobilization. Among the drug groups, the active component quercetin group showed more effective anxiolytic activity than crude extract of seedpod. Conclusion: The findings of the present study showed that both the NNE and quercetin groups were effective in ameliorating the noise stress-induced changes, but the active component quercetin group had a higher protective impact on the changes.

Abstract
Nowadays, Most of them want to forecast stock prices precisely, but woeful, that is A very difficult part. To note that one cannot forecast stock prices; it is that the edge of error in the forecasts is disagreeably extensive and that the best approach to forecast stock prices is simple to the point that it is accessible without exertion to everybody. The forecast of stock price is regarded as a challenging task of fiscal time series predict. There are five techniques to examine stocks were secured to predict the closing price. The techniques used are Typical Price (TP), Bollinger Bands, Relative Strength Index (RSI) and Moving Average (MA). Data Mining helps these techniques to give better results. This research paper will discuss to forecast the closing stock price will raise or reduce by scientifically. © BEIESP.

De-noising of EEG, ECG and PPG signals and analyzing based on IoT device

(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (5), pp. 647-651.

[a] Bharath Institute of Higher Education and Research, Chennai, India
[b] SASTRA Deemed University, Thanjavur, India

Abstract
Fragile analyses of the electroencephalograph (EEG) records can manage the cost of supportive knowledge and upgraded comprehension of the components causing epileptic issue. In this examination, the predominant job of the wavelet change in the cross examination of the ECG is talked about in detail, where both the steady and the discrete change are considered thus. A Wavelet denoising is practical on the first flag to kill high recurrence noise, and after that a procedure dependent on wavelet change joined with versatile channel is useful to destroy the movement antiquity. This methodology utilizes Wavelet deterioration to extricate the movement ancient rarity, which is in this manner used as the reference contribution of a versatile channel for commotion abrogation. The strategy decreases the overhead of the circuit since it needn't bother with a different gathering of reference input flag which connect to commotion. Testing results represent that this methodology can proficiently expel movement relic and improve the flag quality. A remote framework for human heart observing/Electrocardiograph (ECG) based on IoT was proposed. Here same technique is used for EEG as well as PPG signals. So here all the three signal are taken here and monitored through raspberry-pi and updated in net using IOT. © BEIESP.

Abstract
Background: The past millennium has witnessed tremendous research regarding attempts to enhance our understanding of the etiopathogenesis of periodontal disease. Nitric oxide (NO), a free radical gas, is a noxious chemical in the atmosphere but in small controlled concentrations in the body, acts as a physiological and pathophysiological mediator and plays an important role in biological systems. It is known that stress mechanisms contribute to onset, exacerbation, and maintenance of oral inflammatory diseases and it is also known to generate a plethora of free radicals including NO. Hence, this study performed to explore the salivary NO levels and correlate it with chronic periodontitis and the patients stress level. Materials and Methods: A total of 60 subjects who were in the age group of 30-55 years, who participated in this study participated and were divided into two groups: Group I, which includes 20 healthy nonsmoking subjects and Group II, 20 subjects who are non-smokers with chronic periodontitis. The biochemical estimation of NO in the collected saliva was performed using the Griess colorimetric reaction. The measurement of stress levels for all the patients was requested to fill up a stress audit questionnaire by Miller and Smith to measure their stress levels.Statistical Analysis and Results: The statistical comparisons were done under the Griess Reaction. There were statistically significant salivary levels of NO in the group of periodontitis (group II) as compared to those in the healthy controls (group I). The collected data were subjected to statistical analysis through SPSS for windows (version 16.0). The statistical methods applied were descriptive statistics, one-way analysis of variance, Scheffe's post hoc test, correlation analysis, independent samples t-test, and regression analysis. Conclusion: NO plays an important complex role in the immunoinflammatory process and the remodeling and maintenance of osseous structures. The salivary NO levels which are increased in patients with periodontitis and the positive correlation of salivary NO levels with the patients stress levels in this present study indicated NO being a potent modulator of inflammatory disease processes. © 2019 JPR Solutions. COMPACT: Classifying stream data optimally using a modified pruning and controlled tie-threshold
(2019) *International Journal of Innovative Technology and Exploring Engineering*, 8 (4), pp. 512-519.

[a] Bharath Institute of Higher Education and Research, Chennai, India
[b] Kakatiya Institute of Technology and science for woman, Nizamabad, Thlangana, India

Abstract
Big data mining become important in extracting the potential information from the continuously arriving stream data. By extracting knowledge, the data mining algorithms significantly compute feasible decisions for various applications. The Very Fast Decision Tree (VFDT) classifier is a widely applied incremental decision tree to make better decisions. The VFDT classifier processes the arrival of the new instances, without storing them and updates the existing tree structure. Most of the conventional incremental decision tree based algorithms exploit the hoeffding's bound based on the user-defined tie-threshold to split the tree and to manage the tree growth. Even though the size of the tree tremendously increases when handling the fluctuated and imbalanced stream data, it suffers from the misclassification issue due to lack of capturing the optimal attributes over the incoming stream data and declines the classification accuracy and performance. In order to resolve these issues, this paper extends the VFDT, named as Classifying stream data optimally using a Modified Pruning technique And Controlled Tie-threshold (COMPACT). The COMPACT method includes two components, such as enhanced information gain measurement and tie-breaking threshold based pruning method. In order to improve the VFDT performance without affecting the imbalanced data stream handling, the enhanced information gain measurement effectively identifies an optimal number of attributes for a data stream. In order to avoid the information gain biasing, it utilizes the advantages of enhanced splitting metric in attribute reduction. Instead of randomly selecting the threshold, the tie-breaking threshold based pruning method determines the tie-breaking threshold using a number of breaking points. The tie-breaking threshold based pruning method ensures the optimal tree structure while handling the large-scale stream dataset. Finally, the COMPACT method is evaluated using the weather dataset to demonstrate the efficiency. The proposed method significantly outperforms the existing DTFA approach in terms of recall, Root Mean Square Error (RMSE) rate, and execution time. © BEIESP.

Abstract

Background: Today's pharmaceutical markets are crowded with antibacterial agents, yet their toxicities and resistance are always contentious. Azadirachta indica is used in India as an age-old treatment for diverse medical conditions. This study was put forth to analyze the antibacterial action of A. indica bark extract on different bacterial pathogens. Materials and Methods: A. indica bark extract was prepared using Soxhlet extraction method. The bark extract of A. indica was screened for antibacterial activity by agar well diffusion assay technique against Staphylococcus aureus, Enterococcus faecalis, Pseudomonas aeruginosa, and Proteus mirabilis. Ciprofloxacin (5 μg per disc) was used as positive control. All assays were carried out under strict aseptic precautions. All the concentrations included were duplicated, and the results obtained were the average of two independent experiments. Broth microdilution method was used to study the minimum inhibitory concentration of the bark extract of A. indica. Results: A. indica bark extract has shown antibacterial activity against all concentrations of bark extract, whereas antibacterial activity against S. aureus was observed at higher concentration of >500 μg/mL. The bark extract of A. indica showed zone of clearance against E. faecalis, P. aeruginosa, and P. mirabilis at all concentrations. Zone of inhibition was observed in higher concentrations against S. aureus. Conclusion: This study has shown that A. indica bark extract has a potent antibacterial property against S. aureus, E. faecalis, P. aeruginosa, and P. mirabilis. Further isolation of bioactive compounds may lead to a new scope in the treatment of bacterial infections. © 2019 Journal of Pharmacy and Bioallied Sciences | Published by Wolters Kluwer-Medknow.

Abstract
This paper attempts to classify various possible reasons for customer satisfaction or dissatisfaction, especially focusing on Product Design. Taking an example of Automotive Industry. It further deep dives to understand customer expectations and how to ensure those elements are captured in the early design stage itself. It also suggests a method to fine-tune the current development model, to be proactive in securing customer satisfaction after the product is launched. © IAEME Publication

Abstract
A composite material is a combination of two or more different materials and it plays a vital role in a wide range of applications. In automotive and mechanical industries the demand for lighter weight components is increasing day by day. Glass and flax reinforced composites have superior properties such a high tensile strength at any weather conditions. As the composite materials are used in many applications and exposed to harsh environment, the water molecules from the environment may induced in to the material then reinforcements may be affected and which causes damage to the interface bonding. In this work the effect of hygrothermal environment on hybrid fiber reinforced composites are studied, two types of composite laminates are prepared one is glass fiber reinforced composite (GFRC) and the other is glass and flax fiber reinforced hybrid composite (HFRC). Tensile test samples are cut from the laminates prepared as per ASTM D 638 standard and the tensile strength values before and after hygrothermal exposure are identified and compared from the result it is presumed that hybrid materials are showing better resistance towards hygrothermal behaviour compare to mono glass fiber composites. © 2019 Asian Journal of Chemistry. Reconfigurable communication wrapper for QoS demand for network on chip
(2019) *International Journal of Advanced Intelligence Paradigms*, 12 (1-2), pp. 24-32. Cited 1 time.

DOI: 10.1504/IJAIP.2019.096949

Abstract
Efficient communication wrapper design is one of the important research issues in network on chip. A single wrapper with fixed design parameter will not be efficient one for the heterogeneous environmental network on chip scenario. The system on chip has many different computing and communication blocks with different data rate and data format. To interconnect such a heteronymous block a standard-based wrapper framework such as OCI wrapper are proposed. But such standard wrapper does not support the QoS demand of the every block. So this work proposes a framework of reconfigurable communication wrapper design with support of QoS. The proposed framework is simulated in LABVIEW software and tested on National Instruments FlexRIO 7845R FPGA hardware. The result shows that on the fly re-configurability is achievable with the framework. Copyright © 2019 Inderscience Enterprises Ltd.

Abstract
This paper proposes to model the dynamic interaction of the complex emotions excited by audiovisual stimuli. The behavior of the user is modeled through Markov chain procedure, and the transition probabilities are calculated. A parameter variation study of the dynamical behavior is undertaken to examine the scope of chaos and stability, thus leading to the derivation of the extent of stability. The arch motive of the paper lies in the prediction of chaos and stability of emotional dynamics from the instantiation of emotion in facial expression stimulated by external audiovisual impetus. Such prediction may help in the early discovery of mental disorders. © Springer Nature Singapore Pte Ltd. 2019

Abstract
Functional near-infrared spectroscopy is an optical non-invasive technique for measurement of neural activity and hemodynamic response and has a potential for brain mapping. In this work, we aimed to develop a system to capture the cranial photoplethysmogram (CPPG) using IR source (860 nm) and detector (OPT 101). AC excitation for the IR source in the range of 1−2 MHz plays a major role in the CPPG sensor. Brain functional activity in prefrontal lobe is detected by placing the sensor on the forehead. The CPPG signal is captured with eyes open (EO) and eye blinking (EB) activity for various emotions (happy and sad) on prefrontal lobe. Data acquisition is done using AVR ATmega 8535 microcontroller at a sampling rate of 500 Hz. The data are acquired from subjects in the age group of 20−60 years. Using Daubechies 9, six-level wavelet decomposition of CPPG signal is performed, and spectral analysis of each level is done using Welch's method. From the spectral analysis, it is found the centre frequency of A6 is at 1.953 Hz. The higher frequency part of the signal is found in D4 scale and the centre frequency is 17.58 Hz. All other scales D3−D1 show predominantly the noise part of the signal. Statistical features of A6 and D6 decomposition levels are important for analysis and classification of activity. © Springer Nature Singapore Pte Ltd. 2019.

Abstract
In endeavor toward better understanding of brain functions, the analysis of information transfer between the various brain lobes plays a crucial role. Electroencephalogram (EEG) is an electrical brain signal in microvolts, which provides unique and important information about the brain dynamics. Frequency of EEG signal lies between 0 and 100 Hz. In epileptic or seizure related studies, decomposition of EEG signal into various frequency sub-bands such as α, β, δ, θ, and γ is essential. EEG plays a key role in diagnosis of neurological disorders such as epilepsy. In this paper, we explore decomposition of EEG by db18 wavelet, power spectral density, coherence, energy distribution, and empirical cumulative distribution function of EEGs. This work was carried out to study the changes in the normal and epileptic EEGs with respect to PSD, coherence, energy, and ECDF to check the suitability of these parameters as an input to the classifiers. The methodology was applied mainly to three groups consisting of male and females between the age group of 01–107 years: (1) healthy subjects (normal), (2) subjects with focal seizures, (3) subjects with generalized seizures. The work was carried out on the signals obtained from real subjects to study the EEG-based brain connectivity analysis. It was observed that PSD and coherence study related to the sub-bands reveal more accurate information than the study of complete EEG with or without the seizures. © Springer Nature Singapore Pte Ltd. 2019.

Abstract
Background: Synthesis of silver nanoparticles (AgNPs) through biological route plays an important role in their applications in the medical field, especially in the prevention of disease causing microbial pathogens and arresting the propagation of cancer cells. The stable, green synthesis of AgNPs is very much welcomed in the medical field because of their low toxicity. Therefore, the demands of AgNPs synthesised biologically is on the rise. The present study aimed to investigate the antimicrobial mechanisms and anticancer properties of the AgNPs synthesized using the seed extract of Trigonella foenum-graecum L. The AgNPs were characterized by UV–vis, SEM, XRD, FTIR and EDAX analysis. The minimum inhibitory concentrations (MIC) of the AgNPs were determined by the broth micro dilution method. Results: The formation of brownish red color indicated the formation NPs with the absorption maximum at 420 nm. The average size was found to be 33.93 nm and sphere shaped. The FTIR spectrum revealed the absorption bands at 3340 cm−1 and 1635 cm−1 indicated the presence of –OH or –COOH and amide group stretching in the AgNPs. The X-ray diffraction report confirmed the presence of strong peak values of 2θ within the angle of 37.1°. The lowest MIC of the AgNPs against Staphylococcus aureus was 62.5 μg mL−1. MIC values against Escherichia coli and Klebsiella pneumonia, were 125 and 250 μg mL−1 respectively. The MIC of the AgNPs against Aspergillus flavus, Trichophyton rubrum and Trichoderma viridiae were each 250 μg mL−1, respectively. The extracellular protein concentration, levels of lactate dehydrogenase and alkaline phosphtase enzyme in the AgNPs treated bacterial pathogens demonstrated greater antimicrobial mechanism. Additionally, the AgNPs exhibited significant anticancer activity against the MCF7 and Vero cell lines. Conclusion: The synthesized AgNPs could be further evaluated in large scale as a botanical antimicrobial agent. © 2017 The Authors

Abstract
In the study on “Performance and Emission Studies on a four stroke internal-combustion engine mistreatment alkyl organic compound of algae oil with EGR”, a detailed investigation of characteristics (performance and emission) of Blends of alkyl Esters of protoctist oil by varying the EGR management price (5 to 20%) mistreatment with direct injection internal-combustion engine was made. From the preceding studies on similar title, it has been established that the discharge in Night is higher in protoctist, primarily based on biodiesel. This paper from the present study focuses on the Night emission, and the way it is reduced by mistreatment with the cooled EGR. © TJPRC Pvt. Ltd.

Abstract
This present study is to progress the arithmetical model that might be utilized to determine the corrosion rate (CR) of Al–12Si-x B 4 C (x = 0, 4, and 8 wt. % of B 4 C) composites have faith in densification of the powder metallurgy throughout compaction and sintering. The acidic solutions used for corrosion is 1 N HCl, 1 N H 2 SO 4 and 1 N HNO 3 for varying plummeting time (i.e., 72, 144, and 216h) correspondingly. The hardness of the composites will rise because of the increased wt. % of B 4 C. The result indicates that with the enhancement of nanoB4C particles into the matrix decrease the corrosion rate respectively. The corrosion behaviour of composites was studied by SEM and corrosion rate method. As input parameters such as reinforcement, acid and time were designed by RSM design and the response parameter was corrosion rate was obtained experimentally by the corrosion rate method. The L17 orthogonal array was selected for investigating the response surface methodology (RSM) design using three factors with one replicate. RSM design was investigated for the evaluation of interactions between response parameter and input parameters. Analysis of variance was utilized to explore the influencing input factors on corrosion rate (CR). The corrosion rate specifies varying results depending on the input values of the response parameters. The outcomes revealed that all the parameters had significant effects on the corrosion rate at 95 % confidence level. © TJPRC Pvt. Ltd.

Abstract
This present study is to develop the statistical model that might be used to forecast the wear of Al–12Si-x B 4 C (x = 0, 4, and 8 wt. % of B 4 C) composites have faith in densification of the powder throughout compaction and sintering. The L17 orthogonal array was selected for investigating the response surface methodology (RSM) design using three factors with one replicate. Analysis of Variance (ANOVA) was utilized to explore the influencing input factors on Wear Loss (WL). The hardness of the composites will rise because of the increased wt. % of B 4 C. The Pin-on-disc and Scanning Electron Microscope (SEM) were used to examine the wear and friction, and characterization of Al–12Si-x B 4 C composites respectively. The mathematical model was applied by design expert software so as to precise the influence degrees of the most wear variables like reinforcement, sliding distance and load on WL. The results specify that the load and sliding distance is that the dominant factor affecting WL mainly. © TJPRC Pvt. Ltd.

A new construction methodology based convective heat transformer enhancement and emission reduction and power reservoir systems

(2018) *International Journal of Mechanical and Production Engineering Research and Development*, 8, pp. 1587-1602.

[a] Bharath Institute of Higher Education and Research, Chennai, Tamil Nadu, India
[b] Department of Civil Engineering, Anna University Regional Center, Thiruchirappali, Tamil Nadu, India

Abstract
Numerical simulation of a geothermal reservoir, modeled as a bottom-heated square box, filled with water-CO 2 mixture is presented in this work. In first part, results for two limited cases of a reservoir filled with either pure water or CO 2 are presented. Effects of different parameters including CO 2 concentration as well as reservoir pressure and temperature on the overall performance of the system are investigated. With a fixed reservoir pressure and temperature, any increasein CO 2 concentration leads to better performance, that is, stronger convection and higher heat transfer rates. With a fixed CO 2 concentration, however, the reservoir pressure and temperature can significantly affect the overall heat transfer and flow rate from the reservoir. The second part calculates amount of CO 2 , SO 2 , NO and particulate matters emissions from main grid and from μ sources which forms micro grid. The results indicates that more penetration of μ sources in the power systems especially the renewable sources will help in reducing or removing emission problems and solve the green house gas problems. Finally this paper proved with calculations that the micro grid can solve most of the problems which facing the conventional power system and keep the surrounding environment clean from pollution and the micro grid will be the future power system. Geothermal cogeneration or Combined Heat and Power (CHP) plant is the use of a heat engine or power station to simultaneously generate electricity and useful amount of heat from a single process. An advanced focus on sustainability will be made industrial CHP Plant more attractive, as it substantially reduces the carbon footprint when compared to generating steam or burning fuel on-site and importing electric power from the grid. © TJPRC Pvt. Abstract
The Vehicular ad-hoc networks (VANETs) have been studied to improve operator's safety and ease. In VANETs, all vehicles send their position and road conditions with adjacent nodes by periodically sending secure messages. To give staunch VANET services, message authentication is a powerful feature. In particular, undisclosed message authentication has brought about great interest, because intervallic broadcast messages from a vehicle can be used to track its location. Lamentably, earlier suggested anonymous message authentication protocols had serious practical disadvantages, like high communication, authentication, and revocation costs, as well as reliability issues. Thus, this paper suggests an anonymous authentication protocol based on a cooperative authentication method. The proposed method does not require mode synchronization between cooperative and non-cooperative authentication. Besides, designed a two-layer pseudo-identity generation method and develop a key update tree for efficient revocation. Simulations illustrate that the researched protocol does not result in packet losses caused by authentication overheads. © IAEME Publication.

Abstract
Usually the vehicles are running in the urban and rural environment. Those vehicles can be communicating each other using some architectures and protocols. The communication can be possible with vehicle to vehicle (V2V) or vehicle to some pre erected infrastructures (V2I). If the module used both type of communication, then it is called hybrid architecture. There are some protocols used by the vehicles to communicate with each other. This paper proposes the Zone Hierarchical Link State protocol (ZHLS) with gate flooding, which is the sub classification of topology based hybrid routing protocol and the implementation of the hybrid architecture of both V2V and V2I communications in the Intelligent Vehicular Ad Hoc Network (InVANET). The set of complete module of this proposed architecture is controlled and operated by the Deep Neural Network (DNN) and the outcomes of the proposal are simulated with MATLAB. The major aim of this proposal is to implement the efficient communication between the vehicles by reducing the real time complications. The complications in real time implementation are concentrated by the DNN. © IAEME Publication.

Alpha-amylase and alpha-glucosidase inhibitory effects of calliandra haematocephala and its potential role in diabetes mellitus

(2018) *Asian Journal of Pharmaceutical and Clinical Research*, 11 (12), pp. 429-432.

DOI: 10.22159/ajpcr.2018.v11i12.28517

Abstract
Objective: The global burden and the high prevalence of diabetes mellitus in India signify the importance of its control with effective measures. Particularly, intestinal alpha-amylase and alpha-glucosidase enzyme inhibitors reduce postprandial hyperglycemia and play a key role in preventing diabetic complications. Herbal plants also possess greater antioxidant, enzyme inhibitory, and antihyperglycemic activities with minimal side effects. Hence, this study is done to elucidate the inhibition of alpha-amylase and alpha-glucosidase enzyme activity and antidiabetic potential of Calliandra haematocephala. Methods: The leaves of C. haematocephala extracted by ethanol as a solvent were used to elucidate the blocking of alpha-amylase and alpha-glucosidase enzymes for antidiabetic effect, and the absorbance was measured using spectrophotometry. The percentage of inhibition and half maximal inhibitory concentration (IC50) value of the plant and control were calculated. Results: The maximum percentage inhibition of C. haematocephala against alpha-amylase was 61% (IC50 value of 82.18 µg/ml) and alpha-glucosidase was 71% (31.07 µg/ml). The maximum percentage inhibition of acarbose against alpha-amylase was 92% (IC50 value of 42.65 µg/ml) and alpha-glucosidase was 89% (62.28 µg/ml). Conclusion: Hence, the above study proved the antidiabetic activity of C. haematocephala and its significant role in the pharmacotherapy of diabetes mellitus. © 2018, Innovare Academics Sciences Pvt. Comparative analysis of the anticancer activity of angiotensin receptor blockers-irbesartan and telmisartan
(2018) *Asian Journal of Pharmaceutical and Clinical Research*, 11 (12), pp. 403-406.

DOI: 10.22159/ajpcr.2018.v11i12.27948

Abstract
Objective: Angiotensin receptor blockers (ARBs) are effective hypertensive drugs. Reduction in risk of lung cancer with ARBs was proven in clinical studies. Telmisartan and irbesartan are the second-generation ARBs. This study screens the anticancer activity of these two drugs in a dose-dependent manner using A549 cell line. Methods: Different concentrations of irbesartan and telmisartan were treated on A549 cells and the anticancer activity was evaluated through methylthiazolyldiphenyl-tetrazolium [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] cytotoxicity assay. The dot plot of the cytotoxicity results was used to extrapolate the half maximal inhibitory concentration (IC50) values. Microscopic changes in the cells post-treatment with these drugs were also recorded at ideal concentrations. Results: A reduction in cell viability was noted in A549 cells with increasing concentration of the drug. The IC50 values for irbesartan and telmisartan were 31.1 µg and 15.6 µg, respectively. Microscopic observation of the cells shows more rounded and deformed dead cells on telmisartan-and irbesartan-treated cells when compared with the untreated control. Conclusion: The results confirm the anticancer activity of both the drugs with telmisartan being more efficient. The anticancer activity could probably be due to the role of irbesartan and telmisartan in inhibiting mitogen-activated protein kinase cell survival pathway and local angiogenesis. © 2018, Innovare Academics Sciences Pvt. Abstract

Background: T. forsythia a gram negative, anaerobe inhabits the mature biofilm present at sites expressing progressive periodontitis. It is a part of “red complex” group which contributes to the pathogenesis of periodontitis. The BspA protein and prtH gene encoded cysteine protease play a vital role in the virulence of T. forsythia. The present study aims to detect the two genotypes (bspA and prtH) in periodontitis and healthy subjects. Materials & Method: Subgingival plaque samples were collected from periodontitis patients and healthy subjects (Chronic Periodontitis n = 128, Aggressive Periodontitis n = 72, healthy subjects n = 200). The samples were screened for the presence of T. forsythia 16S rRNA, bspA and prtH genotypes by Polymerase Chain Reaction. The prevalence of the genotypes between periodontitis patients and healthy subjects was compared with Pearson's Chi-square test. A P value of < 0.05 was considered to be statistically significant. Results: The prevalence for T. forsythia in Chronic Periodontitis (n = 128), Aggressive Periodontitis (n = 72) and health (n = 200) was 73.4%, 59.7% and 10.5% respectively. The prevalence of T.forsythia bspA/prtH genotypes was 81.90%/43.60%, 88.40%/53.50% and 33.30%/14.3% in Chronic Periodontitis, aggressive Periodontitis and health respectively. Compared to healthy subjects, the odds of detecting T.forsythia 16S rRNA was 18.53 times high in individuals with periodontitis (P = 0.0001). Conclusion: The high odds ratio of T.forsythia 16S rRNA among periodontitis strongly suggests its role in periodontitis. In addition, the high prevalence of T. forsythia bspA genotype among Chronic Periodontitis signifies it as a useful marker for chronic periodontitis. © 2018 Elsevier Ltd

Abstract
Numerical investigation of heat transfer analysis was taken with different flow rates using CFD simulation. A commercial CFD package of fluid simulation in solid works was used to analyses the heat transfer and friction factor characteristics. In this present study the double pipe heat exchanger for a plain tube and twisted tape with the triangular cut copper material inserts, the heat transfer from hot water to cold water by was experimentally investigated. In this paper CFD analysis was used for heat transfer enhancement of laminar flow of water as a working fluid. In a circular tube fitted with triangular cut twisted tape inserts with twist ratio Y = 5.4 and 1.2 cm cut depths of triangular cut was used for flow analyses. A plain twisted tape caused a swirling motion and triangular cut used for the heat transfer augments. In addition that, a triangular cut twisted tape inserts increases the surface contact area of the flow motion. The performance of heat transfer characteristics, Reynolds number and Nusselt number were analyzed using flow analysis. The data obtained from the simulation analysis and these data were correlated with plain twisted tape inserts. The performance of heat transfer characteristics of triangular cut twisted tape was enhanced compared with smooth plain twisted tape. © 2018 Author(s).

Effect of lattice strain on structure, morphology and magneto-dielectric properties of spinel NiGdxFe2−xO4 ferrite nano-crystallites synthesized by sol-gel route

(2018) *Journal of Magnetism and Magnetic Materials*, 466, pp. 238-251. Cited 108 times.

Abstract
Nanocrystalline powders of Gadolinium (Gd3+) substituted nickel ferrite spinel (NiGdxFe2−xO4: x = 0.00, 0.025, 0.050, 0.075 and 0.1) samples were synthesized via sol-gel method. Nickel nitrate hexahydrate and Ferric nitrate hexahydrate were used as the precursors and rare earth Gadolinium nitrate hexahydrate [Gd(NO3)3·6H2O] was used as the dopant. The structural, morphological, magnetic and dielectric properties of the synthesized nanoparticles were examined by XRD, FTIR, HRSEM, EDX, TEM, VSM and dielectric studies. The Scherrer method and Williamson-Hall (W-H) method were used to evaluate the crystallite sizes and lattice strain. The crystallite size of NiGdxFe2−xO4 samples were found to decrease from 25 nm to 11 nm with increase in Gd3+ content. Lattice parameters decrease and lattice strain increases with the increase in Gd3+ content in the sample. HRSEM images showed the spherical morphology and uniform size distribution. The elemental composition analysis confirms the stoichiometric presence of expected elements in the samples. The crystallite size and the particle size calculated from the XRD analysis and HRTEM monographs indicate the correlation of the data obtained from both the measurements. Magnetic studies of the samples were performed using vibrating Sample Magnetometer, in which magnetizations (Ms) decrease with increase in Gd3+ concentration from 36.51 emu/gm to 19.69 emu/gm. As the gadolinium content was gradually increased, coercivity and remnant magnetization were also decreased. Magnetic anisotropy of nickel ferrite was also found to decrease with increasing gadolinium content. The saturation magnetization values were achieved by using the “Law of Approach (LA) to Saturation magnetization” technique. Specific correlation between magnetic interaction and lattice strain was observed in Gd3+ substituted nickel ferrite. Dielectric parameters such as dielectric constant and dielectric loss of the prepared samples decrease with increase of applied frequency and increasing of Gd3+ doping concentration. © 2018 Elsevier B.V.

Abstract

Security threat is the chief problem in 'mobile adhoc networks' (MANET). The effectiveness of the MANET is influenced via the malicious nodes' existence. It is an extremely hard job for recognizing the malicious nodes (MN) as of the faithful nodes in MANET owing to related traits betwixt MA and trusty node. An effective feature extraction centered MN detection system with GA in addition to ANFIS approach is proposed. Features like trust factor, service trust features, and weightage are extorted as of trusty and MNs. The finest attributes are selected utilizing GA; the extorted sorts are proficient in addition categorized utilizing ANFIS. The proposed MN detection's performance on MANET is examined concerning ordinary packet loss ratio, throughput, and also detection ratio. The outcomes showed the domination of the proposed work. © 2018 American Scientific Publishers All rights reserved.

Inducible clindamycin resistance among clinical isolates from a tertiary care hospital
(2018) *Research Journal of Pharmacy and Technology*, 11 (11), pp. 5008-5012. Cited 1 time.

Abstract
Background: Clindamycin is an important drug in the treatment of various Staphylococcal infections and inducible clindamycin resistance can lead to treatment failure with clindamycin. As methicillin resistance in Staphyloccusspp is quite common, Clindamycin could be used for the treatment of Methicillin resistance Staphylococcus aureus (MRSA) infections as well as infections produced by Coagulase negative staphylococcus (CoNS). Aims: To detect and to find the prevalence of clindamycin resistance among the clinical isolates of Staphylococcus spp. by D test method. Materials and Methods: A total of 573 clinical isolates were tested for inducible clindamycin resistance by disk approximation test (D test). Results: Among the clinical isolates Staphylococcus aureus were 376 (65.6%) whereas Coagulase negative Staphylococcus (CONS) were 197(34.4%). From the isolated strains-Methicillin resistant Staphylococcus aureus (MRSA) was 191(33.3%), Methicillin sensitive Staphylococcus aureus (MSSA) was 185(32.3%), Methicillin resistant coagulase negative staphylococcus (MRCONS) was 87(15.2%) and Methicillin sensitive coagulase negative staphylococcus (MSCONS) was 110(19.2%). Inducible clindamycin resistance (iMLS B) was observed to be 57 (15.2%) in Staphylococcus aureus group and 43 (21.8%) among Coagulase negative Staphylococcus group. Conclusion: Detection of inducible clindamycin resistance by a simple D test helps to avoid treatment failure with clindamycin. © RJPT All right reserved.

Abstract
This present study is to develop the statistical model that might be used to forecast the friction of Al–12Si-x B4C (x = 0, 4, and 8 wt. % of B4C) composites have faith in densification of the powder throughout compaction and sintering. The L17 orthogonal array was selected for investigating the response surface methodology (RSM) design using three factors with one replicate. Analysis of Variance (ANOVA) was utilized to explore the influencing input factors on Coefficient of Friction (CoF). The hardness of the composites will rise because of the increased wt. % of B4C. The Pin-on-disc and Scanning Electron Microscope (SEM) were used to examine the CoF, and characterization of Al–12Si-x B4C composites respectively. The mathematical model was applied by design experts software so as to precise the influence degrees of the most friction variables like reinforcement, sliding distance and load on CoF. The results specify that the load and sliding distance is that the dominant factor affecting CoF mainly. © IAEME Publication.

[d] Department of Mechanical Engineering, PSN College of Engineering and Technology, Tirunelveli, Tamilnadu, India

Abstract
This present study is to progress the arithmetical model that might be utilized to determine the weight loss of Al–12Si-x B4C (x = 0, 4, and 8 wt. % of B4C) composites have faith in densification of the powder metallurgy throughout compaction and sintering. The acidic solutions used for corrosion is 1 N HCl, 1 N H2SO4 and 1 N HNO3 for varying plummeting time (i.e., 72, 144, and 216h) correspondingly. The hardness of the composites will rise because of the increased wt. % of B4C. The result indicates that with the enhancement of nanoB4C particles into the matrix decrease the weight loss respectively. The corrosion behavior of composites was studied by SEM and weight loss method. As input parameters such as reinforcement, acid and time were designed by RSM design and the response parameter was weight loss was obtained experimentally by weight loss method. The L17 orthogonal array was selected for investigating the response surface methodology (RSM) design using three factors with one replicate. RSM design was investigated for the evaluation of interactions between response parameter and input parameters. Analysis of variance was utilized to explore the influencing input factors on Weight Loss (WL). The weight loss specifies varying results depending on the input values of the response parameters. The outcomes revealed that all the parameters had significant effects on the weight loss at 95 % confidence level. © IAEME Publication

Abstract
Experimental investigations on the flexural and shear behavior of RC beams strengthened using continuous glass fiber reinforced polymer (GFRP) sheets. Two sets of beams were casted for this experimental test program. In SET I six under reinforced concrete beams were casted, out of which three control beams and other three beams were strengthened using continuous glass fiber reinforced polymer (GFRP) sheets for flexure test. In SET II six under reinforced concrete beams were casted; out of which three control beam and other three beams were strengthened using continuous glass fiber reinforced polymer (GFRP) sheets for shear test. Experimental data on load, deflection and failure modes of each of the beams were obtained. The effect of GFRP layers and its orientation on ultimate load carrying capacity & failure mode of the beams are investigated. © 2018 IAEME Publication.

Abstract
Background: Trigonella foenum graceum (Fenugreek) seeds are commonly used in India as traditional medicine for Diabetes, Dysmenorrhea, lactation and arthritis. The gastro-protective role of Fenugreek seeds are yet to be explored. Objectives: To evaluate the effect of Fenugreek seed extract in Indomethacin induced gastric ulcer models. Materials and Methods: Albino wistar rats were divided into five groups with eight animals in each. Gastric ulcer was induced using Indomethacin 20 mg/Kg. Fenugreek at dose of 200 mg/Kg and 400 mg/Kg was administered to group III, IV and group V received Rantidine 30 mg/Kg. Ulcer index, volume of gastric juice and acidity was estimated. To study the anti-oxidant property the level of catalase, SOD, GST and T. Bars were done. Results: Fenugreek treated group III showed a significant decrease in ulcer index, volume of gastric juice and acidity when compared to control positive group II. Oxidative enzyme study indicated a significant increase in Catalase, SOD and GSH value in treated group when compared with control positive group II and significant decrease in T. Bars value in treated group. Conclusion: Fenugreek seed extract has both gastro-protective and Anti-oxidant property. © 2018 Phcog.Net.

Abstract

Copper molybdate (CuMoO4) nanoparticles (NPs) were synthesized by microwave combustion method and urea act as the fuel. The formation of nanocrystalline structure was confirmed by X-ray powder diffraction (XRD). The chemical composition of the CuMoO4 NPs was investigated by Fourier transform infrared (FT-IR) spectroscopy. Scanning electron microscope (SEM) associated with energy dispersive X-ray (EDX) was used to investigate morphological and elemental composition of the prepared sample. The morphology and particle size of sample were investigated by high-resolution transmission electron microscope (HR-TEM) analysis. The optical and electronic defects were confirmed by the UV-Vis absorption and photoluminescence (PL) spectroscopy at room temperature (RT). The magnetic behavior was analyzed by vibrating sample magnetometer (VSM) analysis recorded at RT. The X-ray Photoelectron spectroscopy (XPS) was used to analyze the chemical state of the elements in the prepared sample. The electrochemical behavior was examined by cyclic voltammetry (CV), galvanostatic charge and discharge analysis (GCD) and electrochemical impedance spectroscopy (EIS). The presence of redox pairs is showed in CV curves and along with the EIS data showed the supercapacitor nature. The GCD analysis displayed discharge curves and a high specific capacitance of ~ 127 F/g was acquired at a stable discharge current density (1 mA/cm2). The cyclic stability analysis showed capacitance retention of about 82.5% after 1000 cycles, proposing the potential application of CuMoO4 in energy storage devices. © 2018 Elsevier Ltd and Techna Group S.r.l.

Abstract
We report a comparative investigation between the two high temperature superconductor materials YBa2Cu3O7-δ (Y-123) and Y3Ba5Cu8O18±δ (Y-358) by probing the impact of high-energy ball milling (HEBM) technique on the microstructure, transport properties and pinning capacities. Products were elaborated via the solid-state reaction (SSR) by employing two kinds of milling; hand grinding in agate mortar and HEBM in a planetary crusher. The morphology, chemical compositions and crystal structure of all produced products were explored by scanning electron microscope (SEM) along with EDXS and X-ray diffraction (XRD). The superconductivity was confirmed by electrical resistivity measurements. The transport and intra-granular critical currents densities were estimated through the current–voltage and magnetization measurements. The planetary HEBM process generates nano-sized Y-deficient Y-123 and nano-sized Y-deficient Y-358 entities dispersed in the Y-123 and Y-358 matrix, respectively. The Y-358 sample milled by HEBM exhibits the best pinning capacity. This result can be ascribed to the occurrence of more disorder in Y-358 compound compared to Y-123 one. © 2018 Elsevier Ltd and Techna Group S.r.l.

Abstract
ZnO, ZnO:Ni2+ and ZnO:Co2+ nanoparticles (NPs) were prepared via hydrothermal process. The synthesized samples were characterized by using various techniques such as, FT-IR, powder XRD, SEM-EDX, TEM-SAED, UV–Visible, PL and BET. The as-synthesized ZnO, ZnO:Ni2+ and ZnO:Co2+ NPs exhibit strong physicochemical properties including in structural, surface morphology, chemical composition, surface area, optical and photocatalytic activity were comparatively investigated as function of Ni2+ and Co2+ doping. UV–Visible absorption spectra exhibit blue shifted in absorption edge of ZnO, ZnO:Ni2+ and ZnO:Co2+ NPs compared to bulk counterparts. The photocatalytic activity of the ZnO, ZnO:Ni2+ and ZnO:Co2+ NPs have been evaluated by monitoring the degradation of MeB and RhB dyes under UV light irradiation. In degradation efficiency, 84 and 93% of the MeB and RhB dyes is degraded in the presence of the ZnO:Ni2+ and ZnO:Co2+ photocatalyst under optimum experimental conditions. The rate of de-coloration of MeB and RhB dyes are detected by UV–Visible absorption spectroscopy and organic dye mineralization is confirmed by table of carbon study. In addition, the mechanism of the photocatalytic degradation of MeB and RhB dyes has been briefly discussed. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
Spinel CuCrxFe2−xO4 (0.0 ≤ y ≤ 1.0) nanoparticles were fabricated by co-precipitation. X-ray diffraction proved the pureness and cubic crystal assembly of products which have the crystallite sizes varying between 16 and 33 nm. The cubic morphology and expected chemical composition, spectral analyses of all sample were accomplished via Scanning electron microscopy along with Energy Dispersive X-ray spectroscopy and Fourier transform infrared spectroscopy respectively. Magnetic and optical characterization of samples were done via Vibrating sample magnetometer, Mössbauer spectroscopy and Diffuse reflectance spectroscopy. Kubelka–Munk model was applied to UV–Vis data for calculating the optical Eg (band gap) values between minimum 1.20 and maximum 1.80 eV. Mössbauer analysis determined the consequence of Cr3+ substitution on isomer shift and quadrupole splitting of all products etc. The specific magnetization (σ-H) hysteresis curves have finite coercivity (in a range of 35–410 Oe) and retentivity (in a range of 0.33–3.84 emu/g) values and reveal the soft ferrimagnetic nature of spinel CuCryFe2−yO4 nanoparticles (NPs). The estimated saturation magnetization Ms value of 35.17 emu/g is maximum for pristine CuFe2O4 NPs and decreases to minimum value of 1.57 emu/g for CuCr0.4Fe1.6O4 NPs due to Cr3+ ion substitution. The calculated squareness ratios less than 0.5 assign the uniaxial anisotropy for all CuCryFe2−yO4 NPs. The magneto-crystalline anisotropy field (Ha) values less than 10.0 kOe except for the composition of CuCr0.2Fe1.8O4 NPs are other magnetic data to reveal the soft magnetic character of samples. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Author Keywords
Hexafferites; Hyperfine interactions; Magnetic properties; Mossbauer spectroscopy; Optical materials/properties

Index Keywords
Anisotropy, Chemical analysis, Copper, Copper alloys, Copper compounds, Energy dispersive spectroscopy, Energy gap, Ferrite, Fourier transform infrared spectroscopy, Iron compounds, Magnetic materials, Magnetic properties, Mossbauer spectroscopy, Nanoparticles, Optical properties, Precipitation (chemical), Saturation magnetization, Scanning electron microscopy, Spectrum analysis; Diffuse reflectance spectroscopy, Energy dispersive X ray spectroscopy, Hexafferites, Hyperfine interactions, Magnetooptical properties, Optical characterization, Optical materials/properties, Vibrating sample magnetometer; Chromium compounds

Abstract
Spinel Mg1−yNiyFe2O4 (0.0 ≤ y ≤ 1.0) ferrite magnetic nanoparticles (MNPs) were synthesized by a sol-gel combustion method using urea as the reducing agent/fuel. Powder X-ray diffraction (XRD) analysis revealed the formation of cubic spinel Mg1−yNiyFe2O4 powders and confirmed pure crystalline phase and the average crystalline size of 21.25 to 17.04 nm. Functional group bonds between metal and oxygen (M–O) were confirmed by Fourier transform infrared (FT-IR) spectra. The microstructure of the powders was recorded by high-resolution scanning electron microscope (HR-SEM) and confirmed the particle-like surface morphology with smaller agglomeration, due to the magnetic interaction of the particles. Energy-dispersive X-ray (EDX) results showed the composition of the expected elements and confirmed the phase purity of the products. Vibrating sample magnetometer (VSM) technique recorded at room temperature was used to analyse the magnetic properties of the samples and the hysteresis loops showed the ferromagnetic behaviour. Moreover, the samples Mg1−yNiyFe2O4 NPs were tested for the photocatalytic degradation (PCD) of methylene blue (MB) dye and the sample y = 0.6 showed maximum degradation efficiency (96.83 %), due to the smaller particle size with higher surface area than other compositions. Furthermore, spinel Mg1−yNiyFe2O4 nano-photocatalysts can be reused several times without change of its catalytic activity. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Coir pith/nylon/epoxy hybrid composites and their thermal properties: Thermogravimetric analysis, thermal ageing, and heat deflection temperature

(2018) *Journal of Vinyl and Additive Technology*, 24 (4), pp. 297-303. Cited 3 times.

DOI: 10.1002/vnl.21594

Abstract
Thermal stability of composites and their constituents becomes an important criterion during their processing and application in different fields. The present work deals with the thermal stability of coir pith/nylon/epoxy hybrid composites by studying the thermogram, heat deflection temperature, and accelerated ageing of these composites. The effect of chemical treatment of coir pith and hybridization on these properties is dealt in detail in the discussion. The composite samples were prepared by hand layup method followed and by compression molding. Coir pith was subjected to different types of chemical treatments—sodium hydroxide, dicumyl peroxide, acrylic acid, acetic acid, sodium hypochlorite, and sulfuric acid before processing. Thermogravimetric analysis of composite samples showed improved thermal stability with treatment of coir pith and hybridization with nylon fabric. The effect of temperature on the ageing of composites was studied after an accelerated ageing process followed by a comparison of retention in impact strength. The thermogram of the samples was found to complement the results obtained in accelerated ageing and heat deflection analysis. J. VINYL ADDIT. TECHNOL., 24:297–303, 2018. © 2017 Society of Plastics Engineers. © 2017 Society of Plastics Engineers
