Abstract
In this work, WO3-TiO2, chitosan-blended WO3-TiO2, and garlic-loaded WO3-TiO2 nanocomposites were synthesized by the sol-gel and precipitation technique. The synthesized nanocomposites were characterized by XRD, FE-SEM, HR-TEM, EDX, UV-DRS, FT-IR, and TG-DTA analysis. The photocatalytic efficiency of the three synthesized nanocomposites on the degradation of dyes such as rhodamine B (Rh-B), methylene blue (MB), and methyl orange (MO) as organic pollutants was evaluated under solar light irradiation. The results show that garlic-loaded WO3-TiO2 nanocomposites act as an excellent photocatalyst than chitosan-blended WO3-TiO2 and WO3-TiO2 nanocomposites. Further, the antimicrobial activity of the synthesized nanocomposites was examined against Gram-negative bacteria (Escherichia coli) by the well diffusion method. Garlic-loaded WO3-doped TiO2 nanocomposites have demonstrated good antibacterial activity over chitosan-blended WO3-TiO2 nanocomposites and WO3-TiO2 nanocomposites. The possible reason may be the presence of organic sulfur compounds in garlic. © 2020 American Chemical Society.

Abstract
Chitosan, collagen, gelatin, polylactic acid and polyhydroxyalkanoates are notable examples of biopolymers, which are essentially bio-derived polymers produced by living cells. With the right techniques, these biological macromolecules can be exploited for nanotechnological advents, including for the fabrication of nanocarriers. In the world of nanotechnology, it is highly essential (and optimal) for nanocarriers to be biocompatible, biodegradable and non-toxic for safe in vivo applications, including for drug delivery, cancer immunotherapy, tissue engineering, gene delivery, photodynamic therapy and many more. The recent advancements in understanding nanotechnology and the physicochemical properties of biopolymers allows us to modify biological macromolecules and use them in a multitude of fields, most notably for clinical and therapeutic applications. By utilizing chitosan, collagen, gelatin, polylactic acid, polyhydroxyalkanoates and various other biopolymers as synthesis ingredients, the 'optimal' properties of a nanocarrier can easily be attained. With emphasis on the aforementioned biological macromolecules, this review presents the various biopolymers utilized for nanocarrier synthesis along with their specific synthetization methods. We further discussed on the characterization techniques and related applications for the synthesized nanocarriers. © 2020

Abstract
Polyaniline protected silver nanoparticles (Ag-doped PANI nanocomposites) were synthesized successfully by a solid-state mechano-chemical oxidative polymerization. AgNO3 acted as a metal precursor as well as an oxidizing agent. The prepared Ag-doped PANI nanocomposites were characterized by various techniques such as TEM, FE-SEM, XRD, FTIR and UV–vis spectroscopy. XRD confirmed the cubic FCC form of the Ag nanoparticles with an average crystal size of ~36.04 nm for the Ag-doped PANI nanocomposites. FE-SEM and TEM analysis of Ag-doped PANI nanocomposites revealed the formation of spherical as well as semi-spherical Ag nanoparticles embedded in the PANI polymer matrix. Cyclic voltammogram revealed excellent electrochemical responses and electrocatalytic behavior of the Ag-doped PANI nanocomposites/GCE for hydrogen peroxide (H2O2) and dopamine (DA). Based on cyclic, amperometric and differential pulse voltammetric analysis, it was found that H2O2 undergoes reduction whereas DA is oxidized at the surface of the modified Ag-doped PANI nanocomposites/GCE. For H2O2 and DA, the detection limits as measured from differential pulse voltammetric analysis were 0.03 μM and 0.12 μM, respectively. © 2020

Abstract
Tm-Tb co-substituted Co-Ni nanospinel ferrites (NSFs) as (Co0.5Ni0.5) [TmxTbxFe2−2x]O4 (x = 0.00–0.05) NSFs were attained via the ultrasound irradiation technique. The phase identification and morphologies of the NSFs were explored using X-rays diffraction (XRD), selected area electron diffraction (SAED), and transmission and scanning electronic microscopes (TEM and SEM). The magnetization measurements against the applied magnetic field (M-H) were made at 300 and 10 K with a vibrating sample magnetometer (VSM). The various prepared nanoparticles revealed a ferrimagnetic character at both 300 and 10 K. The saturation magnetization (Ms), the remanence (Mr), and magneton number (nB) were found to decrease upon the Tb-Tm substitution effect. On the other hand, the coercivity (Hc) was found to diminish with increasing x up to 0.03 and then begins to increase with further rising Tb-Tm content. The Hc values are in the range of 346.7–441.7 Oe at 300 K to 4044.4–5378.7 Oe at 10 K. The variations in magnetic parameters were described based on redistribution of cations, crystallites and/or grains size, canting effects, surface spins effects, super-exchange interaction strength, etc. The observed magnetic results indicated that the synthesized (Co0.5Ni0.5)[TmxTbxFe2−x]O4 NSFs could be considered as promising candidates to be used for room temperature magnetic applications and magnetic recording media. © 2020 by the authors. Abstract
SUMMARY: The pear-shaped bony orbit connects with intracranial cavity via foramina's and fissures. The Meningo-orbital Foramen(MOF) is usually present in greater wing of sphenoid close to lateral edge of Superior orbital fissure. It provides a route for an anastomosis between the orbital branch of the middle meningeal artery(MMA) and recurrent meningeal branch of Ophthalmic Artery(OA) and hence, risk of damage during surgeries can occur. To verify occurrence and location, with morphology of MOF in dry orbits and the impending clinical hazards in surgeries pertaining to the orbit, document and analysis it to determine a standardized guideline. The presence for MOF was studied in 446 dry orbits with its location from the supra orbital margin (SOM), front zygomatic suture (FZS), the lateral tubercle of Whitnall (WT)and the lateral end of superior orbital fissure(SOF) along with its patency, laterality and number of foramina's present. Nylon probes, long divider/pins, compass and Vernier callipers was used to check the patency and various parameters. The study noted the percentage prevalence of MOF as 69 % with communication with middle cranial fossa(MCF) being 76 % of 69 % and the average distance from SOM, FZS, WT and lateral end of SOF being 35.58 mm, 24.9 mm, 26.6 mm and 0.92 mm. On comparison with various population studies, certain similarities and differences with regards to different parameters were noted. Prevalence of MOF was mostly unilateral and showed multiple foramina, that can act as channels for arteries, a variant of MMA or OA, that supply orbital structures or tumour growths. Thus, awareness of this variation is of prime importance to ophthalmologists and neurosurgeons as well as interventional radiologists, in preventing haemorrhagic condition which could further raise the difficulties in operative procedures and surgical outcomes. © 2020, Universidad de la Frontera. Abstract

Epidemiological studies have proven that children mental health can be affected by environmental pollutants which are believed to be visible in the form of psychological disorder later in their childhood. Moreover, the effects of children mental health are evidently clear in the case of phthalates which have been observed to increase psychological disorder, specifically attention-deficit hyperactivity disorder (ADHD). Hence, the present study aims to conduct a systematic review and provide an overview of the existing literature on the association between urinary phthalate metabolite concentrations and ADHD symptoms among children by emphasizing the confounding factors and limitations. Additionally, this review addressed the possible phthalate mechanism insights in human body including its impact on ADHD symptoms. In this case, 16 epidemiological studies (five cross-sectional, nine cohort and two case control studies) that met all the inclusion criteria were selected out of the total of 427 papers screened to show varying quantitative associations between phthalate exposure and ADHD symptoms among children with confounding factors and limitations in the existing studies in regard to the exposure and outcomes. This review also attempted to present possible explanation on phthalate mechanism in children body and its connection on neurodevelopment and ADHD symptom development which remains unclear in most of the studies. Finally, it is highly recommended for further research to carefully design cohort studies from prenatal to later childhood development with a complete sample size in order to understand phthalate impacts on children health. © 2020, Springer-Verlag GmbH Germany, part of Springer Nature.

Abstract
In the present investigation, an innovative method was evolved for the synthesis of egg albumin doped Zinc oxide nanoparticles (Ea-ZnO NPs). The biophysical characterizations of Ea-ZnO NPs were assessed by UV–Vis., FT-IR, XRD, TEM and DLS analysis. UV spectrum exhibited a distinctive absorption peak at 310 nm. The synthesized Ea-ZnO NPs materialized as a spherical and hexagonal platelet-like structure with 20–60 nm in diameter through TEM. The anticancer and biocompatibility potential of Ea-ZnO NPs was evaluated against MCF-7 cancer cell line. Anticancer activity of Ea-ZnO NPs on MCF-7 by MTT assay having significant cytotoxicity and proportionately decreased cellular viability. Gene expression study (RT-PCR) and Western blot analysis indicated that the Ea-ZnO NPs stimulated ROS, which in turn up the regulated transcription of mRNA levels of apoptotic genes such as p53, bcl-2, caspase-3 and caspase-9 while significantly downregulated the expression of anti-apoptotic gene Bcl-2. The outcome deliberates that Ea-ZnO NPs can specifically repress the gene expression of MCF-7 by ROS damage and cytotoxicity intervened cell death. Overall, the Ea-ZnO NPs can be a potential drug for anticancer therapy. © 2020 Elsevier B.V.

Author Keywords
Anticancer activity; Drug development; Egg white (albumin); Protein expression; RT-PCR; ZnO nanoparticles

Index Keywords
antineoplastic agent, caspase 3, caspase 9, messenger RNA, ovalbumin, protein bcl 2, protein p53, reactive oxygen metabolite, zinc oxide nanoparticle; absorption, antineoplastic activity, apoptosis, Article, biocompatibility, cancer therapy, cell viability, drug delivery system, Fourier transform infrared spectroscopy, gene expression, human, human cell, MCF-7 cell line, mRNA expression level, MTT assay, real time polymerase chain reaction, synthesis, transmission electron microscopy, ultraviolet visible spectroscopy, upregulation, Western blotting, X ray diffraction

Chemicals/CAS
caspase 3, 169592-56-7; caspase 9, 180189-96-2; ovalbumin, 77466-29-6; protein bcl 2, 219306-68-0

Abstract

Non-stationary optical stimulus based infrared non-destructive testing modality has gained much attention from past decades. Various post processing techniques based on signal and image processing have been proposed for better visualization and quantification of subsurface defects for Non-Stationary Thermal Wave Imaging (NSTWD. In present work, a new post processing approach named fan chirp transform is adapted to perfectly match the chirp rate from sample thermal response to facilitate better visualization of defects. The merit of proposed method is compared with the conventional post processing methods like Fast Fourier Transform (FFT) phase, pulse compression (PC) and principle component analysis (PCA). By considering the parameter of merits such as signal to noise ratio of defective pixels and full width at half maxima for defect sizing. It is observed that the adapted Fan-Chirp transform provides better defect detection and better signal to noise ratios. © 2020 IEEE.

Abstract
This work reports the synthesis of silver nanoparticles (AgNPs) using aqueous extract of Plumbago auriculata, and evaluates their antibacterial and larvicidal activities. The synthesized silver nanoparticles were characterized by various spectroscopy techniques, such as FTIR, XRD, TEM, EDX, Zeta potential, and DLS. The synthesized AgNPs exhibited significant antibacterial activity against Gram-positive and Gram-negative bacteria, such as Bacillus subtilis, Staphylococcus aureus, Escherichia coli, and Klebsiella pneumoniae. Furthermore, synthesized nanoparticles inhibited the fourth instars larvae of Aedes aegypti and Culex quinquefasciatus at the concentration of 45.1 and 41.1 µg/mL respectively. Results of dose-dependent studies showed that synthesized nanoparticles were also effective at low concentrations. Molecular docking studies performed with the salivary protein and odorant-binding protein of Aedes aegypti and Culex quinquefasciatus demonstrated that the naphthoquinone compound plumbagin exhibited reliable binding affinity towards the two enzymes. The findings thus reveal that the plant extract and its nanoparticles can be a better alternative to available chemicals to control mosquitos. © 2020 by the authors. Abstract
This paper reports the correlation between the composition of the functional Sr0.5Ba0.5Sm0.02Fe11.98O19/x(Ni0.8Zn0.2Fe2O4) hard-soft nanocomposites (SrBaSmFe/x(NiZnFe) NCs), where 0.0 ≤ x ≤ 3.0, and their structural features, magnetic, and microwave properties. SrBaSmFe/x(NiZnFe) hard/soft ferrite NCs are produced using the one-pot citrate combustion method. According to the XRD analysis, all samples showed the co-existence of both SrBaSmFe and NiZnFe phases in different ratios. Magnetic properties are measured in a wide range of magnetic fields and temperatures (10 and 300 K) and correlated well with the composition of the investigated samples. The microwave properties (frequency dispersions of the magnetic permeability, and electrical permittivity) are discussed by using the co-axial method in the frequency range of 0.7-18 GHz. Non-linear dependences of the main microwave features were observed with varying of composition. The microwave behavior correlated well with the composite theory. These results could be used in practice for developing antenna materials. © 2020 by the authors.

Abstract
Herein, a novel approach is reported to design metallodielectric silica (SiO2) supported Turkevich silver nanoparticles (Ag NPs) for direct fabrication of SiO2/Ag nanocomposites (NCs). The technique utilizes electrostatic interaction of ex situ synthesized amine-functionalized positively-charged SiO2 NPs and citrate-capped negatively-charged Ag NPs. The formation of nanoparticles was confirmed using various analytical techniques and explored for photocatalytic degradation of methyl orange (MO) at ambient temperature under sunlight irradiation. SiO2/Ag-NCs showed significant degradation of MO (94.50% in 40 min) with an estimated apparent degradation rate of 6.9 ×10−2 min−1, can be attributed to efficient charge separation by Ag NPs decorated on SiO2 NPs. This strategy may offer innovative considerations for the design of photocatalyst/carrier nanocomposites. © 2020 Elsevier B.V.

Abstract
The correlation between blood glucose and breath acetone suggested by several studies has spurred the research community to develop an electronic (e-nose) for diabetes diagnosis. Herein, we have validated the in-house graphene based sensors with known acetone concentration. The sensor performances such as sensitivity, selectivity and stability (SSS) suggested their potential use in acquiring breath print. The 10% higher mean saturation voltage for 30 diabetic subjects ensured a discrimination accuracy of 65% with a positive correlation (r = 0.88) between biochemically measured and non-invasively estimated (glycated haemoglobin) HbA1c. For the improvement of classification rate, thirteen features associated with the adsorption kinetics were extracted from the breathprint from each of the three sensors. The features given as an input to the Naïve Bayes classification model fetched an accuracy of 68.33%. Elimination of redundant features by distinction index and one-R feature ranking algorithm results in Naïve Bayes algorithm with improved performances. The success rate has improved to 70% using the subset of features ranked by one-R algorithm. These results indicated the use of feature ranking algorithms and prediction models for the improvement in accuracy of our in-house fabricated graphene based sensors.

Abstract
Super pliancy is a reasonable method for framing complex-molded structures. The strategy has the benefits of convey in uncommon formability and possibly giving great dimensional tolerance. Stir casting method was effectively used to prepare the AA6063/SiCp composite and followed by rolling process was repeated until the sheet reduces to the required thickness of 2.5 mm. With the gas pressure forming the composites were tested for superplastic forming. Instantaneous change in heights were measured through LVDT (Linear Variable Differential Transformer). Gas pressure forming tests were conducted on various percentages of SiCp composites. The biaxial superplastic forming tests were conducted at various temperatures between 520°C to 600°C and pressures between 0.2 MPa to 0.7 MPa. At the temperature of 600°C and 0.7 MPa the cracks were formed and the components were deformed. © 2020 Author(s).

Abstract
Natural fibre-reinforced hybrid composites can be a better replacement for plastic materials. In the present study, natural materials like Bamboo fibre woven mat, Aloe Vera fibre Woven mat, and Sisal fibre are used with epoxy as resin. The Testing of composites in predominantly used to identify the material properties to use it in design, analysis and also to develop structural design allowable. The aim of this paper is to analyze the mechanical properties of bio hybrid composite, which are studied and compared and in order to quantify the characteristics of prepared bio degradable composite materials in various combinations, the tests like tensile, flexural, water absorption and Hardness are conducted and analysed. © 2020 Author(s).

Abstract
Diffusion bonding is one of the metal joining process to join same and well as dissimilar metals. In this project stainless steel and copper plates were joined together with the interlayer of cupronickel sheet. The temperature was maintained in the range of 800-850°C. At the same time of heating compression load also acting on the specimensupto 5 MPa. To prevent the oxidation process vacuum of 10-4 Torr was maintained. The experiment was conducted for 60 Min. distinct diffusion zones were formed in the joined area of the specimens. The experiments were conducted with different temperatures and pressure. The shear strength of the specimens was tested and at 825°C have maximum shear strength of 8.47KN. © 2020 Author(s).

Abstract
Extrusion is the important manufacturing process and many components have been manufactured. Extrusion load play the major role for that the selection of die angle. A pilot study has been conducted for selecting a suitable die design for the present work. The selection of the semidie angle has been determined for the die of inlet diameter 12 mm and outlet diameter 8 mm. Hot die steel (H-13) is used as the die material for this study. © 2020 Author(s).

Abstract
The chain drives are the primary systems used in order to transmit power, and act as the effective means of material handling. Chain conveyors ultimately experience tension due to wear. The tension generated on this conveyor setup needs to be supplanted, consequently would affect the efficiency and increases to perform such an important activity of an industry. Roller and chain transports are predominantly used in the mills where sugar, paper, fertilizer and cements are produced in large quantities. Such material handling systems are more reliable and appropriate in the metal casting industries in which the foundry practices and heat treatment processes are inevitable. This report discusses on the physical responses of the chain drive upon elastic loading and also contemplates on the internal resistances. Analysis on such experimentations brings in fruitful results and suggestions so as to minimize the constraints related to time and cost, to the aforesaid industries. © 2020 Author(s).

Abstract
Thermoresponsive surfaces enable the detachment of cells or cell sheets by decreasing the temperature of the surface when harvesting the cells. However, human pluripotent stem cells (hPSCs), such as embryonic stem cells and induced pluripotent stem cells, cannot be directly cultured on a thermoresponsive surface; hPSCs need a specific extracellular matrix to bind to the integrin receptors on their surfaces. We prepared a thermoresponsive surface by using poly(N-isopropylacrylamide-co-butylacrylate) and recombinant vitronectin to provide an optimal coating concentration for the hPSC culture. hPSCs can be cultured on the same thermoresponsive surface for 5 passages by partial detachment of the cells from the surface by decreasing the temperature for 30 min; then, the remaining hPSCs were subsequently cultured on the same dishes following the addition of new cultivation media. The detached cells, even after continual culture for five passages, showed high pluripotency, the ability to differentiate into cells derived from the 3 germ layers and the ability to undergo cardiac differentiation. © 2020

Abstract
The paper discusses a practical case of creating an autonomous microgrid for remote residential customers power supply. Due to the specifics of the geographic location, the main scenarious, considered within the framework of the study are : distribution network conncetion, creation of a diesel power plant, creation of an autonomous hybrid micro-grid based on wind power plants and energy storage. In the study, a load forecast has been made and a methodology for determining the installed capacity of the main generation sources is presented. According to the criteria of technological efficiency and environmental safety, the option of creating an autonomous microgrid was adopted for implementation. © 2020 IEEE.

Abstract
The paper describes the methodology for consideration of renewable energy sources in strategic plans of fuel and energy sector development. The inclusion of renewable energy projects in energy development programs is carried out based on the results of an integrated ranking of technical, economic and environmental criteria. For power generation facilities based on renewable energy sources, the energy potential is additionally addressed in accordance with the list of power generation technologies under consideration, which makes it possible to obtain the values of the installed capacity utilization factors, and, as a consequence, to judge on the technological and commercial feasibility of renewable energy projects implementation. The paper provides an example of a ranked list formulation of renewable energy projects for a real regional power system. © 2020 IEEE.

Abstract
This present study deals with the quantum computational analysis of palmitic-oleic-stearic acid based triglyceride molecule available in waste animal fat, which involves in transesterification reaction during biodiesel production. From stereospecific analysis, stearic acid, oleic acid and palmitic acid, and were found at SN1, SN2 and SN3 positions respectively. The proposed triglyceride model was developed using Gaussian 09 and computational analyses were carried out using Density functional theory (DFT) method. Based on geometric optimization, the average bond length between C-C bond, C=C bond, C-H bond, C-O bond and C=O bond was measured as 1.53Å, 1.33Å, 1.09Å, 1.43Å and 1.23Å respectively. Average dipole moment of the triglyceride molecule was measured as 1.3010 Debye while electronic dislocation was noted in X+Z direction. In addition, the overall molecular energy was found to be - 2522.7425 a.u. and optimization energy as -58.95 kJ/mol. Also, vibrational frequencies were analysed using the IR spectrum whereas electrostatic potential were mapped for the triglyceride molecule. © Published under licence by IOP Publishing Ltd.

Abstract
Plants are adundantly and are very promisive to be used as source of drugs in many diseases or infections and also it is a main agents of antioxidants which prevents the oxidative stress that are caused by the free radicals. There are numerous studies based on the pharmaceutical and classifiication of medicinal plants throughout the world. Leaves, fruits, roots are most frequently plant parts used in many research and studies. Here the present study was aimed to evaluate the in vitro antioxidant activity of aqueous and ethanol leaf extracts of Andrographis paniculata Nees and Rhinacanthus nasutus Kurz. Antioxidant is a substance which is used to prevent some types of cell damage in the body. Determination of their in vitro antioxidant activity were carried out by using methods such as DPPH (2,2-diphenyl-1picrylhydrazyl assay), ABTS (2,2′-azinobis (3-ethylbenzothiazolin 6-sulfonic acid assay), FRAP (ferric reducing antioxidant power assay) and SOD (super oxide anion scavenging) assay, H2O2 (hydrogen peroxide radical scavenging) assay. Moreover the ethanolic leaf extracts showed best antioxidant activity than the aqueous leaf extracts. Experimental results reveals that the leaves of A. paniculata have potent antioxidant and free radical scavenging activity than R. nasutus. Further investigation must be done for these two medicinal plants for the discovery of the bioactive compounds. © International Journal of Research in Pharmaceutical Sciences.

Author Keywords
ABTS; Andrographis paniculata Nees; Antioxidant; DPPH; FRAP; In vitro; Rhinacanthus nasutus Kurz; SOD

Index Keywords
1,1 diphenyl 2 picrylhydrazyl, 2,2' azinobis(3 ethylbenzothiazoline 6 sulfonic acid), Andrographis paniculata extract, ascorbic acid, ferric chloride, hydrogen peroxide, potassium ferricyanide, Rhinacanthus nasutus extract, superoxide dismutase, trichloroacetic acid, unclassified drug; antioxidant activity, Article, DPPH radical scavenging assay, ferric reducing antioxidant power assay, hydrogen peroxide scavenging assay, spectrophotometry, super oxide anion scavenging assay

Chemicals/CAS
1,1 diphenyl 2 picrylhydrazyl, 1898-66-4; 2,2' azinobis(3 ethylbenzothiazoline 6 sulfonic acid), 28752-68-3; ascorbic acid, 134-03-2, 15421-15-5, 50-81-7; ferric chloride, 7705-08-0; hydrogen peroxide, 7722-84-1; potassium ferricyanide, 13746-66-2; superoxide dismutase, 37294-21-6, 9016-01-7, 9054-89-1; trichloroacetic acid, 14357-05-2, 76-03-9

Abstract
Exposure to overwhelming stress could lead to development of mental dis-orders and worsening of existing ones. The impact produced by exposure to stress might be affected by the seriousness of the stressor, the time amid which it is connected (acute vs. chronic). In traditional practice of medicine, C. speciosus extract exhibits antistress action so we aimed to test whether this extract plays a vital role in maintaining the brain's chemical transmitters levels during acute noise stress conditions. The levels of Dopamine (DA), Nore-pinephrine (NE) and Serotonin (5HT) were analysed by reverse phase HPLC in cerebral cortex and hippocampus brain tissue of acute noise stress exposed, C. speciosus extract (250mg and 500mg) and fluoxetine treated rats. Nore-pinephrine and dopamine were found to be increased in contrast to 5-HT levels in stressed group of rats, whereas CSE 500 mg could alleviate the said alter-ation. This study highlights the importance of C. speciosus extract therapy to noise stress induced rats by testing the neurotransmitters levels in brain tissue to understand its therapeutic potential. © 2020 International Journal of Research in Pharmaceutical Sciences. Aromatic spice nutmeg attenuates memory deficits in rotenone model of parkinson's disease
(2020) *International Journal of Research in Pharmaceutical Sciences*, 11 (4), pp. 5441-5447. Cited 1 time.

Abstract
PD is a multifactorial neurodegenerative disorder with features such as tremor, rigidity, bradykinesia, postural instability, and dementia. Neuropathologically, selective loss or death of dopaminergic neurons is the hallmark of PD. In PD, elevated oxidative stress, mitochondrial dysfunction and neuroinflammation were reported. Rotenone (an isoflavone obtained from Fabaceae associated vegetation such as the jicama vine plant) induces oxidative stress, mitochondrial dysfunction, inflammation and apoptosis in cell line and animal models. It was useful in the evaluation of neuroprotective properties on cell line and animal models of PD. Drugs with anti-oxidant potential helped to control the cellular stress, free radical formation, neurotransmitter level in PD animal models. Nutmeg, an aromatic spice exhibited memory enhancing, anti-oxidant, anticonvulsant properties. It is an excellent body detoxifier and stimulator of the brain due to the presence of pharmacologically active compounds such as eugenol, isoelemicin, isoeugenol, methoxyeugenol, myristic acid, myristicin, saponins and lignin. Macelignan (a compound present in nutmeg) having the low molecular weight and hydrophobic nature could pass beyond the blood-brain barrier. In this study, we explored the cognitive profile of rotenone-induced model of PD treated with MFSE extract (MFSE) by behavioural tests (Morris water maze test, T-maze test and Elevated plus maze Test). Rotenone was injected to male Wistar albino rats by intraperitoneal route (2.5mg/kg daily) for 30days. MFSE treated rats showed significant improvement in cognition in rotenone-induced PD model. It might be due to its neuroprotective and anti-cholinesterase properties. © 2020 Global Research Online. All rights reserved.

Abstract
Mathan Thylam is a medicated oil which is widely used as a topical medicine. In native of Siddha system, this oil is prescribed to heal all types of ulcers and wounds. It is very effective in curing severe carbuncle ulcer of diabetes, diabetic foot ulcers. The oil has a wide variety of other therapeutic topical applications such as eczema, bedsores itches, weeping eczema, wounds, fol-liculitis, anal fistula, ear infections, per anal abscess, alopecia, non-healing of cut and burns wounds. The vital compositions of the mathan thylam are con-stituted with thurusu (copper sulphate), datura leaf and coconut oil. These active ingredients, present in mathan thylam acts to play a major role in healing ulcers. In this study, we aimed to prove the analgesic effect of mathan thylam. As a result of the presence of datura leaf, mathan thylam can be used as an unsurpassed analgesic than any other medicated oils. This oil is used to reduce pain as well as inflammation. The Phytochemical and GCMS analysis of a hydroalcoholic extract of the mathan thylam revealed the presence of coumarin, steroid, alkaloid, saponin, furan, quinine and triterpenoid. This comprehensive review includes information on botany, phytochemistry, pharmacology and ethnomedical uses of datura, which is the key ingredient in mathan thylam to be used as a topical analgesic. © 2020 International Journal of Research in Pharmaceutical Sciences.

Abstract
The foods from plants were known to ensure against degenerative diseases and maturing because of their antioxidant activity credited to their high polyphenolic content. Information on antioxidant activity of Indian medicinal plant is abundant. To the best of our knowledge, biological properties have not been accounted in the literature for this species of Ehretia. As a point, this is the first results to assess the anti-oxidant activity of the plant Ehre-tia pubescens Benth which belongs to the family Ehretiaceae. The antioxi-dant activity of Methanol, Hexane, Ethyl acetate and Aqueous extracts of E. Pubescens was determined using the DPPH free radical scavenging activity, ABTS radical scavenging activity and reducing power assay. The DPPH scavenging activity showed higher activity observed in methanolic extract (63%) of E.pubescens than ethylacetate (54%), hexane (44%) and aqueous (30%). Similarly the ABTS assay showed highest inhibition in methanolic extract (58%) than ethylacetate (43%), hexane (38%) and aqueous (32%) extracts. The reducing power assay of different extracts was increased in methanolic extract (54%) than ethylacetate (40%), hexane (34%) and aqueous (28%) extracts. Overall, the methanolic and ethyl acetate extract had higher antioxi-dant properties than other extract. However, in this study, Ehretia Pubescens Benth extracts exhibit great potential for antioxidant activity and may be useful for their nutritional and medicinal functions. © International Journal of Research in Pharmaceutical Sciences.

Abstract
This article highlights the industry experience of the development and practical implementation of a short-term photovoltaic forecasting system based on machine learning methods for a real industry-scale photovoltaic power plant implemented in a Russian power system using remote data acquisition. One of the goals of the study is to improve photovoltaic power plants generation forecasting accuracy based on open-source meteorological data, which is provided in regular weather forecasts. In order to improve the robustness of the system in terms of the forecasting accuracy, we apply newly derived feature introduction, a factor obtained as a result of feature engineering procedure, characterizing the relationship between photovoltaic power plant energy production and solar irradiation on a horizontal surface, thus taking into account the impacts of atmospheric and electrical nature. The article scrutinizes the application of different machine learning algorithms, including Random Forest regressor, Gradient Boosting Regressor, Linear Regression and Decision Trees regression, to the remotely obtained data. As a result of the application of the aforementioned approaches together with hyperparameters, tuning and pipelining of the algorithms, the optimal structure, parameters and the application sphere of different regressors were identified for various testing samples. The mathematical model developed within the framework of the study gave us the opportunity to provide robust photovoltaic energy forecasting results with mean accuracy over 92% for mostly-sunny sample days and over 83% for mostly cloudy days with different types of precipitation. © 2020 by the authors. Abstract
Estimation of stature plays a major role in the field of Forensic Medicine and anthropometry especially helps in establishing the identity of an individual from mutilated, decomposed and amputated body parts. In our study, stature was estimated from the percutaneous length of ulna. Study sample consisted of 96 adult males and 66 adult females between the age group of 18-22 years, born and brought up in Chennai. The length of the of the right and left ulna was measured with a vernier caliper from the tip of the olecranon to the styloid process and the height of the individual was measured with a calibrated stadiometer. The measurements were noted in the proforma. The data was statistically analyzed and linear regression formulae were derived. © 2020, Institute of Medico-Legal Publications. All rights reserved.

Abstract
As dentists, we must disinfect and clean all equipments and countertops between patients with a recommended hospital-grade bactericidal product. Nonvisible blood and saliva does not mean it is absent on environmental surfaces. Blood and saliva are present throughout dental treatment. If a patient becomes ill as a result of an exposure to a pathogen or a bacterium that is later found in our dental office surfaces, the employer and or dentist is at risk of being responsible for the patient's illness and associated compensatory damages. Understanding and recognizing the risk of disease will drastically reduce patient illness, practice liability and employee illnesses. Dentists cannot pretend that this is only a theoretical problem. Therefore the dental community needs to stay updated of the rapidly evolving standard of care and do its best to comply with the standard of care in daily practice. © 2020, Institute of Medico-Legal Publications. Abstract
Siloranes are a class of composites introduced in dentistry, introduced by Weinmann et al in 2005. The term silorane is derived from siloxane and oxirane. The combined form of these two chemical compounds forms siloranes, which are biocompatible and hydrophobic in nature. The polymerization mechanism of silorane composites is described as a cationic ring opening polymerization reaction that causes opening and expansion of the polymeric chain. This reduces the volumetric shrinkage when compared to methacrylate based composites. This article highlights the composition and properties of silorane composites. © 2020, Institute of Medico-Legal Publications. All rights reserved.

Goethite nanofibers as bio-fillers in dental composite resin

(2020) *Indian Journal of Forensic Medicine and Toxicology*, 14 (4), pp. 1488-1491.

DOI: 10.37506/ijfmt.v14i4.11750

Abstract
Composite resins represent an important member of biomaterials family that have been evolving due to the needs in biocompatibility and mechanical properties. Fillers in a variety of forms and types have been evaluated and the impact of fillers to improve the performance of the dental composites have been studied in vast. Various composite resin fillers tested had revealed its own strengths and weaknesses. Bio polymers when they are reinforced with biofillers can produce novel biocomposites. The biocomposites with the biofillers will replace and be a substitute for synthetic fibre-reinforced composites. In recent years, natural bio-fibres have gained attention as suitable reinforcements in polymeric matrices. These bio-fillers possess high specific strength and can be effectively used for dental composites resin. The most commonly occurring natural bio-fibres are the teeth of limpets. The teeth of limpets have a distinctive composite nanostructure which comprises of high-volume fractions of reinforcing goethite nanofibers to provide mechanical integrity. The limpet tooth is effective at resisting failure to abrasion. The goethite nanofibers are expected to be significant for novel dental biomaterials with extreme strength and hardness. © 2020, Institute of Medico-Legal Publications. All rights reserved.

Abstract
Haematoxylin is the most popular nuclear counterstain used in routine histopathogical techniques for staining tissues. It is derived from the tree Haematoxylum Campechianum (H.campechianum). The history of haematoxylin reveals centuries of war, strife and discovery dating from the Mayans and Aztecs who used it as an ink and fabric dye to the war resulting in the invasion of Mexico by European countries. H.campechianum was later named as logwood and block wood by the invaders that used it to generate haematoxylin crystals to be utilized in textile industry. The recognition to introduce haematoxylin as biological stain goes to Waldeyer. But later Bohmer introduced the technique of coupling a mordant to the dye making it colorfast and thus, haematoxylin remains a very unique and vital stain in histology till date. © 2020, Institute of Medico-Legal Publications. Knowledge and attitude of pediatricians with regard to emergency management of dental avulsion-a survey
(2020) *Indian Journal of Forensic Medicine and Toxicology*, 14 (4), pp. 1166-1172.

DOI: 10.37506/ijfmt.v14i4.11678

Abstract
Dental trauma is a very significant problem encountered in both primary and the permanent dentition.In preschool children the trauma rate is as high as 18% of all injuries. Among all facial injuries, dental injuries are the most common of which avulsions occur in 1–16% of all dental injuries. Among dental traumatic injuries, avulsion results in major functional and esthetic disturbances for patients. Epidemiological studies revealed that children from 8 to 12 years often suffer a dental injury.The teeth most commonly avulsed in both the primary and the permanent dentition are the maxillary central and lateral incisors. The longer the avulsed tooth is out of its socket, the less likely it will remain in a healthy functional state after replantation. The prognosis of replanted permanent teeth depends primarily on (i) prompt and appropriate first care, commonly provided by non-health professionals at the site of the accident, (ii) the storage media of the avulsed tooth prior to replantation, and (iii) the viability of periodontal ligament remnants on the root surface. Research has shown that immediate replantation is the best and most appropriate treatment for the traumatically avulsed permanent teeth. The aim of this study is to assess the basic knowledge of dental trauma and its management among pediatricians. © 2020, Institute of Medico-Legal Publications. All rights reserved.

Abstract
Dentigerous cyst is the second most common cyst. It is usually associated with the impacted third molars, canines and premolars. Clinically they present with asymptomatic swelling, bony expansion and radiographically they are well defined and the larger cyst leads to destruction of bone later leading to pathological fracture. They are chances where this cyst can be misdiagnosed when seen only clinically withan infected tooth. Radiographic investigation is the gold standard in diagnosing the lesion and its extent for treatment planning. The protein content of the cyst fluid also helps in the diagnosis. Here is a case where the patient complained of a decayed tooth along with swelling in the left side of face and how the diagnosis changed after proper history and radiographic investigation. © 2020, Institute of Medico-Legal Publications. Abstract
Aloevera has been in used by humans since times immemorial. Its health benefits are well known. Ancient Greeks and Egyptians used it in their daily routine and in battle fields due to its many miraculous properties. Studies have proved the antiseptic, anti-inflammatory, anti-viral, anti-fungal and wound healing properties of aloe vera plant. Recently it has garnered a lot of interest regarding its use in dentistry as it is completely natural and there are no side effects reported with proper usage. This paper gives an overview of the uses of this wonder plant in various departments of dentistry. © 2020, Institute of Medico-Legal Publications. All rights reserved.

Abstract
Nutrigenomics is an emerging form of science involving tools that assess the benefit of diet and nutrition in various disease conditions at molecular and genetic level. Nutrigenomics investigates the relationship of nutrient regimen in maintaining health. This article reviews the role of nutrients in maintaining periodontal health and the use of nutrigenomics in understanding genotype, phenotype diet interactions on periodontal health of an individual and the effect of dietary modification on periodontal disease progression. © 2020, Institute of Medico-Legal Publications. Abstract
Bio-Medical Waste (BMW) is a global concern. In common parlance BMW means any waste generated in the process of diagnosis, treatment, immunization and research related to human beings and animals. Due to improper or poor waste management practicesa huge risk is posed to the health of public, patients, professionals and also cause environmental disturbance. The Union Ministry of Environment and Forests under the provision of Environment [protection] act, 1986 which brought the focus back on this issue. These rules apply to all the people who are connected to generation, collection, receiving, storage, transportation and handling or biomedical waste in any form. This article aims to highlight the categories, segregation and management protocols by various government and non-government organizations and spread knowledge about the same. © 2020, Institute of Medico-Legal Publications. Abstract
A non-malignant lesion of cutaneous and subcutaneous tissue known as Papillary Endothelial Hyperplasia (PEH) is of rare occurrence. It is still more uncommon in the breast tissue. Often it is wrongly diagnosed as angiosarcoma. The differentiating features are papillary endothelial hyperplasia existing in an organized thrombus and absence of significant cell atypia (1). Three cases of PEH are discussed in patients treated by radiation therapy for breast carcinoma. © 2020, Advanced Scientific Research. All rights reserved.

Abstract
In the present work, non-toxic luminescent ZnO nanoparticles (NPs) and magnetic Fe3O4 NPs were separately prepared by co-precipitation method. In order to get the ZnO@Fe3O4 nanocomposite (NCs), both these NPs were embedded in silica matrix. Powder XRD reveals that the formation hexagonal wurzite structure of ZnO and cubic inverse spinel structure of Fe3O4. Both phases were combined in the prepared ZnO@Fe3O4 NCs. FT-IR spectra showed the absorption peaks confirmed the presence of metal-oxygen stretching bands in ZnO NPs, Fe3O4 NPs and ZnO@Fe3O4 NCs samples. VSM results showed both magnetite and ZnO@Fe3O4 have superparamagnetic, whereas the saturation value for ZnO@Fe3O4 NCs was tremendously decreased. Photoluminescence (PL) spectra of ZnO and ZnO@Fe3O4 illustrated that both samples have very good luminescence property. PL intensity of ZnO@Fe3O4 NCs has been reduced as compared to the intensity of bare ZnO NPs. However, ZnO@Fe3O4 still hold very good luminescence property. The as-prepared ZnO@Fe3O4 NCs were successfully demonstrated for magnetic resonance imaging contrast agent application. Hence, it can be simultaneously used for MRI contrast agent as well as optical imaging applications. © 2020 Elsevier B.V.

Abstract
A versatile, optically active, metal organic frame work, Catena-((μ4-dihydrogen oxalate)-bis(μ3-hydrogen oxalato)-(μ2-dihydrogen oxalate)-tetra-aqua-di-rubidium) {Rb(HC2O4)(H2C2O4)(H2O)2}1∞ (CDBDTR), was grown by the process of slow evaporation using water as the solvent. Single XRD showed that the crystal belongs to the triclinic crystal system with the space group P1. The assigned vibrational frequencies of the compound were identified by the FTIR and FT-Raman techniques. The UV–Vis spectrum revealed the cut off wavelength of the crystal to be 233 nm, and due to this low cut off, it occupies a place in optoelectronic devices. Using the UV-spectra, several optical constants were assessed. The surface morphology was studied using HR-SEM analysis. Energy dispersive X-ray analysis (EDXA) confirmed the presence of rubidium in the crystal. The thermal stability of the crystal was investigated using TG/DTA analysis. The dielectric response of the grown crystal has been thoroughly analysed. A photoluminescence study showed that the crystal has a high degree of luminescence, and its single peak emission affirms its highly ordered crystalline nature. The life time was also analysed. The crystal offers adequate resistance to laser radiation with a threshold value of 4.78 GW/cm2. By the Kurtz–Perry technique, the second harmonic generation of the crystal was assessed. The third order nonlinearity was explored using the Z-Scan technique. The figures of merit W and T were calculated in order to find the aptness of the crystal as a promising candidate for optical switching and optical limiting applications. © 2019 The Physical Society of the Republic of China (Taiwan)

Funding details
Indian Institute of Technology MadrasIITM

The authors acknowledge SAIF, IIT Madras for providing single crystal XRD, FTIR, FT-Raman, SEM, EDXA and thermal analysis measurements. Also the facilities of the Department of Physics, St. Joseph College, Trichy which provided the UV measurements are gratefully acknowledged. The authors are sincerely thankful for the facilities extended by the Department of Physics and Chemistry of B.S. Abdur Rahman University for providing the SHG facility, Laser damage threshold and Loyola College, Chennai for providing the dielectric facilities.

Abstract
This paper investigates the effect of glass fibre orientation on the impact damage evolution and post-impact residual strength of glass/epoxy laminates, using mechanical and acoustic emission (AE) analysis. The glass fibre reinforced polymer (GFRP) composite laminates with stacking sequence such as 0°, 90°, [±45°] and [0°/90°] were tested. The indentation-induced damage behaviour was examined in GFRP composite laminates by conducting drop weight impact and quasi-static indentation (QSI) tests to induce barely visible impact damage (BVID). Both tests provided essentially the same results for damage modes, dent depth, back surface crack size and load-deflection history. Mechanical parameters such as peak force, incident energy, absorbed energy, rebound energy and linear stiffness were used for the quantification of the indentation response. The AE parameters, such as amplitude, rise time, counts and energy were considered for monitoring damage progression during QSI loading. Also, other parameters linked to AE monitoring, such as the rise angle (RA), Felicity ratio (FR) and sentry function (SF) were measured for evaluating damage progression in each cycle of indentation. These results showed the [±45°] laminates having higher indentation damage resistance compared to other fibre orientation, whereas residual compressive strength was high for 0° laminates. © 2019 Informa UK Limited, trading as Taylor & Francis Group.

Abstract
This work focuses on the investigation of flexural strength in glass fiber reinforced (GFRP) composite laminates. Composite laminates with stacking sequence of [0°/90°]14 were fabricated by hand lay-up technique. Laminates with pre-induced defects were introduced through fibre cut in the 7th layer and the delamination between the 7th and 8th layers. Totally thirty five specimens with ASTM D 790-02 were cut from the fabricated laminates by using water jet cutting. In each case, seven specimens were considered from the fiber cut, delamination, virgin and impact for conducting flexural test with acoustic emission (AE) monitoring. AE response via events, counts, duration and amplitude were obtained for different categories of specimens under flexural loading. A standard probability distribution (Weibull distribution) was fitted to the obtained curves from the tested specimens of each case. The probability density function contained different statistical parameters (α, β) for different cases of specimens. An empirical model was developed for predicting the failure load using regression analysis. © 2020 Author(s).

Abstract
The reduced graphene oxide (RGO) sheets (1–4 wt %) containing ZnO hexagonal hollow rods (GZC) nanocomposites were fabricated via sonochemical method. The synthesized composites were characterized using Fourier transform-infrared spectroscopy (FT-IR), X-ray diffraction (XRD), UV-vis diffuse reflectance spectroscopy (UV-vis-DRS), Raman spectroscopy, thermo gravimetric analysis (TGA), field-emission scanning electron microscopy (FE-SEM), energy dispersive analysis of X-rays (EDX), high resolution transmission electron microscopy (HRTEM) and electrochemical impedance spectroscopy. The formation of hexagonal hollow ZnO rod was discussed with growth mechanism and their morphology was confirmed with FESEM and HRTEM analysis. The visible light driven photocatalytic activity of pure ZnO and an incorporation of varying weight percentages of GO into ZnO catalyst (GZC) were evaluated by using the methyl orange (MO) and methylene blue (MB) aqueous dye solutions as model organic pollutants. Among the developed nanocomposites, 3 wt% GZC nanocomposites possesses the highest degradation efficiency, that is, 90.72, 89.72% at 180, 240 min for MB and MO respectively with enhanced visible light absorption range. © 2020 Elsevier B.V.

Abstract
In recent years, cerium oxide has been the most widely studied photocatalyst due to its unique properties. However, bare CeO2shows poor photocatalytic performance under visible-light irradiation because it absorbs only UV light that leads to fast recombination of photogenerated electron-hole pairs. Therefore, surface modification can be one of the effective strategies to improve the visible-light absorption and reduce the recombination rate of photogenerated charge carriers. Herein, a series of CeO2/polydopamine (CeO2@PDA) composites were successfully fabricated by the polymerization of dopamine on the surface of CeO2. Our results demonstrated that the surface modification of CeO2by a small amount of PDA could effectively inhibit the photocatalytic reaction; this not only promoted the photoelectron injection and reduced the charge recombination rate, but also controlled the overgrowth of Pt cocatalyst. As compared to bare CeO2, CeO2@PDA shows remarkable photocatalytic hydrogen production performance. This composite also presents good durability and stability for the photocatalytic hydrogen production reaction. Thus, this study provides a new insight into the preparation of CeO2composites with effective solar energy conversion. © The Royal Society of Chemistry and the Centre National de la Recherche Scientifique 2020.

Abstract
Air pollution is one of the greatest environmental evils. The Multi-Plume industrial source complex Short-term Period Regulatory (MPC-SPR) model is an alternate model to EPA and it is exclusively developed for regulatory purposes in India. The MPC-SPR model is based on a Gaussian Plume dispersion model from continuous elevated point sources. The processes as considered in the models are similar to ISCST3. The data requirements for dispersion analysis consist of three important parts: the emission inventory, the meteorological data and the monitoring data. A detailed emission inventory has been prepared by gathering data such as stack height, stack diameter, stack temperature, velocity, and rate of discharge of SO2 from the industries. Emission inventory has been Neyveli prepared data gathered from CARD such as stack coordinate, stack height, exit stack diameter and emission rate of SO2. The Meteorological data such as wind speed and Wind direction were observed from the Meteorological observatory at Vadalur. The hourly meteorological file to the MPC-SPR models have been prepared, which is similar to that of the ISCST3 model. The MPC-SPR Model was used to simulate the dispersion pattern of SO2 in the month of January 2019 by considering the emission from all the industrial stacks situated within the study area. © 2020 Author(s).

Abstract
Background: Oral pathologists are involved in laboratory diagnosis and receive specimens of biopsy, oral cytologic smears and samples for hematology, biochemistry and microbiology and thus are at a risk for laboratory-acquired infections, which may occur inadvertently and can be considered as an occupational hazard. Aim and Objectives: This study was conducted during the coronavirus disease (COVID-19) pandemic to assess the knowledge of oral pathologists and oral pathology postgraduate students regarding the safe laboratory practices, procedures and guidelines. Materials and Methods: The study was a cross-sectional online questionnaire-based study. Questions were framed to evaluate the knowledge on specimen/sample collection, its handling, disposal and protective measures for laboratory personnel. The study population comprised oral pathologists and oral pathology postgraduate students of various dental colleges in India. A Google Doc format was used to create an effective computerized questionnaire system, and the link was forwarded to around 500 participants. The survey was fielded online between August 29, 2020, and September 5, 2020. Three hundred and twelve responses were received, which were downloaded as spreadsheets for subsequent data analysis. Results: Mean value of right answers for the oral pathologists was 8.11 ± 2.02 and for postgraduate students was 7.38 ± 1.75. When the knowledge score between the two groups was compared, a statistically significant difference was found. Conclusion: This article compares and highlights the knowledge lacunae among the oral pathologists and oral pathologists postgraduate students in relation to guidelines to be followed for safety in the laboratory. Adhering to these biosafety regulations reduces occupational health hazards and enhances a safe working environment in the laboratory. © 2020 Wolters Kluwer Medknow Publications. Citrus Extract Modified Graphene Oxide as a Green and Heterogeneous Organocatalyst for the Synthesis of Imidazole Derivatives

(2020) *Asian Journal of Chemistry*, 32 (9), pp. 2375-2380.

DOI: 10.14233/ajchem.2020.22578

Abstract
A naturally benign convention was created with a surface change of graphene oxide by citrus extract as catalyst was prepared by a straight-forward chemical modification method. The prepared catalyst's catalytic activity was examined by the synthesis of imidazole derivatives at room temperature. It shows a strong acidic catalytic and sustainable organocatalyst. The prepared catalyst was characterized using different analytical procedures like elemental analysis, Fourier transforms infrared spectroscopy (FT-IR), powder X-ray diffraction (PXRD), energy-dispersive X-ray analysis (EDS), scanning electron microscopy images (SEM) and transmission electron microscopy images (TEM) analysis. The catalytic activity shows high activity and can be reused without significant loss of catalytic activity after five times. A present catalyst works easily under room temperature. © 2020 Chemical Publishing Co.. All rights reserved.

Abstract
Single crystal of oxalato-bridged, Cesium-extended frame work, Cesium Hydrogen Oxalate Dihydrate (CHOD), has been synthesized by slow evaporation solution growth technique. Diffraction studies were used to identify the geometry of the atoms present in the primitive cell of the crystal. The title compound has crystallized in triclinic category-bearing space group P-1. Spectroscopic investigation of the compound was done by FTIR and FT-Raman techniques. From UV–Vis studies, optical absorption edge was ascertained as 241 nm. It has excellent optical transmission window throughout the visible region. Energy dispersive X-ray analysis (EDAX) affirms the presence of Cesium in the compound. Fluorescence decay of the molecules present in the excited state for the crystal was studied. Hirshfield surface maps intermolecular contacts present in the crystal and the contributions made by the contacts were assessed by 2D Finger print plots. Z-Scan studies ascertain the magnitude of nonlinear refractive index and nonlinear refraction. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
Novel premises of ‘Green Nanotechnology’ have tremendous impacts towards industrial scale revolution. The furtive extracted from natural precursors have driven to the generation of biogenic resources for the fabrication of cutting-edge nanomaterials in simple and cost-effective process. This inspection is an intension of the coupling hypothesis of Nanotechnology via ‘Green-Chemistry’ avenue. So, as to diminish the negative effects of technological applications in the health of human beings and the environment, society is focused towards a greener future. Nanoscience assures a promising future by its improvement in green chemistry to develop the 'Greenary Nanoscience and Nanotechnology'. The improvement and execution of chemical assisted processes in order to reduce the usage of harmful substances, the ‘Green Chemistry’ approach is one and only remarkable authentication, which attributed to long range surface area and higher pore volume of gold-nanoparticles. As of now, the efficient biogenic mechanism dramatically reduces the utilization and hazardous reagents have been employed to low-price natural and waste products to yield value-added nanomaterials with extensive relevance, suggesting an economical and green solution to environmental issues. In depth investigation of this critical review illustrates, novel biogenic screening platform was also conducted against antimicrobial strains and degradation of gold-nanoparticles products well explored-from selection precursors evolved from natural extracts, as well as eventually disintegration into bio-degradable yet potentially recyclable byproducts. © 2020 Elsevier Ltd

Author Keywords
Au nanoparticles; Functional organic products; Green nanotechnology; Nanomaterials

Index Keywords
Biohazards, Cost effectiveness, Degradation, Disintegration, Fiber optic sensors, Gold nanoparticles, Metal nanoparticles, Nanoscience, Nanostructured materials; Environmental issues, Green chemistry approaches, Green nanotechnologies, Harmful substances, Hazardous reagents, Nanoscience and nanotechnologies, Natural extracts, Technological applications; Green manufacturing

Funding details
Wuhan UniversityWHU

The author Dr. Kaushik Pal is grateful to Chinese Academy of Science Foundation (CAS) as well as Wuhan University, China. Special wish to doctoral research scholars at University Federal of Rio de Janeiro, Brazil for consistent support from LaBioS Centro de Tecnologia and Laborat?rio de Biopol?meros and e-Sensores. Especially, Dr. Pal, owe to his sincere and cordial thanks to associate colleagues and Scientific Instrument Operators also gratefully acknowledged for providing excellence of the research foundation.

Abstract
The l-arginium adipate (LAA) single crystal, is an organic component material efficiently grown by a simple technique called slow evaporation solution technique at ambient temperature. The monoclinic crystal system with the space group of P21 is exhibited for LAA from the X-ray diffraction analysis. FTIR spectroscopy that designates different molecular vibrations existing in LAA crystal was studied. The absorbance spectrum from the UV profile proclaims very less cut-off wavelength down to 206 nm and its wide optical band gap is also calculated. The perfection of the crystal is shown from Urbach's energy determination. The extent of polarization phenomena was examined for selected temperatures at dissimilar frequencies from the dielectric studies. The double harmonic output and triple-order nonlinear response for LAA are inspected from Kurtz-Perry and Z-scan technique, respectively. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
Non-stationary thermal wave imaging is emerging as a reliable alternative procedure due to its depth scanning and defect detection capabilities to assess the integrity of the materials. This investigation proposes a Decision Tree based anomaly detection in Barker Coded Thermal Wave Imaging (BCTWI). It facilitates automatic detection and visualization of anomalies with better spatial accuracy in a single view to help even an inexperienced personnel to easily assess subsurface features.

Abstract
[Ni(dtc)2] (dtc = N-(pyrrole-2-ylmethyl)-N-thiophenemethyldithiocarbamate (1), N-methylferrocenyl-N-(2-phenylethyl)dithiocarbamate (2), N-furfuryl-N-methylferrocenyldithiocarbamate (3), and (N-[pyrrole-2-ylmethyl]-N-thiophenemethyldithiocarbamato-S,S′)(thiocyanato-N)(triphenylphosphine)nickel(II) (4) complexes were prepared and characterized by elemental analysis, infrared, ultraviolet–visible, and nuclear magnetic resonance (1H and 13C) spectroscopies. The data were consistent with the formation of square planar nickel(II) complexes, which was confirmed by single-crystal X-ray diffraction studies on 2 and 4. Fe···Fe interactions exhibited by complex 2 led to supramolecular aggregation. The structure of 4 reveals intermolecular and intramolecular C-H···Ni anagostic interactions. The anion-sensing properties of 2 were studied with halide ions by cyclic voltammetry. It was observed that 2 acts as sensor for bromide. Complexes 1, 2, and 3, were utilized to prepare nickel sulfide, nickel–iron sulfide-1, and nickel–iron sulfide-2, respectively. The composition, structure, morphology, and optical properties of nickel sulfide and nickel–iron sulfides were examined using powder X-ray diffraction, transmission electron microscopy, energy-dispersive X-ray spectroscopy, ultraviolet–visible, fluorescence, and infrared spectroscopy. Powder X-ray diffraction patterns of nickel sulfide, nickel–iron sulfide-1, and nickel–iron sulfide-2 indicate the formation of orthorhombic Ni9S8, cubic NiFeS2, and cubic Ni2FeS4, respectively. The photocatalytic activities of as-prepared nickel sulfide and nickel–iron sulfide-1 nanoparticles were investigated for photodegradation of methylene blue and rhodamine-B under ultraviolet irradiation. Nickel–iron sulfide-1 nanoparticles show slightly higher photodegradation efficiency compared with the nickel sulfide nanoparticles. © 2020 John Wiley & Sons, Ltd.

Abstract
This work relates to the investigation of indentation induced damage resistance in glass fiber reinforced polymer composite laminates under normal and inclined planes. Uni-directional [0] and cross-ply [0/90] glass fiber reinforced polymer composite specimens were subjected to 0° and 20° indentation loading with acoustic emission monitoring. The specimens were loaded at the centre using a hemispherical steel indenter with 12.7 mm diameter. Mechanical responses such as force–displacement behavior, absorbed energy and resulting damage area were used for the quantification of the indentation damage. Acoustic responses such as normalized cumulative counts, energy, duration and peak frequency were considered for monitoring damage progression during 0° and 20° indentation loading. The residual compressive strength of the glass fiber reinforced polymer specimens following indentation was measured by testing them under in-plane loading, once again with acoustic emission monitoring. The correlation between mechanical and acoustic strain energy was used for the evaluation of the damage severity of the laminates. The result revealed indentation damage resistance in cross-ply laminates as 65.08% and 68.01% higher than uni-directional laminates for 0°, whereas for 20°, there was a reduction in the damage resistance in cross-ply laminates to 43.27% and 57.39%. These were higher than uni-directional laminates under the displacements of 2 mm and 3 mm, respectively. The conclusion from these results was that transverse shear load at 20° inclination of laminate leads to reduction in residual compressive strength. Moreover, uni-directional glass/epoxy laminates have better residual compressive strength than cross-ply laminates for both 2 mm and 3 mm indentation displacements. © The Author(s) 2020.

Living Donor Liver Transplantation Following Transcatheter Aortic Valve Implantation for Aortic Valvular Disease
(2020) *Seminars in Cardiothoracic and Vascular Anesthesia*, 24 (3), pp. 273-278. Cited 3 times.

DOI: 10.1177/1089253219887162

Abstract
Over the last few decades, outcomes with living donor liver transplantation (LDLT) have improved significantly. This has resulted in patients who were denied liver transplantation previously, due to various comorbidities and high risk, now being considered for LDLT. This includes patients with severe valvular heart disease such as aortic stenosis. These patients require aortic valve replacement to help cope with significant perioperative hemodynamic changes. High-risk cardiac procedures like aortic valve replacement are associated with serious perioperative morbidity and mortality in patients with end-stage liver disease. Since the advent of transcatheter aortic valve implantation (TAVI) in 2002, there have been a few case reports of its successful use prior to deceased donor liver transplantation, but there is no literature on this procedure before LDLT. In this article, we report our experience with 2 patients, the first patient with infective endocarditis-induced acute aortic regurgitation and the second patient with bicuspid aortic stenosis who underwent uneventful TAVI followed by successful LDLT. In conclusion, with the increasing expertise and experience in this procedure, an increasing number of potential recipients, previously considered as high-risk transplant candidates, can now be offered liver transplantation by performing pretransplant TAVI. © The Author(s) 2019.

Production, optimisation and engine characteristics of beef tallow biodiesel rendered from leather fleshing and slaughterhouse wastes

(2020) *Biomass Conversion and Biorefinery*, 10 (3), pp. 675-688. Cited 14 times.

Abstract
Presently, biodiesel is considered as an effective alternate fuel owing to its high sustainability and robustness. This paper concentrates on the biodiesel production from waste beef tallow rendered from subcutaneous and intramuscular wastes discarded from leather tanneries and slaughterhouses. The maximum fat content was estimated to be 92.5% and 3.05%, whereas maximum rendering efficiency was determined to be 92% and 75% for subcutaneous and intramuscular wastes, respectively. The rendered waste tallow was converted into biodiesel using ethanol as a solvent and l-valine amido ethyl methyl imidazolium bromide ([l-Vaemim]Br) as a novel ionic liquid catalyst. The most optimised reaction parameters are as follows: molar ratio of 1:7.5, catalyst concentration of 20 wt% of tallow, reaction temperature of 75 °C and reaction time of 160 min. Properties of the produced biodiesel have been tested in accordance with ASTM Standards, where the results were found to be within the permissible range. The engine characteristics of biodiesel exhibited increased heat release rate and maximum cylinder pressure, reduced emission levels than compared to ordinary diesel; in addition, its performance characteristics were similar to diesel, thereby making it a suitable replacement for existing fossil fuel. © 2019, Springer-Verlag GmbH Germany, part of Springer Nature.

Author Keywords
Animal slaughterhouses; Fatty acid esters; Leather tanneries; Subcutaneous and intramuscular wastes; [l-Vaemim]Br

Index Keywords

Abstract

The outstanding physico-chemical properties of carbon nanotubes (CNTs) applied to rectify the problems in bone tissue engineering through enhancing cell proliferation, adhesion and viability, which lead to the improvement in bone replacement, growth and healing. Hence, in this study, biocompatible polymers functionalized with CNTs and then synthetic bone minerals i.e. hydroxyapatite has been stabilized onto CNTs-polymer matrixes. Structural morphology of the materials was analyzed by spectroscopic/microscopic analyses. The cytotoxic property of nanohybrids was examined on osteoblast-like MG-63 cells. The lack of significant cytotoxic effect of nanohybrids suggested that the nanohybrids are considered as promising candidates for bone tissue engineering applications. © 2019, © 2019 Taylor & Francis Group, LLC.

Abstract
Abstract: This present study deals with production of biodiesel from waste beef tallow using co-solvent based transesterification. Waste tallow was dry rendered from discarded fleshing and processing wastes; whose maximum fat content was estimated to be 48.35 ± 0.87%, collectively. Following this, biodiesel was produced from rendered tallow using methanol as primary solvent; and ethanol as co-solvent in presence of potassium hydroxide as base catalyst. Ideal range for reaction parameters were decided based on reaction parameters optimized for methanol based and ethanol based transesterification separately. Accordingly, the optimal reaction conditions for methanol-ethanol based transesterification are as follows: (1) oil to alcohol molar ratio: 1:6; (2) methanol to ethanol molar ratio: 3/3; (3) catalyst concentration: 0.55% KOH; (4) reaction temperature: 70 °C; (5) reaction time: 35 min and produced a maximum yield of 97.2 ± 1.08%. Apart from production optimization, the resultant biodiesel/tallow methyl ethyl ester (TMEE) was evaluated for its thermal & physicochemical properties as per ASTM D6751 standards. Interestingly, the fuel properties of TMEE were found to be superior than compared to tallow methyl esters and was accounted by presence of ethyl esters in them. Abstract
Automatic detection and quantification of damage in the composite structure are a vital requirement in the assessment of the overall structural integrity of modern aerospace systems. In this work, the indentation-induced damage in the glass fiber-reinforced polymer composite (GFRP) laminates is investigated using multilevel threshold-based particle swarm optimization (PSO) and multifractals. Initially, the digital images are acquired after the composite laminates are subjected to 5 mm, 6 mm, and 7 mm indentation displacements. The indentation-induced damage images are filtered using anisotropic diffusion filter and damage regions are segmented using Tsallis-PSO method. The magnitude of the damage is analyzed using multifractal spectrum features. Results show that Tsallis-PSO with the four-level thresholds is optimal for the segmentation of the damage. Tsallis-PSO is also able to segment the boundaries of the damage precisely. The damage due to different levels of indentation depth is well differentiated by the multifractal spectrum features. Multifractal spectrum constructed using the scale, ranges from q = −1 to +1, discriminates the damage with a high statistical significance of P <.001. The damage dimension linearly progresses (R =.993) with increasing the level of indentation depth. Even though, the proposed process pipeline is an initial step of investigation of damages in GFRP, this framework can be used in the industries for the quantification of damage in GFRP composite laminates. © 2020 Society of Plastics Engineers

Abstract
The Bismuth based Zinc metal oxide (ZnBi12O20) nanorods were synthesized via single step solvothermal approach. The characterization of synthesized hybridized structure was done by several analysis such as X-ray diffraction (XRD), UV–Vis diffuse reflectance spectroscopy (UVvis–DRS), Fourier transform-infrared spectroscopy (FT–IR), Thermogravimetric analysis (TGA), Raman spectroscopy, Field-Emission scanning electron microscopy (FESEM), Energy dispersive analysis of X-rays (EDX), High-resolution transmission electron microscopy (HRTEM), X-ray photoelectron spectroscopy (XPS) and electrochemical impedance spectroscopy. The photocatalytic activity of ZnBi12O20 and an incorporation of varying weight percentages of GO (1–4 wt %) into ZnBi12O20 catalyst (GZBC) were analyzed under visible light irradiation by the degradation of an aqueous solution of Methylene blue (MB) and Methyl orange (MO) dye. Among various developed nanocomposites, 3 wt% GZBC reduced graphene oxide exfoliated nanocomposites has revealed the degradation efficiency as 96.04, 94.52% at 100 and 120 min for MB and MO respectively with enriched visible light absorption range. The photocatalytic property of 3 wt % reduced graphene oxide exhibits higher degradation behavior than that of other synthesized nano-composites. © 2020 Elsevier Ltd and Techna Group S.r.l.

Abstract
The novel Coronavirus disease 2019 (COVID-19) is caused by SARS-CoV-2, which is the causative agent of a potentially fatal disease that is of great global public health concern. The outbreak of COVID-19 is wreaking havoc worldwide due to inadequate risk assessment regarding the urgency of the situation. The COVID-19 pandemic has entered a dangerous new phase. When compared with SARS and MERS, COVID-19 has spread more rapidly, due to increased globalization and adaptation of the virus in every environment. Slowing the spread of the COVID-19 cases will significantly reduce the strain on the healthcare system of the country by limiting the number of people who are severely sick by COVID-19 and need hospital care. Hence, the recent outburst of COVID-19 highlights an urgent need for therapeutics targeting SARS-CoV-2. Here, we have discussed the structure of virus; varying symptoms among COVID-19, SARS, MERS and common flu; the probable mechanism behind the infection and its immune response. Further, the current treatment options, drugs available, ongoing trials and recent diagnostics for COVID-19 have been discussed. We suggest traditional Indian medicinal plants as possible novel therapeutic approaches, exclusively targeting SARS-CoV-2 and its pathways. © 2020 Elsevier B.V.

Abstract
In the present study, the antidiabetic formulation was evaluated for the invitro antidiabetic, antioxidant and a pilot invivo study was conducted with a mixture of herbal powders, i.e. Mimosa pudica L and Aegle marmelos (L) Corr. The formulation was screened for its antioxidant activity using DPPH free radical assay and inhibitory effect against the α-glucosidase and lipase compared with the standard. Assays were carried out at the concentration varying from 50 – 500 µg/ml (antioxidant activity) and 20 – 100 µg/ml (antidiabetic). Results of the present study have clearly indicated that the formulation possesses significant α-glucosidase enzyme inhibition property ranges from 41.4%-12.42% in the different concentration of aqueous extract and similarly pancreatic lipase inhibition potential at 50% with value of 100µg /ml revealed the significant activity. Moreover, the formulation administered in the diabetic patient reduces the glucose level of fasting and postprandial level, notably; thus, it indicates that it is a promising drug candidate that proves antidiabetic activity. © 2020, J. K. Welfare and Pharmascope Foundation. All rights reserved.

Author Keywords
Aegle marmelos; Antidiabetic formulation; Diabetes mellitus; Mimosa pudica; Mimosa pudica

Index Keywords
Aegle marmelos extract, antioxidant, Mimosa pudica extract, plant extract, plant medicinal product, unclassified drug; adult, Aegle marmelos, antidiabetic activity, antimicrobial activity, antioxidant activity, antioxidant assay, Article, case report, clinical article, diabetes mellitus, enzyme assay, enzyme inhibition, glucose blood level, high performance liquid chromatography, human, insulin sensitivity, lipid storage, male, medicinal plant, middle aged, Mimosa pudica, nonhuman, oxidative stress, phytochemistry, pilot study, ultra performance liquid chromatography, upregulation

Abstract
Numerous examinations have announced that the Nicotine present in tobacco smoke adverse affects sperm parameters, fundamental plasma, and different other richness factors. These harms are because of the natural finding that smoking expands the degree of free radicals, consequently bringing about oxidative pressure. Accordingly, an increment of free radicals, DNA harm and lipid peroxidation in human sperm may happen to bring about impedance of sperm quality. nicotine organization in trial creatures was initiate to influence spermatogenesis, epididymal sperm count, motility and treating capability of sperms. Huge quantities of restorative herbs have been recorded in siddha framework that improve spermatogenesis and increment the nature of sperm. The present review gives an outline on the relationship between male richness incited by nicotine and defensive impacts of different natural plants on it. The paper additionally features the dynamic, common standards, and rough concentrates of plants, which have been valuable in improving nicotine instigated testicular harms and supportive in spermatogenesis and multiplication. Despite the fact that the discoveries of this survey propose numerous herbs are extremely viable against nicotine actuated male barrenness still increasingly clinical preliminaries are prescribed to show their viability on nicotine instigated male infertility. © 2020 | All rights reserved.

Abstract
The arthritis is a chronic, inflammatory, autoimmune disease characterized by Pain, edema and stiffness of the joints. Chronic stages of arthritis causes swelling in and around the affected joints. The Siddha herbal medicines are becoming familiar as they possess less adverse effects. Plenty of anti-inflammatory herbs are described in Siddha system of medicine. The plant, bacopa monnieri maintains its original place in the management of various diseases, including arthritis, and acts as anti-inflammatory drug. Hardly a few studies are available to prove the antiarthritic and anti-inflammatory properties of Bacopa monnieri. In ancient Siddha literature Bacopa has been highlighted for its antiarthritic properties especially prescribed to reduce the swelling caused by increased synovial effusion. The current study is aimed to assess the antiarthritic and anti inflammatory properties of Bacopa (Brahmi) paste on swollen arthritic joints. A male patient aged 70 was selected from IPD, Pothu maruthuvam department, Sri Sairam Siddha Medical College & Research Center, Chennai-44. Bacopa Paste applied over swollen arthritic ankle joints showed good progress in very few days of treatment. © International Journal of Research in Pharmaceutical Sciences.

Effects of chitosan oligosaccharide and calcium hypochlorite on E. Faecali dentinal biofilm and smear layer removal-SEM analysis

(2020) *Indian Journal of Dental Research*, 31 (4), pp. 550-556.

DOI: 10.4103/ijdr.IJDR_334_20

Abstract

Background: The complex structure and irregularities of root canal walls are liable for infection by several bacterial species. Thus, the use of irrigants and auxiliary chemical solutions associated with instrumentation is necessary for effective eradication of the biofilm as well as complete removal of the smear layer. Aim: To evaluate the effects of calcium hypochlorite and chitosan oligosaccharide (COS) in disinfecting Enterococcus faecalis root canal biofilm and smear layer removal with minimal erosion. Materials And Methods: A total of 70 mandibular premolars were decoronated at the cementoenamel junction. The samples were biomechanically prepared, sterilized in an autoclave, and incubated with E. faecalis (ATCC-29212) bacteria for 21 days. Cleaning and shaping were done till maximum apical file size of #45 K. Specimens were randomly divided into 4 groups: GROUP I: Control Group, GROUP II: 5% Sodium Hypochlorite (NaOCl) solution followed by 17% EDTA solution, GROUP III: 5% Calcium Hypochlorite [Ca(OCl)2] solution followed by 17% EDTA solution and GROUP IV: 5% Ca(OCl)2solution followed by 1% COS. The samples were subjected to microbial count followed by smear layer removal under scanning electron microscope (SEM) at coronal, middle and apical third. Statistical Analysis Used: Kruskal-Wallis Test and post-hoc Scheffe's test. Results: It was observed that Group IV showed the lowest amount of CFU count/mL and the highest amount of smear layer removal with a statistically significant difference (P < 0.05) when compared with the other three Groups. Conclusion: 5% Ca(OCl)2solution with 1% COS solution effectively removed the Enterococcus faecalis biofilm and smear layer from the root canals with minimal erosion. © 2020 Wolters Kluwer Medknow Publications. Abstract
Bilateral invasive ductal carcinoma was seen in a 54 year old male patient. The bilateral breast mass showed microcalcifications on mammography and biopsy showed grade 2 papillary invasive ductal carcinoma. The patient gave a history of bilateral breast mass and bloody nipple discharge with a positive family history of breast carcinoma. © 2020, Advanced Scientific Research. All rights reserved.

Preliminary phytochemistry, gas chromatography-mass spectrometry, and high-performance thin-layer chromatography fingerprint analysis of ethanol extract of Costus speciosus rhizomes and its therapeutic implications

(2020) *Drug Invention Today*, 13 (7), pp. 1204-1211.

Abstract
Background: Costus speciosus is an ornamental plant mainly found in Southeast Asia. It is used in complementary and alternative medicine and claimed to have various therapeutic uses. Objective: The present study was done to highlight the phytochemical analysis of the ethanol extract of C. speciosus using preliminary phytochemical assays, gas chromatography-mass spectrometry (GC-MS), and high-performance thin-layer chromatography (HPTLC) fingerprint analysis for flavonoids. Results: The ethanol extract was prepared by Soxhlet method. The percentage yield was approximately 9.26 wt/vol. Preliminary phytochemical analysis of the plant extract revealed the presence of carbohydrates, proteins and amino acids, glycosides, alkaloids, phytosterols, flavonoids, saponins, tannins, and phenolic compounds. The GC-MS analysis showed six major peaks which were later identified to be 1-Dodecene, tridecane, 1-Hexadecene 2(4H)-Benzofuranone, 5,6,7,7a-tetrahydro-4,4,7a-trimethyl, phytol acetate, hexadecanoic acid, and ethyl ester. HPTLC fingerprint analysis of flavonoids showed the presence of nine different types of flavonoids. Conclusion: Our study concludes that the various isolated phytochemicals including flavonoids could be the cause for the potential therapeutic benefit of Costus speciosus. © 2020 JPR Solutions. Myristica fragrans seeds alleviate motor behavioural changes in rotenone model of parkinsons disease
(2020) *International Journal of Pharmaceutical Research*, 12 (3), pp. 1208-1215. Cited 1 time.

Abstract
Parkinson's disease (PD) the second most common and progressive neurodegenerative disorder affecting the old aged people. PD caused due to the depletion of population of dopaminergic (DA) neurons in niagro striatal system of brain. Natural and synthetic substances such as 6-hydroxydopamine, Rotenone, 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine, Paraquat, LPS and cycad were ascertained to be neurotoxic, crossed the blood brain barrier and caused deleterious effects over Dopaminergic neurons. Rotenone (plant derived pesticide) inhibitor of complex I in mitochondrial electron transport chain causes dopaminergic neuron cell death. In the current study, we investigated the effect of MFSE against rotenone induced PD model in rats by behavioural parameters (open field test, narrow beam walking test, hanging test). Rats were administered rotenone by intra-peritoneal route (2.5mg/kg daily) 30days. MFSE treated rats alleviated rotenone induced motor behavioural impairments significantly. It might be due to its positive interaction between dopaminergic neurons mediated through its anti-inflammatory, anti-oxidant, anti-epileptic properties. © 2020, Advanced Scientific Research. Abstract
Background & Objective: In hypothyroidism Muscle involvement is common. 30-80% of hypothyroid patients presenting with symptoms such as weakness, fatigue, tiredness & myalgia. Objective of the study is to determine the level of creatine kinase, lactate dehydrogenase (LDH) and aspartate transaminase (SGOT) and other thyroid parameters before and after the treatment of hypothyroidism. Methods and Materials: 50 newly diagnosed hypothyroid cases were included in the study. Serum analysis (Serum T3, T4, TSH) was performed to confirm the hypothyroid state in all subjects and CK, LDH and SGOT levels were determined. The tests were conducted again after patients were followed up for 3 months. Results: The mean value of T3, T4, FT3, FT4 was found to be 1.03±1.63, 3.3±2.51, 1.79±0.71, 1.14± 0.93& 63.84±35.23 before treatment and 1.38 ± 0.27, 5.92 ± 1.32, 3.09 ± 1.17, 1.36 ± 0.29& 18.45 ± 13.27 respectively after 3 months of treatment.There was a tatistically significant difference in T4, FT3 and TSH between the pre and post treatment group (<0.001). Conclusions: In our study serum enzymes like CK, LDH and AST were elevated which may help to diagnose hypothyroidism earlier, at the same time it determines the severity of hypothyroidism. © 2020, Advanced Scientific Research. Abstract
This work focuses on the evolution of a novel technique, employed to fabricate a plant fiber-reinforced composites without any hazardous chemical treatment for alternative carcinogenic synthetic fiber-reinforced polymer composites. The fibers were extracted from the agro-waste pseudostem of banana plant. Anatomical studies were carried out on fibers to ratify their reinforcement potentiality. The cellulosic fibers were needle-punched and commingled with unsaturated polyester for fabricating nonwoven needle-punched banana fiber composites (NPBFC). Quasistatic indentation tests were conducted for inducing damage on NPBFC, random banana fiber composites (RBFC), and random glass fiber composites (RGFC). Mechanical parameters, such as, peak force, linear stiffness, dent depth, and absorbed energy were used for evaluating indentation damage resistance. However, the optimal properties were achieved at 40 wt% fiber content. The load-bearing capacity of NPBFC having 2420 N is supercilious than RBFC and comparable with RGFC. Moreover, the extent of damage area and thermal diffusivity for optimized NPBFC are 178 mm2 and 0.11 mm2/s, respectively, computed using infrared thermography technique. This result reveals that the optimized NPBFC has better indentation damage resistance and thermal insulating property than RBFC and RGFC. This study concludes that the synthesized NPBFC can be used for the application of industrial safety helmet and automotive parts. © 2020 Society of Plastics Engineers

Abstract
Enhancing the performance of high luminescent and dielectrically capable cadmium sulfide nanowire (CdS NW) is of great importance, because of their promising ability in analyzing the dimensionality and size. The tuned physical characteristics of semiconductor CdS NWs allowed the manipulation of both electronic and optoelectronic devices at the nanoscale by dispersing a new bent core (BC) liquid crystal (LC) compound. This was derived from a 4-chlororesorcinol central core unit with two terephthalate based rod-like units carrying chiral (S)-3, 7-dimethyloctyloxy (namely ‘CPDB’) terminal chains, which have been synthesized in a pure solvo-chemical process. The mesomorphic properties of the newly-prepared bent-core LC, exhibiting an enantiotropy ‘Sm A’ phase as a result of dispersing 0.005% of CdS NWs, were investigated by several spectroscopic investigations. In addition, the hydrothermal fabrication of CdS NWs with a high-yield was modified with a cationic agent, cetyltrimethyl ammonium bromide (CTAB), which was utilized as a compatibilizer for providing a better interaction with LC molecules and giving a homogeneous solution. This work focused on the experimental investigation and optimization, using a combinational view of bent-core liquid crystal (CPDB) compound dispersion which was achieved in a controllable manner. The product of the resulting composite matrix has a very outstanding and promising behavior, e.g. semiconductor nanostructures emission polarization that can be manipulated using an external bias modulation of the novel switchable device, which was found quite convincing in the recent trends of brand-new technologies. In particular, the electro-optic responses by POM of various mesophases were investigated from the view point of the CdS incorporated bent-core LC matrix formation and transitional phase variants of ‘ON’ and ‘OFF’ states, which were depending on the geometrical parameters of CdS NW's. Finally, the future challenges and prospects of any other nanomaterials dispersed into CPDB compound which will give rise to an increase of the mesomorphic range by preserving the mesophase type were explored in detail. © 2019 Elsevier B.V.

Prof.(Dr.)Kaushik Pal belongs to an Indian citizen and born in Kolkata. Most Recently, he working as a “Visiting Professor” at IIUCN, School of Energy Materials, Mahatma Gandhi University, Kottayam, Kerala . He received his Ph.D. from University of

Kalyani . Most significant prestigious awards " Marie-Curie Experienced Researcher (Postdoctoral Fellow) " offered by the European Commission in Greece and " Brain Korea (BK-21) National Research Foundation Visiting Scientist Fellowship " in South Korea achieved in his research career. He was appointed " Senior Postdoctoral Fellow " at Wuhan University, China and within a year achieved a prestigious position " Chief-Scientist & Faculty (CAS) Fellow " by Chinese Academy of Science . He served as "Research Professor (Group Leader & Independent Scientist)" , at Bharath University (BIHER), Department of Nanotechnology /(R & D), Chennai . His current spans are focusing e.g. Nanofabrication, functional Materials, condensed matter physics (Expt.), CNTs/graphene, liquid crystal, polymeric nanocomposite, switchable device applications. He supervises a significant number of Bachelors, Masters, Ph.D. and Postdoctoral scholar's in worldwide. His outstanding research finding and novelty published around 65-articles in several international top-tier journals Nanotechnology, Royal Chemical Society, Elsevier, Springer, Apple Academic Press, IEEE, In-Tech publications got the highest citation in every year and as an editorial board member perform editing25 - book's chapters in significant journals Elsevier, Pan-Standford, CRC press and 9 - Review Articles. Prof. Pal is an expert group leader as well as the associate member of various scientific societies, reorganizations and professional bodies. In his academic and professional research carrier received significant awards and prizes from UFRJ in Brazil; University of Maribor in Slovenia; Cheap Tubes Inc R & D Scientist in USA; University of Malaya in Malaysia; Yarmouk University in Jordan . He was the chairperson and organized around 25- National or International events, Symposium, Conferences, Workshops, Summer Internship programs, and himself contributed around 10-Plenary , 25-Keynote and 30-Invited lectures worldwide.

Funding details

The author Dr. Kaushik Pal is grateful to his associate colleagues and doctoral research scholars at Wuhan University, China. Dr. Pal owe to his sincere thanks to his colleagues including Bachelor/Masters students, spectroscopy/electron microscopy operators, as well as the entire team of researchers from Chonbuk National University, South Korea and CERN Research lab in Switzerland and the concern Professor Mitja Slavinec, Dean of University of Maribor, Slovenia are also gratefully acknowledged. Sincere ?Thanks? to Vice-Chancellor Prof. Sabu Thomas for utilizing IIUCN, School of Chemical Science Laboratory and School of Energy Materials, at Mahatma Gandhi University for providing excellent research foundation.

Abstract
An impressive, nonlinear optically active single crystal, acid potassium hydrogen fumarate (2KC4H3O4.C4H4O4)(APHF)was grown by slow evaporation technique. Single crystal X-ray diffraction analysis confirms packing array and attribute of molecular geometry. FTIR and FT Raman studies aid to identify basic functional groups present in the crystal. UV–Vis spectral analysis predicts cut off wavelength as 295 nm. The Photo luminescence spectra shows an emission around 453 nm and its lifetime was also detected. Low dielectric constant of APHF can be utilized for microelectronics device fabrications. Vicker's microhardness test reveals the greater mechanical strength of APHF. TG and DSC studies shows thermal stability up to 253 °C.The total charge spread is described by Molecular electrostatic potential. Low HOMO-LUMO energy gap affirms the chemical softness of the material. The negative third order nonlinear parameters like refractive index (n2), absorption coefficient (β) and susceptibility (χ3) were estimated by Z-scan studies. © 2020 Elsevier B.V.

Author Keywords
Crystal growth; Nonlinear optical material; TG/DTA studies; Vicker's microhardness; Z-Scan

Index Keywords
Crystal growth, Fourier transform infrared spectroscopy, Hydrogen, Luminescence, Microelectronics, Microhardness, Optical materials, Potassium, Refractive index, Single crystals, Spectrum analysis, X ray powder diffraction; Molecular electrostatic potentials, Non-linear optical material, Photo- luminescence spectrum, Single crystal X-ray diffraction analysis, Slow evaporation techniques, TG/DTA studies, Vicker's micro hardness, Z-Scan; Nonlinear optics

Funding details
The authors accede to SAIF, IIT Madras for providing single crystal XRD, FTIR, FT-Raman and thermal analysis measurement. Also the facilities rendered by Department of Physics, St. Joseph College, Trichy for providing UV measurements are gratefully acceded. The authors sincerely thank to facilities extended by Department of Physics and Chemistry of B.S.Abdur Rahman University for providing SHG facility, Laser damage threshold and Loyola College, Chennai for providing dielectric facilities.

Abstract
Abstract: The (E)-2-(benzo[d]thiazol-2-yl)-3-(5-(4-(diphenylamino) phenyl) thiophen-2-yl) acrylonitrile TP1 dye has been investigated as new fluorescent chemosensor for cyanide anions. The dye TP1 acted as strong turn on fluorescent sensor after addition of the cyanide anions. Upon addition of cyanide anions to dye TP1 solution induced a change in the solution color from red to green color under the naked-eye detection. While no color change could be observed in presence of other common-anions. The detection limit of dye TP1 for cyanide anions was found to be 4.24 × 10−8 M. Graphic abstract: [Figure not available: see fulltext.] © 2020, Springer Nature Switzerland AG.

Abstract

Introduction: Aluminum (Al) is proven to cause pathogenesis in neurodegenerative disorders such as Alzheimer's disease. Our study explored the potential effect of Al in apoptosis and neuroprotective role of Bacopa monnieri (BM) against aluminum chloride (AlCl3) -induced neuronal damage in the hippocampus of Wistar rats. Materials and Methods: Sixty male Wistar rats were assigned into five groups: Control group was administered orally with distilled water, and 0.5% tween 80, AlCl3group received aluminum chloride (AlCl3); protective groups (BM100+AlCl3group and BM200+AlCl3group) were concurrently administered with AlCl3and BM at two different doses; BM200 group received only BM. The administration of drug and chemical lasted for 4 weeks. The hippocampal malondialdehyde (MDA) and glutathione peroxidase (GPx) levels were estimated at the end of the experiment. Furthermore, neuronal quantification was performed in the dentate gyrus of the hippocampus to identify the viable neurons and dark neurons. Results and Discussion: BM reduced the neuronal deterioration caused by AlCl3as it is evident from more number of viable neurons and few dark neurons seen in protective groups compared with AlCl3group. This observation is supported by oxidative stress markers such as GPx and MDA, which are also critical regulators of apoptosis. Conclusion: BM protected the neurons in the dentate gyrus of hippocampus from neuronal insults produced by AlCl3. © 2020 JPR Solutions. All rights reserved.

Author Keywords

Aluminium chloride; Alzheimer's disease; Apoptosis; Bacopa monnieri; Dentate gyrus; Glutathione peroxidase; Hippocampus; Malondialdehyde

Index Keywords

aluminum chloride, distilled water, glutathione peroxidase, herbaceous agent, malonaldehyde, polysorbate 80; adult, animal experiment, animal tissue, antioxidant activity, apoptosis, Article, Bacopa monnieri, brain nerve cell, controlled study, dentate gyrus, hippocampus, male, nervous system development, neuroprotection, neurotoxicity, nonhuman, oxidative stress, rat

Chemicals/CAS

aluminum chloride, 7446-70-0, 7784-13-6; glutathione peroxidase, 9013-66-5; malonaldehyde, 542-78-9; polysorbate 80, 9005-65-6, 8050-83-7

Abstract
Introduction: Vulvovaginal candidiasis(VVC) is an important health disorder among women which is caused due to drug resistance in Candida species. C.albicans is the most common pathogenic species among Candida. However, the Non albicans Candida (NAC) species is on the rise, so the appropriate identification of the Candida sp. will pave way for better management and minimising the emergence of drug resistance. The aim of this study is to analyse the species distribution and their antifungal susceptibility pattern of Candida sp. in patients with suspected vaginitis. Materials and methods: A total of 153 women of age 15–40 years with complaints suggestive of vaginitis were clinically examined and high vaginal swabs were taken from them. Samples were inoculated on Sabouraud Dextrose agar and Hi-Crome Candida differential agar. Identification of Candida sp. was performed using conventional methods and with Vitek2 Compact (Biomerieux France) using vitek 2 cards for identification of yeast and yeast like organisms (ID-YST cards). Multidrug resistant Candida isolates were analysed for biofilm forming ability and their identification was confirmed with amplification and sequencing of internal transcribed space regions with specific PCR. Results: In total, 63 Candida isolates were identified from the samples. Candida albicans (59%) was the most common species isolated in the study. The Non albicans Candida species (41%) isolated in the study were C. tropicalis, C. glabrata, C. krusei and C. auris. Discussion: C. albicans is one of the common opportunistic fungal pathogen which causes mucocutaneous infections of genital and non-genital tracts of healthy individuals. It is a polymorphic yeast which exists in different morphologies which facilitates its survival under stress environments by forming biofilms. High prevalence of non albicans Candida sp. in this study indicates the importance of conducting epidemiological surveys to measure the occurrence of NAC. Multiplex PCR is a rapid and reliable method to identify the Candida sp. causing vulvovaginal candidiasis. Although fluconazole still appears to be effective against most of the Candida isolates, resistance rate of this drug to the Candida sp. emphasises the need for performing antifungal susceptibility testing and alternate drug therapy in the routine practice. © 2020 Elsevier Inc.

Abstract
Gastrointestinal (GI) cancers are among the prime causes for cancer deaths worldwide demanding competent methods for prediction and diagnosis. MiR-146a, a key modulator of immunity and inflammation, harbors a single nucleotide polymorphism (SNP) rs2910164 which leads to ineffectual suppression of the miR146a targets TNF receptor-associated factor 6 (TRAF6) and interleukin-1 receptor-associated kinase 1 (IRAK1). In the current study, we aimed to bring out the relationship of rs2910164 with GI cancers and their impact on the target genes. We conducted a case-control study with 180 gastrointestinal cancer patient and 230 cancer-free control recruits. The polymorphism was genotyped using Polymerase Chain Reaction-Restriction Fragment Length Polymorphism (PCR-RFLP) method and the target gene expression was done by quantitative Real Time PCR. Our study reported that the polymorphism studied had no association with GI cancers as such, but it was significantly associated with the risk of human colorectal cancer (CRC). Following these results, expression of Nuclear factor kappa B (NF-κB), TRAF6 and IRAK1 were analyzed in the archived CRC tissues for the three genotype carriers. The expression of IRAK1 and TRAF6 genes were found to be elevated in the GC and CC carriers and NF-κB which regulates the expression of miR-146a by negative feedback mechanism was also elevated in the mutant genotypes. This is the first study to show that miR-146a polymorphism increased the susceptibility to CRC apparently by influencing the expression of its target genes in an Indian population. © 2020 Elsevier B.V.

IEC-NI/13/APR/33/39
Funding details
We thank all the participants who had consented for the study, the technical staff of the Pathology department and the Central laboratory of Sri Ramachandra Medical Centre for their constant support. We are immensely grateful to the management of Sri Ramachandra Institute of Higher Education (Deemed to be University) for supporting our study through the Founder Chancellor Research Fellowship for ZSS and SSK.
Funding details
The study was ethically approved by the Institutional Ethics Committee of Sri Ramachandra Institute of Higher Education and Research (Deemed to be University) IEC-NI/13/APR/33/39. The study was conducted as per the declaration of Helsinki and ICMR ethical guidelines for biomedical research. The study was explained to all the participants and their voluntary written consent was obtained before collecting the blood samples.

Experimental Investigation of Heat transfer and Friction Factor Characteristics with Triangular-cut Twisted Tape (TCTT) Inserts

(2020) *Proceedings of the National Academy of Sciences India Section A - Physical Sciences*, 90 (2), pp. 353-357. Cited 1 time.

DOI: 10.1007/s40010-018-0573-8

Abstract
An experiment was conducted to investigate the heat transfer characteristics and friction factor characteristics of a concentric tube fitted with triangular-cut twisted tape (TCTT) insert with a twist ratio Y of 5.4 and depth of triangular cut of 1.2 cm, which were studied for laminar flow. This investigation also is used to find the heat transfer coefficient, Nusselt number and Reynolds number. The heat transfer enhancement was caused with the flow of fluid between the plain twisted tapes and TCTT. The experimental value of plain tube and triangular-cut twisted tube obtained from the experimental work and these two statistical data were compared with the results. The results show that the enhancement of heat transfer rate induced with plain and TCTT inserts increases with the increase in Reynolds number. The Reynolds numbers were varied in the range of 5710–18,366. The Reynolds number in the tube with triangular- cut twisted tape insert were enhanced by 1.1–1.3 times compared with smooth twisted tape inserts. The configuration of TCTT insert offered higher heat transfer rate and friction factor than that of the plain twisted inserts. © 2019, The National Academy of Sciences, India.

Abstract
Introduction: The present study deals with the gas chromatography-mass spectrometry (GC-MS) analysis of one Ayurvedic digestive powder, Trikatu Churnam. Materials and Methods: The Trikatu Churnam was procured for standard Ayurvedic vendor at Chennai and was subjected to GC-MS analysis by the standard as per the standard procedure. Results: The GC-MS profile indicated the presence of some important biomolecules such as longipinocarveol, trans-., beta-bisabolene, caryophyllene oxide., alpha.-ylangene, dodecanedioic acid, ursodeoxycholic acid, 1(2H)-naphthalenone, octahydro-4a,8a-dimethyl-7-(1-methylethyl)-, [4aR-(4a.alpha.,7.beta.,8a.alpha.)]-, 3-methyl-1-adamantaneacetic acid, thiazole-2,4(3H,5H)-dione, 5-benzylideno-3-[(ethylphenylamino)methyl]-, and i-propyl 5,9,17-hexacosatrienoate, which has medicinal roles indicating the efficacy of Trikatu Churnam as a medicine for digestive disorders. Conclusions: The above results and discussion indicates that Trikatu churnam is a good formulation for digestive disorders. © 2020 JPR Solutions. All rights reserved.

Abstract
Objective: The study envisages finding the molecules present in one Ayurvedic medicine, Avipathi churnam, which is prescribed to treat digestive disorders by gas chromatography-mass spectrometry (GC-MS) analysis. Materials and Methods: Avipathi churnam was procured from standard Ayurvedic medicine vendor at Chennai, India, and was subjected to GC-MS analysis following standard procedures. Results: The GC-MS profile shows the presence of some important biomolecules of medicinal importance such as cis-5,8,11-Eicosatrienoic acid, methyl ester, 6,6-Dimethyl-2-(2-methyl-allyl)-1,6-dihydropyrimidine-4-Carbonitrile, 3-Cyclohexene-1-methanol.,alpha.,alpha.,4-trimethyl-, acetate, 2(1H)-Isoquinolinecarboximidamide, 3,4-dihydro-.,beta.-ylangene, Caryophyllene oxide, 7-Methyl-Z-tetradecen-1-ol acetate, 12-Hydroxy-14-methyl-oxa-cyclotetradec-6-en-2-one.,beta.-sitosterol, 9, 19-Cyclolanost-24-en-3-ol, acetate, (3.beta.)-, Ursodeoxycholic acid, Butyl 9.cis., and 11.trans.-octadecadienoate which augur well with the medicinal properties of Avipathi churnam. Conclusion: The GC-MS analysis results indicate the medicinal efficacy of Avipathi churnam as a good digestive formulation. © 2020 JPR Solutions. All rights reserved.

Abstract
Objective: The present study deals with the gas chromatography-mass spectrometry (GC-MS) analysis of one Ayurvedic tooth powder Dasanakanti Churnam to understand the various molecules present in it. Materials and Methods: The medicine, Dasanakanti Churnam, was procured from a standard Ayurvedic vendor at Chennai and was subjected to GC-MS analysis following standard procedure. Results: It was observed that some medicinally important molecules such as.alpha-campholenal, isoborneol, 1H-indole, 3-methyl-, eugenol.,beta-ocimene, benzenebutanoic acid.,alpha.,alpha.-dimethyl-.gamma.-oxo-, cis-5,8,11,14,17-eicosapentaenoic acid, n-hexadecanoic acid, 2-phenyl-3-methoxy-cyclopropane-1-carboxylic acid, dodecanoic acid, phenylmethyl ester, cyclobutanecarboxylic acid, 2-phenylethyl ester, 6,9,10-trimethoxy-12H-benz(6,7)oxepino(2,3,4-i,j)isoquinoline, succinic acid, di(3,7-dimethyloct-6-en-1-yl) ester, octanoic acid, 1-ethenyl-1,5-dimethyl-4-hexenyl ester, 5-(1-Cyclohexenyl)-5-ethyldihydro-4,6(1H,5H)-pyrimidinedione.,beta.-carbolin-1-one, 6-methyl-2,3,4,9-tetrahydro-.,beta.-carbolin-1-one, 6-methyl-2,3,4,9-tetrahydro-, trans-Farnesol, benzamide, and 2-methoxy-N-allyl- were present which indicated far-reaching medicinal roles in tune with that of Dasanakanti Churnam. Conclusion: It is concluded that Dasanakanti Churnam, as shown by the GC-MS profile, contains some important molecules that help Dasanakanti Churnam as a good medicine. © 2020 JPR Solutions. Abstract
Objective: There is an urgent need to prove the authenticity of Ayurvedic medicines in the light of modern scientific knowledge. Methods: The present study deals with the gas chromatography-mass spectrometry (GC-MS) analysis of one herbal oil, Kunthalakanti Thailam, to understand the molecules present there in. Kunthalakanti Thailam was bought from a standard Ayurvedic vendor from Chennai. It was processed and GC-MS analysis was done by standard procedures. Results: The GC-MS report indicated the presence of mostly fatty acids and their esters which have potent antioxidant and antiallerg ic properties such as N-Hexadecanoic acid, 2-Methyl-3-93-methyl-but-2-enyl)-enyl)-oxetane, 3, 7-decadien-2-one, and 10-(3,3-dimethoxyloxiran dimethyl-, (E, E)-, +/- which have medicinal activities which help in keeping the homeostasis of the scalp and maintain good health to hair follicles and hair. Some important biomolecules have medicinal properties supporting the validity of skin treatment with this oil. Conclusions: The presence of these biomolecules having medicinal properties supports the validity of Kunthalakanti Thailam as skin and hair health treatment. © 2020 JPR Solutions. Abstract
Objective: The present study deals with the GC-MS analysis of one Ayurvedic Rasayana medicine, Sonitha Amritha Rasayanam. The medicine is used for purifying the blood and for skin diseases. Methods: The medicine was procured from standard Ayurvedic vendor at Chennai and was subjected to GC-MS analysis with due procedure. Results: The GC-MS profile indicated the presence of molecules such as ketone, isopropylidenecyclopropyl methyl, benzoic acid, hydrocinnamic acid, 1-butanone, 2-hydroxy-1-phenyl-, myrtenoic acid, ethyl ester, 1, 1-diphenyl-4-phenylthiobut-3-en-1-ol, arteannuic acid, 1,1-diphenyl-4-phenylthiobut-3-en-1-ol, (1Ar-(1aalpha,4abeta,8as(*)))-4a,8,8-trimethyloctahydrobenzo. ©cyclopropa(d)pyran-2,4-dione, 1,2-Benzenedicarboxylic acid, and mono(2-ethylhexyl) ester which do have medicinal value directly or indirectly indicating the role of this medicine as an effective skincare tonic. Conclusion: This knowledge could lead to further research to pinpoint the roles of each molecule toward the medicinal role of Sonitha Amritha Rasayanam.

Author Keywords
1-Butanone; 2-hydroxy-1-phenyl-; Arteannuic acid; Ayurvedic; Benzoic acid; Ethyl ester; Gas chromatography-mass spectrometry; Hydrocinnamic acid; Myrtenoic acid; Sonitha Amritha Rasayanam

Index Keywords
1 butanone, 1 diphenyl 4 phenylthiobut 3 en 1 ol, 1,1 diphenyl 4 phenylthiobut 3 en 1 ol, 1,2 benzenedicarboxylic acid mono(2 ethylhexyl)ester, 2 hydroxy 1 phenyl, 2 [4 methyl 6 (2,6,6 trimethylcyclohex 1 enyl)hexa 1,3,5 trienyl]cyclohex 1 en 1 carboxaldehyde, 3 oxo 10(14) epoxyguai 11(13) en 6,12 olide, acetic acid (benzoylamino)hydroxy, androsta 1,4 dien 3 one 17 hydroxy 17 methyl (17alpha), apocynin, artemisinic acid, ayurvedic drug, benzene 2 methoxy 1,3 dimethyl, benzoic acid, benzoyl isocyanate, corydine, hydrocinnamic acid, isopropylidenecyclopropyl methyl, ketone, ketone isopropylidenecyclopropyl methyl, mono(2 ethylhexyl) ester, myrtenoic acid ethyl ester, phthalic acid, unclassified drug, [3,3 dimethyl 2 (3 methylbuta 1,3 dienyl)cyclohex 1 enyl]methanol; Acalypha indica, Article, Ayurveda, Hemidesmus indicus, mass fragmentography, nonhuman

Chemicals/CAS
apocynin, 498-02-2; artemisinic acid, 80286-58-4; benzoic acid, 532-32-1, 582-25-2, 65-85-0, 766-76-7; hydrocinnamic acid, 501-52-0; phthalic acid, 88-99-3

Abstract
Objective: The present study deals with the gas chromatography-mass spectrometry (GC-MS) analysis of one famous nerve stimulating tonic, Dhanwantari Rasayanam. This knowledge of the molecules present in this medicine could indicate the mechanism of action of this medicine, which is basically used to treat nerve-related disease such as paraplegia, hemiplegia, and muscle wasting. Materials and Methods: Dhanwantari Rasayanam was brought from standard Ayurvedic vendor from Chennai. The GC-MS analysis was conducted following standard procedures. Results: It was observed that there are some important biomolecules such as heptanediamide, N,N'-di-benzoyloxy-, 5-Hydroxymethylfurfural.,beta.-Asarone, Tetradecanoic acid, 15-Hydroxypentadecanoic acid, oleic acid, hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester, hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester, and 26-Nor-5-cholesten-3.beta.-ol-25-one show some interesting biological activities which are in tune with the medicinal roles of Dhanwantari Rasayanam. Conclusion: The results indicate a positive correlation between the medicinal roles of molecules present in GC-MS profile and that of the Rasayanam itself. © 2020 JPR Solutions. All rights reserved.

Abstract
Objective: The present study deals with the gas chromatography-mass spectrometry (GC- MS) analysis of one digestive Ayurvedic formulation, Induppukanam. Materials and Methods: Induppukanam was procured form a standard Ayurvedic vendor at Chennai and was subjected to GC-MS analysis following standard procedure. Results: Some important molecules such as thymol, Methyl-4,7,10,13-hexadecatetraenoate, Chloroacetic acid, pentadecyl ester, Methyl-4,7,10,13-hexadecatetraenoate, Santalol, E-cis,epi-.beta.-, n-Hexadecanoic acid, 4-Vinylbenzoic acid, 2-Phenyl-3-methoxy-cyclopropane-1-carboxylic acid, Ricinoleic acid, 5-Methyl-5-triazolo(1,5-a)pyrimidine etc. have mostly actions related to hormonal balance. The role of some molecules such as 1,2,3-Benzenetriol, (4R,5S)-4-Hydroxymethyl-5-hydroxytricyclo[4.4.0.0(3,8)]decane, Nonane, 2,2,4,4,6,8,8-heptamethyl-, (R)-(-)-14-Methyl-8-hexadecyn-1-ol, 9-Octadecenoic acid, (E)- and 2H-Pyrazino[1,2-b]isoquinoline-1,3(4H,6H)-dione, and 2-(4-fluorophenyl)-11,11a-dihydro-8,9-dimethoxy- are known. Conclusion: The direct evidence of Induppukanam as digestive formulation is not reflected by the molecules, whose roles are known. It will be of interest to work on those molecules whose medicinal roles are not reported yet, which could lead to a better understanding of the mechanism of action of Induppukanam. © 2020 JPR Solutions. Abstract
Objective: The present study deals with the gas chromatography-mass spectrometry (GC-MS) analysis of one Ayurvedic formulation, Tiktaka Ghrita, which is prescribed for skin diseases. Materials and Methods: The medicine was procured from standard Ayurvedic vendor at Chennai and was subjected to GC-MS analysis after due processing. Results: It was observed that there are some important biomolecules such as Eucalyptol, o-Acetyl-L-serine, Phenylethyl Alcohol, 2-Allyl-3-hydroxy-2-methylsuccinic acid, 1-ethyl ester, Glycerine, Succinic acid, ethyl non-5-yn-3-yl ester, Cyclohexanecarboxylic acid, 1-ethyl-, Benzeneethanol, 4-hydroxy-, and 2,4,6,(1H,3H,5H)-Pyrimidinetrione, 5-acetyl- which augur well with the medicinal role of Tiktaka Ghrita. Conclusion: It was observed that the molecules present in the GC-MS profile do show some relationship with that of Tiktaka Ghrita as a medicine. © 2020 JPR Solutions. All rights reserved.

Abstract
Objective: The aim of the present study is to known about the types of molecules present in one Ayurvedic medicine, Srikhandasavam prescribed for alcohol de-addiction and liver protection, by gas chromatography-mass spectrometry (GC MS) analysis. Materials and Methods: Srikhandasavam was procured from standard Ayurvedic vendor at Chennai and subjected to GC MS analysis by standard procedure. Results: It was observed from the GC MS report that there are some very important present in Srikhandasavam which augur well with the role of this medicine. Conclusion: It is concluded that Srikhandasavam is a very good and potent medicine for alcohol de-addiction. © 2020 JPR Solutions. All rights reserved.

Anti-arthritic Property of Sahacharadi Kashayam against Freund's Complete Adjuvant Induced Arthritis in Wistar Rats

(2020) *Pharmacognosy Journal*, 12 (3), pp. 459-464. Cited 1 time.

Abstract
Introduction: The available modern molecular drugs for the therapy of Rheumatoid arthritis are beset with several side effects and alternative drugs are urgently needed. The present investigation was performed to evaluate the anti-arthritic activity of Sahacharadi Kashayam (SK), an Ayurvedic formulation, against Freund's complete adjuvant (CFA) - induced arthritis in rats. Methods: In this experimental trial, SK was administered at doses of 0.5, 1.0 and 1.5 ml/kg body weight orally to adjuvant (CFA) induced arthritic rats. The anti-arthritic activity was evaluated by using paw volume, haematological parameters and arthritic biomarkers. The efficacy of the Kashayam was compared with the standard Leflunomide (10 mg/kg) drug. Results: Significant reduction in paw volume and thickness by SK (0.5 ml dose) has been found and there was considerably improvement in haematological parameters and arthritic markers in CFA rats till 14 days. After 14th day SK treatment with doses (1.0 and 1.5ml), however, reoccurrence of inflammation and pathological changes were observed in rats. Conclusion: The study clearly indicated the anti-arthritic role of SK. Future studies, however, are warranted to provide a new approach in relation to the therapeutic dose and treatment period of SK which may eventually lead to the development of a new category of the anti-arthritic agent. © 2020 Phcogj.Com. Abstract
Introduction: In the management of neurodegenerative and neuropsychiatric diseases, memory loss remains very challenging. Saraswatharishtam (SWRT) is an ayurvedic formulation prescribed for several neurological ailments like acute anxiety, partial memory loss, slurred speech, neuro-degenerative diseases like Parkinson's, Alzheimer's etc. Methods: Present study explores the possibilities of curative effects of SWRT on Scopolamine induced memory impairment and to compare the effects of commonly used drug Piracetam. Adult Wistar Swiss albino mice were used for this experiment and divided into five different groups for the treatments of the drugs in various combinations. The first group was vehicle treated control while the second group was treated with scopolamine to induce memory impairment. The third groups of animals were treated with Scopolamine where the mice were pretreated with standard neuro-protective drug Piracetam, while the fourth and fifth groups of animals were treated with scopolamine and the animals were pretreated with SWRT at the doses of 200 and 400 mg/kg respectively to compare with the effect of Piracetam. Scopolamine was administered on day eight, only for 45 minutes in all the cases (Group I- Group V). Several neurobehavioral parameters were examined to confirm the neuro-protective effects of SWRT. Results: Saraswatharishtam significantly reversed the memory loss in mice model as revealed from elevated plus maze, radial maze and rectangular maze experiments justifying its neuroprotective potential as observed in usually used synthetic Piracetam. SWRT was found to be nontoxic and very promising antioxidant recorded from acute and chronic toxicological studies. Conclusions: It is suggested that SWRT, could be used as safe and easily available Ayurveda medicine to treat neurological dysfunctions without any side effects. Further translational research is needed to explore its neuro-protective potential. © 2020 Phcogj.Com. Abstract
Reduced graphene oxide – cerium oxide (rGO-CeO2) nanocomposite is prepared by simple hydrothermal method for enhanced charge storage supercapacitor performance. The prepared nanocomposite is characterized by various techniques, such as X-ray diffraction (XRD), Fourier Transform – Raman Spectra (FT-Raman), Field Emission - Scanning Electron Microscope (FE-SEM), High Resolution –Transmission Electron Microscope (HR-TEM), Thermo-gravimetric and Differential Thermal Analysis (TG-DTA), Cyclic Voltametric (CV), Galvanostatic Charge/Discharge (GCD) and Electrochemical Impedance Spectroscopy (EIS) studies to understand its morphology, composition, thermal stability and charge storage efficiency as electrode material. The nanocomposite formation is confirmed with FE-SEM and HR-TEM images where the ceria is anchored on the surface of the graphene sheets and the interplanar distances are observed as fringes. The Energy Dispersive Analysis of X-Ray (EDAX) has provided substantial evidence for the nanocomposite formation with the elemental composition. The maximum specific capacitance is measured as 280 F/g using GCD studies. The surface area of the nanocomposite is determined using the Brunauer-Emmett-Teller (BET) analysis. © 2020

Abstract
This paper reports the fabrication of MnO2–CuO nanocomposite by a hydrothermal approach for supercapacitor applications. The crystal nature, morphology and chemical states of synthesized MnO2–CuO nanocomposite were examined by powder XRD, FT-IR, HRSEM, TEM, EDX, XPS and its electrochemical performance of as prepared nanocomposite materials as supercapacitor electrodes is measured by CV, GCD and EIS, The MnO2–CuO nanocomposite shows a higher specific capacitance (279.12 Fg−1) than individual compounds of MnO2 (175.51 Fg−1) and CuO (191.06 Fg−1) at a current density of 0.5 Ag−1. The cycle life of the composite was also excellent. After 10,000 cycles, it maintained 91.26% of its beginning capacitance. The electrochemical results showed that the MnO2–CuO nanocomposite is a suitable material for electrode fabrication of a supercapacitor. © 2020 Elsevier B.V.

Abstract
Objective: This study aims to detect pathogenic Escherichia coli (E. coli) bacteria using non-destructive fluorescence microscopy and micro-Raman spectroscopy. Results: Raman vibrational spectroscopy provides additional information regarding biochemical changes at the cellular level. We have used two nanomaterials zinc oxide nanoparticles (ZnO-NPs) and gold nanoparticles (Au-NPs) to detect pathogenic E. coli. The scanning electron microscope (SEM) with energy dispersive X-ray (EDAX) spectroscopy exhibit surface morphology and the elemental composition of the synthesized NPs. The metal NPs are useful contrast agents due to the surface plasmon resonance (SPR) to detect the signal intensity and hence the bacterial cells. The changes due to the interaction between cells and NPs are further correlated to the change in the surface charge and stiffness of the cell surface with the help of the fluorescence microscopic assay. Conclusions: We conclude that when two E. coli strains (MTCC723 and MTCC443) and NPs are respectively mixed and kept overnight, the growth of bacteria are inhibited by ZnO-NPs due to changes in cell membrane permeability and intracellular metabolic system under fluorescence microscopy. However, SPR possessed Au-NPs result in enhanced fluorescence of both pathogens. In addition, with the help of Raman microscopy and element analysis, significant changes are observed when Au-NPs are added with the two strains as compared to ZnO-NPs due to protein, lipid and DNA/RNA induced conformational changes. © 2020, Springer Nature B.V.

Abstract
Clothing with high branded images has a great an immense impact in garment market for satisfying the desire of customers. Benefit seeking is one of the driving forces for consumers to begin their buying process. When people talk about the clothes they buy and why they buy them, they show a variety of logics. An understanding of why customers select one brand over another and what factors generate such kind of want is crucially important to fashion marketers. Positive brand associations are developed if the product which the brand depicts is durable, marketable and desirable. The customers must be persuaded that the brand possess the features and attributes satisfying their needs. © 2020 SERSC.

Abstract
The equimolar molecular adducts 2-aminopyrazinium hydrogen tartrate (APZHT) has been synthesized and inspected by the experimental and theoretical access. The molecular structure of APZHT was elucidated by single crystal X-ray diffraction analysis and it confirms the monoclinic crystal system with P21/n space group. To validate the observed experimental results and investigate the molecular properties of APZHT molecule, density functional theory (DFT) calculations have been carried out by Gaussian 09 program. Molecular structure optimization, vibrational frequency calculation and molecular properties such as Mulliken atomic charge distribution, frontier molecular orbital analysis and natural bond orbital analysis have been studied by DFT calculation. The natural bond orbital analysis was carried out to interpret hyper conjugative interaction and intramolecular charge transfer. The frontier molecular orbital analysis shows the pharmaceutical activity of the compound. The antibacterial activity for APZHT compound was screened against human pathogens. © 2020 Elsevier B.V.

Abstract
The percentage of diabetic patients all over the world is increasing day by day. Diabetes is the third widespread and serious disease after heart disease and cancer. Lifestyle diseases characterize those diseases whose occurrence is primarily based on the daily habits of people and are a result of an inappropriate relationship of people with their environment. The main factors contributing to lifestyle diseases include bad food habits, physical inactivity, wrong body posture and disturbed biological clock. A report, jointly prepared by the World Health Organization (WHO) and the World Economic Forum, says India will incur an accumulated loss of $236.6 billion by 2015 on account of unhealthy lifestyles and faulty diet. Yoga is microcellular in its action. At the internal organs are massaged, sensitivity to insulin and uptake of sugar are enhanced. To observe the blood sugar level variation among practitioners and non-practitioners of yoga and propose yoga as a better method to manage blood sugar level in type 2 diabetics male. The study was conducted in 22 type-2 diabetics' male patients from various places in Chidambaram town, Tamilnadu were selected as subjects and they were divided into two equal group namely experimental and control groups. Than the yogic practices. The obtained data from the experimental and control groups, before and after the experimental period were statistically analyzed with analysis of covariance (ANCOVA). The level of confidence was fixed at 0.05 level for all the cases to test the significance. After intervention with yoga for eight weeks the study group showed a significant the reduction in blood sugar level from 168.45 to 138.55 mg/dl was however proved to be significant statistically. These findings suggest that blood sugar level of diabeties may benefit from yogic practice to reduce the blood sugar level. © 2020 All Rights Reserved

Abstract
The aim of this study was designed to find out the effects of varied yogasanas namely, Yogasana and pranayama on the selected biochemical variables. Sixty male students studying in the Department of Physical Education, Annamalai University were selected randomly as subjects and their age ranged between 22-28years. They were divided into three groups of twenty each. Group I served as Asana; Group II Pranayama and Group III as control. Yogasana and pranayama practices were given to experimental groups and control group was not given any exposure and were kept under control. Initial and Final data were collected on lipid profiles, cholesterol and triglycerides and statistically analyzed using ANCOVA and Scheffe's Post hoc test Results showed that Asana and Pranayama treatment moderates the lipid levels and influences antioxidant status of young healthy individuals. © 2020, Biochemical and Cellular Archives. Abstract
Objectives: The objective was to study the relationship of 3-Tesla (3T) diffusion-weighted magnetic resonance imaging (DW-MRI) with apparent diffusion coefficient (ADC) value for distinction of reactive and metastatic lymph nodes (LNs) in head-and-neck carcinoma (HNC) patients and to determine the ADC cutoff value for metastatic LNs at various levels. Materials and Methods: 3T DW and T1- and T2-weighted imaging sequences were done in 34 patients with biopsy-proven primary HNC of 100 cervical LNs ≥1 cm in diameter. The mean ADC values were compared with histopathologically proven LNs using the independent t-test. ADC cutoff value was evaluated with sensitivity, specificity, accuracy, positive predictive value, negative predictive value and a receiver operating characteristic curve analysis. Results: The mean ADC value of reactive LN was 1.2933 × 10-3mm2/s and metastatic LN was 0.908 × 10-3mm2/s. An ADC cutoff value was 0.868 × 10-3mm2/s with 84% sensitivity, 96% specificity, 93% accuracy, 87.5% positive predictive value, and 94.7% negative predictive value. A significant difference in mean ADC value between reactive and metastatic LNs was noted (P< 0.001). Conclusion: 3T DW-MRI is useful in differentiating reactive and metastatic cervical LNs in HNC patients. However, studies with larger sample size have to be performed to validate ADC threshold value with 3T DW-MRI in differentiating between reactive and metastatic LNs for clinical practice. © 2020 Wolters Kluwer Medknow Publications. Forebode: Forecasting based on dynamic truncated back propagation and enhanced L1 regularization

(2020) *International Journal of Advanced Research in Engineering and Technology*, 11 (4), pp. 206-218.

Abstract
The rapid proliferation demand of exploring the big data has urged the use of data-hungry algorithm like deep learning. Deep learning is one of the cornerstone technology behind emerging real-time applications include image and speech recognition, natural language processing, recommender systems, autonomous vehicles, etc. A notable consequence of development in such applications has been the capability of utilizing computing to better awareness and predict the evolution of weather data in prediction analytics. The great success of deep neural networks in the prediction analytics relies on the precise selection of neural network architecture with the optimal. As with the LSTM architecture, several research works have hypothesized the probabilities for forthcoming activities. By employing the back propagation technique, the LSTM model adjusts itself in proportion to the error signal while training the neural network to obtain optimal results. Despite, the back propagation becomes insignificant and makes the vanishing gradient issue when the back propagated error in the network acquires vanishingly smaller values in each layer. In addition, the LSTM enables the learning of complex representations of data that enhances the performance of the prediction model. Even though, escalating the complexity makes the system as more vulnerable to over fitting of data while training the neural network that degrades the prediction accuracy. To cope up with this constraint, this work presents the Forecasting Based On Dynamic truncated back propagation and Enhanced L1 regularization (FOREBODE) approach for prediction. It performed the prediction through the dynamic truncated back propagation and enhanced L1 regularization method. The dynamic truncated back propagation eliminates the vanishing gradient issue by selecting the back propagation time steps regarding the error function and deterministic weight. It allows the convergence of the system within a reasonable time. The enhanced L1 regularization method employs Particle Swarm Optimization (PSO) method to select the optimal features through the penalty term (λ) that helps to avert the over fitting of data even with the advent of recent data. The experimental framework illustrates that the FOREBODE approach surpasses the existing Anticipated Reweighted Truncated Back propagation (ARTBP) approach in terms of precision by 10.25%. © IAEME Publication Scopus Indexed

Abstract
This document exhibits the contrast of the diverse COP-PWM approaches on behalf of 7-level three-phase cascading Z-source inverter. Appropriate headed for switching arrangement redundancies, in attendance definite degrees of liberty to create the multiple levels of AC signal. This effort displays the utilization of CFD arrangement. This Z-source build on cascading MLIs are fried through the diverse COP-PWM approaches having sine signal and 3rd harmonic injection orientation by means of triangular wave carriers. It's detected to facilitate the COP-PWM-3 approach through sine orientation feed bargain less harmonics and COP-PWM-1 approach by means of 3rd harmonic injection feed enhanced RMS value on its AC output. The success of the PWM approaches urbanized with CFD be confirmed through MATLAB / SIMULINK. © IAEME Publication

Abstract
The Titanium dioxide–Carbon (TiO2–C) nanocomposite (NC) was fabricated by a hydrothermal method. The present work is to introduce the carbon material in Li-ion batteries for optimizing it to better electrical performance and to enhance its property. Lithium-ion battery is prepared by using titanium tetrachloride and commercial filter paper as the carbon source. The battery performance is highly influenced by the weight ratio of TiO2–C in the sample. For this work, a new method is adapted to tune the weight percentage of TiO2 and carbon in the composite while elevating calcination temperatures. Optimized battery performance of TiO2 nanocomposite was analyzed by 150 cycles at various calcination temperatures viz., 400 °C, 450 °C, and 500 °C, the charge capacities have existed at 301 mAh g−1, 352 mAh g−1, and 402 mAh g−1 at a current density of 100 mA g−1. The first discharge capacity was achieved for three prepared samples (400 °C, 450 °C, and 500 °C) to be 1068 mAh g−1, 1271 mAh g−1, and 1467 mAh g−1 at a current density of 100 mA g−1. The prepared electrode shows high charge and discharge capacity during long cycling. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

Withaferin-A Protects the Nigral Dopamine Neuron and Recovers Motor Activity in Aged Rats
(2020) *Cells Tissues Organs*, 208 (1-2), pp. 59-65. Cited 6 times.

Abstract
Withaferin-A (WA) was evaluated for its neuroprotective efficacy on the dopamine (DA) neurons of the substantia nigra (SN) and striatum (ST) in aged rats. Wistar albino rats were divided into group I, young (3 months old); group II, aged (24 months old); group III, aged rats supplemented with WA (50 mg/kg bodyweight once per day for 30 days), and group IV, young rats supplemented with WA (50 mg/kg bodyweight). At the end of the experiment period, the animals were subjected to various motor behavior analyses, and were sacrificed by transcardial perfusion. The brains were dissected out and subjected to various analyses, including histological, histomorphometrical, and immunolocalization of the tyrosine hydroxylase (TH) enzyme. The data of rotarod analysis ($p < 0.001$) showed a significant motor impairment in aged rats (number of falls 10.2 ± 0.86) and reduction in retention time (31.23 ± 2.56 s) compared to young controls (2.41 ± 0.35 and 84.05 ± 5.15 s). The stride length was significantly reduced ($p < 0.001$) in aged rats (4.21 ± 0.57 and 4.38 ± 0.61 cm) when compared to young control rats (6.98 ± 0.25 and 7.13 ± 0.70 cm). The histomorphometric data of the aged animals showed a significant reduction in the neuronal diameter ($p < 0.001$), density ($p < 0.001$), and volume ($p < 0.001$) in the SN of aged rats when compared to young rats. Immunohistology demonstrated a marked reduction in the levels of TH enzyme in both the SN and ST of aged animals when compared to young rats. Both structural and functional impairments were reversed in the aged animals after the supplementation of WA ($p < 0.001$). The present study clearly indicates that WA attenuates the ageing-mediated motor degenerative changes in the SN and ST of aged rats and ascertains its neuroprotective potential. © 2020 S. Abstract
A potent semiorganic third order acentric crystal Poly[μ-chlorido-heptachlorido-μ3-L-proline-μ2-L-proline-tetramercury(II)] (LPDMCl) with the chemical formula [Hg4Cl8(C5H9NO2)2]n was crystallized by slow evaporation in water and thereby its second and third order optical nonlinearities are explored using the technique of SHG powder test of Kurtz-Perry and Z-scan single beam respectively. The grown crystalline material was analyzed by single crystal XRD, which discloses the acentric space group P1 of the material with the crystal system of triclinic. From XRD analysis, the obtained peaks were indexed correlated to the orientations of (hkl) plane thus displaying the crystalline purity and perfection. FTIR spectrum detailed the diverse vibrational modes, which signifies the functional groups in LPDMCl. Surface topology of the crystallized salts was accomplished by the examination of SEM. Mechanical, dielectric, linear and nonlinear optical investigation were performed to affirm LPDMCl as an aspiring candidate in establishing proficient nonlinear optical and optical power limiting device for practical applications. © 2020 Elsevier B.V.

Abstract
Hard/soft SrCo0.02Zr0.02Fe11.96O19/MFe2O4 (M = Ni, Co, Cu, Mn and Zn) nanocomposites have been fabricated efficiently via one-pot sol-gel combustion route. The influence of different type of spinel were examined by XRD (X-ray diffraction), SEM – TEM (scanning and transmission electron microscopies) systems and VSM (vibrating sample magnetometer). The XRD investigation of Hard/soft nanocomposites revealed the tailoring between hexaferrite and spinel ferrite phases. Magnetization measurements (M vs. H) were performed at room (T = 300 K) and low temperature (T = 10 K) and diverse magnetic parameters comprising Ms (saturation magnetization), Mr (remanence), coercivity (Hc), and so on were determined. Smooth M vs. H curves and single peaks in dM/dH vs. H plots were observed for various prepared nanocomposites. The Henkel plots and maximum energy products were also determined and analyzed. Various prepared hard/soft nanocomposites indicated relatively high values of diverse magnetic parameters. Diverse findings disclosed the incidence of exchange-coupling spring behavior among various soft and hard magnetic phases. Measurements of ZFC-FC magnetizations showed the existence of a peak temperature values, which are largely ascribed to competition between the motion of magnetic domain walls and thermal activations. It is revealed that one-pot sol-gel combustion route is valuable to attain strong exchange coupling among hard and soft nanoparticle phases grown near to each other. The obtained findings indicated that these nanocomposites are promising candidates for numerous practical applications. © 2019 Elsevier B.V.

Author Keywords
Exchange coupling; Hard-soft ferrites; Hexaferrites; One pot synthesis; Sol-gel auto-combustion; Spinel ferrites

Abstract
In this present study, semiconductor magnetic α-Fe2O3/MnO2 nanocomposites (NCs) were prepared by a facile hydrothermal (HT) method. The crystallographic structure, morphology, chemical configuration and magnetic features were analysed by X-ray powder diffraction (XRD), high resolution scanning electron microscope (HR-SEM), energy dispersive X-ray analysis (EDX), transmission electron microscope (TEM), Fourier transform infrared spectroscopy (FT-IR), X-ray photoelectron spectroscopy (XPS) and vibrating sample magnetometer (VSM) analyses. The as-prepared NCs were used as an electrode in energy storing supercapacitor was systematically examined. The electrochemical deeds of α-Fe2O3/MnO2 NCs was analysed by cyclic voltammetry (C–V) and galvanostatic charge–discharge (GCD) tests. The CV analysis of the NCs electrode showed a distinctive pseudocapacitive behaviour in 1 M KOH solution. The NCs electrode reveals enhanced specific capacitance compared to plain α-Fe2O3 and MnO2 nanoparticles (NPs) and generates high specific capacitance of 216.35 Fg−1. Pseudocapacitor obtains of energy density 135.42 Wh kg−1 at power density of 6.399 kW kg−1, indicating the as-prepared α-Fe2O3/MnO2 NCs shows noteworthy high-energy, specific capacitance, power densities and long-standing cyclic stability with 89.2% of preliminary capacitance reserved at 1A g−1 after 10000 cycles in judgement with the pure α-Fe2O3 and MnO2 NPs electrode. The α-Fe2O3/MnO2 NCs electrode having noteworthy electrochemical characteristics performance renders promising applications in energy storing systems. © 2019 Elsevier Ltd and Techna Group S.r.l.

Abstract
Novel series of quinoline-2-carboxamide based chalcone derivatives (5a–g) have synthesized and characterized using 1H-NMR, 13C-NMR, Mass, and elemental analysis. In-silico molecular docking studies exhibited that synthesized compounds 5a and 5g are good binding energy (−8.46 kcal and −9.46 kcal) toward the essential requirements of targeted compounds for EGFR receptor-bearing quinazoline inhibitor (PDB ID: 1M17(Lapitinib)). UV-Vis and fluorescence spectroscopy measurements provided a significant effect on the absorption, emission cyclic voltammetry (CV), and highest occupied molecular orbital (HOMO). Lowest unoccupied molecular orbital (LUMO) values of compound 5g are also confirmed band along with intramolecular charge transfer character (D-π-A). The red shift maxima (510 nm) the emission spectra in various solvents with increasing solvent polarity. © 2020, © 2020 Taylor & Francis Group, LLC.

Antistressor effect of Costus speciosus on noise-induced changes in antioxidant level in the cerebral cortex of brain

(2020) *Drug Invention Today*, 13 (3), pp. 88-91.

[a] Department of Research and Development, Bharath Institute of Higher Education and Research, Chennai, Tamil Nadu, India

Abstract
Background: Plants have an inborn ability to biosynthesize an extensive range of enzymatic and non-enzymatic antioxidants and able to attenuate reactive oxygen species -induced oxidative damage. The present study aimed at analyzing the potential effect of Costus speciosus extract on the altered antioxidant level in subacute noise stress-induced alterations in the cerebral cortex of rats. Methodology: The rats were exposed to subacute noise stress, and the effect of ethanolic C. speciosus extract on enzymatic and non-enzymatic antioxidant parameters (such as superoxide dismutase [SOD], catalase [CAT], malondialdehyde [MDA], glutathione [GSH], and GSH peroxidase [GPx]) was studied. Results: Subacute noise stress significantly increased the activities of SOD and MDA levels while reduced the activities of CAT and GSH levels in cerebral cortex region. Treatment with CSE extract decreased the elevated activities of SOD and MDA levels and increased the activities of CAT, GPx, and GSH levels. Conclusion: The study concluded that the stress conditions may alter the cell redox equilibrium, thus influence the antioxidant response in brain cortex. The results proved that CSE was effective in producing significant antistress effects in rats due to its improvement in antioxidant levels. © 2020 JPR Solutions. All rights reserved.

Abstract
Background: This study was conducted among healthy adolescents to assess the effects of a yoga breathing practice (Bhramari pranayama, Bhr.P) towards cardiac autonomic function using heart rate variability (HRV) parameters. Methods: Of the 730 eligible subjects screened, 520 healthy adolescents who met the inclusion and exclusion criteria were randomly assigned to either yoga breathing group (n = 260) or control group (n = 260). The yoga breathing group practiced Bhr.P. five days a week for a duration of six months while the control group continued with their daily routine without any intervention. Outcome measures were time and frequency domain of HRV in both groups which were assessed before and after the intervention using Lead II ECG. Linear models were used in the analysis of short term HRV. Results: After 6 months of yoga breathing, the time domain parameters of short term HRV showed significant ($P < 0.05$) improvement towards the parasympathetic domain. Frequency domain parameters also showed the same direction of changes. In contrast, control group subjects showed a trend towards a sympathetic domain. Conclusion: The present study showed a positive shift in cardiac autonomic modulation towards parasympathetic predominance after 6 months of yoga breathing practice among apparently healthy adolescents. © 2020

An efficient incident recovery based information security model using fuzzy rough sets for green business environment

(2020) *Journal of Green Engineering*, 10 (3), pp. 811-826. Cited 2 times.

[a] Department of Computer Science and Engineering, Saveetha School of Engineering, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract
The objective of the work is to propose a fuzzy rough set based incident response plan with attack modeling and verification technique encompassing the information assurance in green business environment. Developed or gathered data about the current or past security incidents in business forms are to be recognized for conveying right security systems. The accuracy of the current data and the accentuation of the past data identified with security are officially used to foresee the truth of future data security occurrences in a business situation. The accentuation on different fragments of the data is investigated according to the fuzzy data in regards to the assaults and their effects. The fuzzy result and lament lattices desire and their relative weightages in different event responds action with business forms are quantitatively displayed to take a right choice with the proposed with Time Contiguity Anxious Logic (TCAL) tense validation. The hopeful green security system is distinguished when numerous business forms with various truth factors are teamed up. The intelligent sequent math with its methods is applied to implement the best option of information assurance and its security activity to defend any attack towards business environment. © 2020 Alpha Publishers. Abstract

Zinc oxide (ZnO) thin films were deposited on Si (1 0 0) and glass substrates by sol-gel spin coating technique. Zinc acetate dihydrate, monoethanolamine and isopropanol were used as the sources for precursor solution and the resulting gel was used for the preparation of ZnO thin films. The films were annealed at different temperatures (100 °C to 500 °C) and the effect of annealing on the structural and optical properties was investigated. X-ray diffraction (XRD) and UV-Vis spectroscopy were used for the analysis of the films. The XRD results indicated the polycrystalline hexagonal structure of the ZnO films with (0 0 2) orientation. The optical properties of the films were studied using UV-Vis spectrophotometer in the wavelength range of 190-1100 nm. The optical characterization of the ZnO thin films showed the high transmittance of ~90 % for the films annealed at 400 °C. The films showed the absorbance ~360-390 nm and bandgap values of 3.40-3.10 eV, depending on the annealing temperature of the films. © 2020 G Balakrishnan et al., published by Sciendo.

Abstract
Employee Work Life Balance (WLB) is a prime driver in the corporation that helps to achieve better productivity. It is a healthful blend of both employee's paintings life and personal life. There are many factors influencing work-life balance of an worker in the employer. The researchers have diagnosed some factors at the side of demographic variables to study and apprehend the paintings life stability. The goal is to examine the connection among Work Life Balance (WLB) and observe factors. To have a look at the affiliation between demographic variables of respondents and employee paintings-life balance; to have a look at the variant between the demographic factors and worker paintings-life stability; to take a look at the impact of person factors on worker paintings-life balance; to study the association among worker work-life balance and outcome variable viz., employee satisfaction and retention and to recognize the effect of employee work-life balance on worker satisfaction and retention as final results variable. © 2020 IAEME.

Smart biofeedback expectorant system for improving the lung capacities
(2020) *International Journal of Advanced Research in Engineering and Technology*, 11 (3), pp. 240-248.

DOI: 10.34218/IJARET.11.3.2020.021

[a] Department of Biomedical Engineering, Bharath University, Chennai, Tamilnadu, India
[b] Department of Medical Lab, Majmaah University, Majmaah, Saudi Arabia

Abstract
The Biofeedback Expectorant is a device which is designed for patients suffering from various lung disorders, associated with the production and secretion of excessive quantities of mucus within the airways and help to loosen the mucous so that it tends to be hacked from the lungs. Meanwhile, the mucous in the lungs becomes thick and difficult to wash out from the air routes. When this mucous remain in the air routes, it blocks airways and becomes hard to relax. The disease is likely to be conceivable if the mucous remains permanently in the air routes. When one breathes out through this device, it bounces the ball inside to it. This action produces signals around 15 Hz and forward the vibration via the air ways. This amalgamation of enhanced intensity and vibration AIDS the mucous in moving into the air ways where it remains. Some patients can't blow for a longer duration, therefore a feedback system is designed in such a way that the pressure is measured using a pressure sensor. If the value goes below the certain threshold limit the beep sound is heard and a light indication is provided so that we can find whether the patient should blow effectively. The Blowing time (how much time duration the patient is blowing) was measured and display in the LCD screen. The forced expiratory flow volume (FEV1) and Peak Expiratory Flow Rate (PEFR) was calculated that gives an idea about the status of the lungs. The Mann Whitney U Test was conducted with $\alpha = 0.05$ for the sampled data, the results show that the data is statistically significant. This device is small, portable, and easy to use with no side effects. © 2020 IAEME.

Abstract
The present work is focused on the synthesize of MgO nanoparticles using combustion method. The magnesium nitrate is used as a precursor with urea as a fuel. The precursor material is dissolved in 50 ml DI water along with the fuel and the solution is heated at 80 °C for 2 h. Then, the solution is transferred to crucible and kept it in the temperature of 500 °C. The as-synthesized MgO nanopowders are analyzed using X-ray diffraction (XRD), Fourier transform infrared spectroscopy (FTIR), Field emission scanning electron microscopy (FESEM), photoluminescence (PL) and photocatalytic studies. The XRD results of MgO nanoparticles indicated the cubic structure with the crystallite size of 27 nm. The FESEM studies indicated the formation of MgO crystallites in spherical shape. In addition, MgO nanoparticles are porous and agglomerated. PL spectrum of MgO materials exhibit emission peaks, which indicates the occurrence of band to band transition with the bandgap of 2.9 eV. The photocatalytic degradation of methylene blue dye is evaluated using the as-prepared MgO nanoparticles under UV light. The photocatalytic studies indicate the 75% degradation efficiency of the catalyst after 120 min irradiation. Hence, the MgO Nanoparticles (NPs) can be used for the treatment of effluents from the dye industries. © 2020

Abstract
Superconducting composite products of type YBa2Cu3O7−d (noted Y-123) added with different contents (x wt.%) of tungsten oxide nanoparticles (WO3 NPs), x = 0.0–1.0 wt%, were produced via the standard solid-state reaction technique. Samples were investigated by X-ray diffraction (XRD), scanning electron microscope (SEM) and electrical resistivity measurements. XRD examination showed that the Y-123 orthorhombic structure is not altered by WO3 NPs additions. SEM observations indicated a reduction in the grains size with the increase of nanoparticles content. The investigation of the excess conductivity of different prepared composites was analyzed using Aslamazov-Larkin (AL) model. The investigated samples comprised of five distinct fluctuation regimes, namely short-wave (SWF), one-dimensional (1D), two-dimensional (2D), three-dimensional (3D), and critical (CR) fluctuations regimes. The coherence length along c-axis at zero-temperature (ξc(0)), lower and upper critical magnetic fields (Bc1 and Bc2), critical current density (Jc) and numerous other superconducting parameters were estimated with respect to WO3 NPs content. Compared to undoped Y-123 sample, it was found that an amount of x = 0.05 wt% of WO3 NPs is appropriate to improve the physical performances of Y-123, whereas with further increasing x, these performances were weakened. © 2020 Elsevier B.V.

Abstract
Solid polymer electrolytes used in energy storage devices based on Cornstarch and Poly (vinyl Pyrrolidone) blend incorporated with lithium acetate was prepared using the solution casting method. XRD results confirmed that the amorphous nature of the as-prepared polymer electrolyte was increased by addition of salt. 80 wt % Cornstarch/20 wt % PVP/60 wt % lithium acetate added polymer blend system attains better amorphous nature than others. At ambient temperature, 60 wt % of lithium acetate added system has better bulk conductivity of 3.52 × 10−5Scm−1 over the frequency range of 42 Hz to 1 MHz using AC impedance spectroscopy studies. The dielectric analysis is confirmed that the higher conducting sample was having high dielectric constant and low relaxation time for enhancing ions dynamic behaviour. The conduction mechanism of the higher conducting polymer electrolyte is explained by small polaron hopping and overlapping large polaron tunnelling conduction mechanism. From the argand plot, it is confirmed that higher conducting sample has low relaxation time. © 2019 Elsevier B.V.

Abstract
A drug undergoes several in silico, in vitro, ex vivo and in vivo assays before entering into the clinical trials. In 2014, it was reported that only 32% of drugs are likely to make it to Phase-3 trials, and overall, only one in 10 drugs makes it to the market. Therefore, enhancing the precision of pre-clinical trial models could reduce the number of failed clinical trials and eventually time and financial burden in health sciences. In order to attempt the above, in the present study, we have shown that aortic ex-plants isolated from different stages of chick embryo and different regions of the aorta (pulmonary and systemic) have differential sprouting potential and response to angiogenesis modulatory drugs. Aorta isolated from HH37 staged chick embryo showed 16% ($p < 0.001$) and 11% ($p < 0.001$) increase in the number of tip cells at 72 h of culture compared to that of HH35 and HH29 respectively. The ascending order of the number of tip cells was found as central (Gen II), proximal (Gen I) and distal (Gen III) in a virtual zonal segmentation of endothelial sprouting. The HH37 staged aortas displayed differential responses to pro- and anti-angiogenic drugs like Vascular endothelial growth factor (VEGF), nitric oxide donor (spNO), and bevacizumab (avastin), thalidomide respectively. The human placenta tissue-culture however evinced endothelial sprouting only on day 12, with a gradual decrease in the number of tip cells until 21 days. In summary, this study provides an avant-garde angiogenic model emphasized on tip cells that would enhance the precision to test next-generation angiogenic drugs. © 2019

Abstract

Magnesium oxide (MgO) nanoparticles are one of the highly significant compounds in construction. The novelty concentrated on using sol–gel technique coupled with ultrasonication for synthesis of MgO nanoparticles to prevent the agglomeration and its effect on the size was investigated. The synthesized samples were characterized by TGA, DSC, XRD, FTIR, SEM, EDX mapping, DLS, and HRTEM. Antimicrobial and antibiofilm activities of MgO nanoparticles were investigated against multidrug-resistant microbes causing-urinary tract infection (UTI). TGA, XRD, and FTIR characterization were used to identify the calcination temperature, characterization peaks, and functional groups of MgO nanoparticles, respectively. DLS technique confirmed the particle size distribution which found to be 21.04 nm. HRTEM and SEM/EDX mapping showed that MgO nanoparticles are pure, spherical and the average particle size is 19.2 nm. MgO nanoparticles showed a promising antimicrobial effect against all UTI-causing pathogens. It showed a prominent antimicrobial capability against Staphylococcus aureus, Escherichia coli and Candida albicans by 19.3 mm, 16.1 mm and 15.2 mm ZOI, respectively. Additionally, they showed improved biofilm inhibition as 95.65%, 84.23%, and 76.85% against C. albicans, E. coli and S. aureus, respectively. Therefore, due to these outstanding properties, this study could give insights for solving serious industrial, pharmaceutical and medical challenges throughout the utilization of new nanoparticle-based approach. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

Influence of seasonal variation on incidence and population dynamics of whitefly (bemisia tabaci) on Brinjal
(2020) *Plant Cell Biotechnology and Molecular Biology*, 21 (1-2), pp. 28-32.

[a] Department of Agricultural Science, Bharath Institute of Higher Education and Research, India
[b] Department of Agriculture, Faculty of Agriculture, Annamalai Unversity, India

Abstract
A field trial was carried out to study the influence of seasonal variation on the incidence of whitefly (Bemisia tabaci) on brinjal at Vallampadugai village during 2017 during the Rabi and Kharif seasons. Seasonal incidence of whitefly coincided with various vegetative stages and throughout the crop period. Correlation studies showed that temperature was positively correlated with the incidence of whiteflies, whereas rainfall and relative humidity were not-significant during January- April 2017 (First Season). During the second season, the temperature was positively correlated with whitefly numbers during the July-October 2017 period. Among all the meteorological factors, the maximum temperature played a significant role with (0.440) followed by minimum temperature (0.392). In the second season Brinjal crop significant positive correlation with temperature (0.378) and R.H (0.311) was recorded. In both seasons rainfall showed a significant negative relationship. However, whitefly incidence was lower during the first season (Rabi) compared to the second season (Khairf) due to variation in weather factors. © 2020 Society for Biology and Biotechnology. Free radical scavenging potential of Argyreia nervosa leaf extract: An in vitro analysis
(2020) *Drug Invention Today*, 13 (2), pp. 247-251.

[a] Departmentof Physiology, Bharath Institute of Higher Education and Research, Chennai, Tamil Nadu, India

Abstract
Background: Argyreia nervosa (AN) belongs to the family Convolvulaceae, used in Ayurvedic medicine, and has immense remedial values. Aim: The aim of the study was to evaluate the in vitro antioxidant activity of AN. Materials and Methods: AN ethanol extract prepared and examined for their antioxidant potential by 2,2-Diphenyl-1-picrylhydrazyl (DPPH), superoxide radical scavenging, DNA sugar damage, and ferric reducing antioxidant power methods. Results: The antioxidant activity of AN extract was found to be a high value at the concentration of 150 µg/ml compared to 50 and 100 µg/ml concentrations. DPPH free radical, nitric oxide, and superoxide anion radical scavenging assays showed strong antioxidant activities with an increase in the concentration of ethanol extracts of AN. Conclusion: The present in vitro study clearly shows that the ethanolic extract of AN has the potential free radical scavenging activity due to its antioxidant capacity and hence it can be used as one of the medicinal herbs against various diseases including against liver toxicity. © 2020 JPR Solutions. An analysis of antiasthmatic preparations available in Indian market

(2020) *Research Journal of Pharmacy and Technology*, 13 (2), pp. 624-626.

DOI: 10.5958/0974-360X.2020.00118.3

Abstract
Objective: To analyse various anti-asthmatic preparations available in the Indian market and to study their cost effectiveness and rationality of drug preparations. Materials and methods: Various formulations which is used for asthma mentioned in Current Index of Medical Specialities (CIMS) (2018) were noted down. Their rationality and irrational combination of drug preparations were recorded as per Drug Controller General of India (DCGI) (2018). Moreover they are classified into number of ingredients present in each preparation, type of dosage forms, different pharmacological groups to which they belong and cost analysis of the anti-asthmatic preparations. Results: Among 598 preparations which has been analysed, 360 (60%) were fixed dose combinations (FDC). Out of 360 FDC, 250(42%) preparations were of irrational formulations. Preparations were categorised into different pharmacological groups like expectorants (18.73%), antihistamines (17.22%), beta 2 adrenergic agonists (50.17%), mucolytics (20.57%), cromones (1%), methylxanthines (16.38%), corticosteroids (24.08%), antileukotrienes (23.91%), anticholinergics (3.85%).187 preparations were inhalants and 10 of the preparations were nasal formulations. Solid formulations (244) are more when compared to other formulations and liquid oral formulations are costlier. Conclusion: Many of the drugs which was considered as irrational by DCGI is still available in Indian market and it is widely used by the people. This indicates the poor governance in the pharmaceutical sector. Through proper awareness and education to the pharmacist, physician and patient this problem could be solved. Moreover it also leads to the wasteful expenditure and effectiveness of the drug is also questionable. © RJPT All right reserved.

Abstract
In this paper, we present a novel methodology for evaluating job applicants in online enrolment frameworks, utilizing AI calculations to take care of the candidate positioning issue. A use of our methodology is actualized as a model framework, whose usefulness is displayed and assessed in a true enlistment situation. The Internet gives immense chances to people to introduce themselves in various manners, from basic self-improvement to vindictive personality misrepresentation. We regularly depend on our Internet-based decisions of others to decide, for example, whom to associate with, date, or utilize. An assortment of methodologies has been as of late proposed to consequently derive clients' character from their client produced content in online networking. Methodologies vary as far as the AI calculations and the capabilities utilized, kind of used impression, and the web based life condition used to gather the information. In this article, we layout the systems basic human-and PC based character expectation and portray how future research could address ebb and flow confinements. We start by thinking about what character is and what "precise" truly implies. © 2020 IJSTR.

Abstract
In this business field, the growth of online stores makes competition harder. Online stores need to have a website or application ready to calculate and classify consumer spending intentions, so customers will ultimately have an eye on things on the sites and applications to make purchases. Fuzzy Petri networks are dominant features as they cover the efficiency and inaccuracy management of sometimes the software field. Researchers use this tool to encode the processing results achieved. Data mining helps sell professionals to improve their consumer behavior understanding. This higher perceptive, in effect, helps them to concentrate on mercantilism campaigns with specific precision and match campaigns with shoppers and prospects, preferences, desires, and attitudes. Fuzzy Petri networks and classification mining methods are enforced data on intention online shopper victimization throughout this paper. © IJSTR 2020.

Abstract
Technology framework for secured and tamper free authentication mechanism of identity and verification of transactions over the network in cash logistics industry using IOT to avoid identity thefts and cash robberies during the storage, transportation, handling and dispensing of cash. This paper presents a comprehensive and a fundamentally new way to transact business. The whole process flow of the cash logistics with the security based authentication factors of and methods to control cyber security threats over the cash logistics network. Here in this paper I have utilized cryptographic security, decentralized agreement, and a mutual open record (with its appropriately controlled and permissioned perceive ability), Blockchain advancements which can significantly change the manner in which it sort out the monetary, social, political, and logical exercises. © 2020 IJSTR.

Abstract
In present day period of information technology most association have understood that human resource is significant for their hierarchical advancement, anyway the recruiting system has grown quickly and come to the for-most degree of e-recruiting process however there is a risk of ERecruitment Frauds (ERF), counterfeit profiles, counterfeit resumes, counterfeit recognizable proof card, counterfeit visa, and phony meetings etc..By this impression the ineligible applicants are set in a decent association. So as to maintain a strategic distance from these predefined disadvantages, this paper presents the selecting procedure dependent on Block chain. This Block chain innovation which look at the first information of the up-and-comer and give exact outcome to the enrolling procedure by utilizing data mining, There are additionally numerous sites where recruiters can purchase a whole database of CVs that fit their hunt criteria. Candidate data has turned into the currency of the recruitment business. Generally, this is without the consent or even the learning of the candidates themselves. To prevent such procedures, the European Union (EU) has presented the General Data Protection Regulation (GDPR). By utilizing various devices and web search tools keeping Blockchain has primary zone of capacity, we can easily scrape the web for CVs and email addresses of potential candidates. The magnificence of Blockchain is that organizations can recover verified candidate data while keeping it unknown and holding fast to information protection guidelines. © 2020 IJSTR.

Abstract
In this article,Minimum Domination energy value and Minimum neighborhood energy value of Benzoxepine derivatives has studied. By using these derivatives are useful intermediates for the synthesis of many natural products and biologically active molecules. These molecules are an essential objective in modern organic synthesis. © IJSTR 2020

Abstract
Ovarian cancer (OC) is one of the deadliest cancers among women contributing to high risk of mortality, mainly owing to delayed detection. There is no specific biomarker for its detection in early stages. However, recent findings show that over-expression of specificity protein 1 (Sp1) is involved in many OC cases. The ubiquitous transcription of Sp1 apparently mediates the maintenance of normal and cancerous biological processes such as cell growth, differentiation, angiogenesis, apoptosis, cellular reprogramming and tumorigenesis. Sp1 exerts its effects on cellular genes containing putative GC–rich Sp1–binding site in their promoters. A better understanding of the mechanisms underlying Sp1 transcription factor (TF) regulation and functions in OC tumorigenesis could help identify novel prognostic markers, to target cancer stem cells (CSCs) by following cellular reprogramming and enable the development of novel therapies for future generations. In this review, we address the structure, function, and biology of Sp1 in normal and cancer cells, underpinning the involvement of Sp1 in OC tumorigenesis. In addition, we have highlighted the influence of Sp1 TF in cellular reprogramming of iPSCs and how it plays a role in controlling CSCs. This review highlights the drugs targeting Sp1 and their action on cancer cells. In conclusion, we predict that research in this direction will be highly beneficial for OC treatment, and chemotherapeutic drugs targeting Sp1 will emerge as a promising therapy for OC. © 2020 by the authors. Abstract
Urea Glutaric acid (UGA), an organic compound was grown and its diverse characterizations were studied. XRD results confirmed the structure as monoclinic with the space group of C2/c. FTIR results confirmed the basic functional groups present in crystal was noticed. The optical properties have been studied by absorbance measurements in the wave length region from 200 nm to 800 nm. NLO (third order) properties were studied by Z- Scan method declares UGA, a successful material in nonlinear optics. The fluorescence spectrum indicates an electronic excitation at 481 nm and its thermal studies was done to determine the stability of the grown material under decomposition. Laser damage threshold was calculated to predict its resistance for high power laser radiation. The hardness and dielectric properties of UGA was explained from Vicker's micro hardness and dielectric analysis. Hence, the results from various characterizations confirmed that UGA is an enticing aspirant over device fabrication in nonlinear optics. © 2019 Elsevier B.V.

Author Keywords

Abstract
Muntingia calabura is a medicinal plant broadly used in conventional therapeutic preparation of many pharmacological activities. In the present study, the Invitro antidiabetic property of Muntingia calabura leaves extracts was analyzed by using standard methods. An in vitro anti-diabetic study was done by inhibition of α-amylase and α-glucosidase enzymes. The phytochemical screening of Muntingia Calabura leaves revealed that the extract is rich in the secondary metabolites such as alkaloids, polyphenols and tannins. The in vitro antidiabetic capability of extracts such as Petroleum ether, Chloroform, Methanol and aqueous through α-amylase enzyme and alpha-glucosidase enzyme inhibition studies. The results of the present study concluded that the methanolic extract of Muntingia calabura exhibits 80% in α-amylase and 60% in alpha-glucosidase activity while compared to acarbose. The phytochemistry study portrays the antidiabetic activity of Muntingia calabura is due to the presence of polyphenols. © 2020, J. K. Welfare and Pharmascope Foundation. All rights reserved.

Abstract
"Mesenchymal Stem cells (MSCs)" are distinct type of cells naturally present in the body that has the ability to separate into any cell type like bone, cartilage, muscle, nerve, tooth etc. There are numerous studies available to efficiently isolate culture, characterize and expand the bone marrow mesenchymal stem cells. Similar such method was utilized to isolate the MSCs from femoral and tibial bone of female wistar rats and the standardized method was used to culture and expand MSCs. The cultured cells were determined to be MSCs with their hallmark properties of spindle shape morphometry, cellular plasticity & cell adherence property. The cells after expansion were subjected to flow cytometry analysis for characterization. The BMSCs showed positive expression for CD90 & negative expression for CD34. In the present investigation, we obtained the BMSCs that would have potential clinical significance as it was performed in a GMP environment with all necessary requirements that could enable its therapeutic value. © 2020 International Journal of Research in Pharmaceutical Sciences. Abstract
The purpose of this study is to employ a novel technique for the fabrication of natural fiber reinforced polymer composites that could stand toe to toe with glass fiber composites in terms of thermo-mechanical properties without any chemical treatment. The reinforcement fibers were extracted from the pseudostem of the nendran banana plant. Later a non-woven fabric composite consisting of banana fibers reinforced with unsaturated polyester (UPE) matrix was fabricated using the needle punching technique. Composite specimens were subjected to tensile, flexural, hardness, quasi-static indentation (QSI) and dynamic mechanical analysis (DMA) test for evaluating mechanical properties. However, the optimal properties was achieved at 40 wt% fiber content with an increase in tensile and flexural strength of 36% and 33% for needle-punched banana fiber composites (NPBFC) compared with random banana fiber composites (RBFC) respectively. It was also evidenced from the load bearing capacity and hardness of NPBFC having 2420 N and 87 HRRW, proves its superiority over RBFC and comparable with RGFC. Further, the viscoelastic properties of UPE and NPBFC were analyzed. Subsequently, the characteristic bonds of cellulose were represented through infra-red spectroscopy and the crystallinity index was exposed through X-ray diffraction analysis. In addition, thermal analysis was done and the stability of the optimized NPBFC witnessed was up to 260 °C. Also, morphology-properties correlation was established. Finally, the experimental results were validated using theoretical models. This study concludes that the synthesized novel NPBFC endorses its potentiality as a probable reinforcement in industrial safety helmet, automotive door panel and light weight structural applications. © 2019 Elsevier Ltd

Abstract
Diffusion bonding is the joining of two or more similar or dissimilar pieces of metals combined under pressure at elevated temperatures for a specific time. During the period, atoms diffuse between the two metals across the interface. The energy needed for the atomic movement entirely dependable on the stress applied and temperature. This is also extensible to non-metals, ceramics and intermetallic Compounds (IMC's). The traditional method of fusion state welding processes have some disadvantages such as the production of less heat affected zone, distortion of the base metals etc. In the present investigation, 7075 Al and AZ80 Mg alloys combined together which the effects of holding time and holding temperature are related to diffusion and are being studied for mechanical and metallurgical properties. Henceforth, the morphologies were found by optical microscopy and SEM (Li et al., 2009) [1]. Zinc coated AZ 80 magnesium combination and AA 7075 aluminum amalgam were treated to receive the preliminaries of diffusion bonding for various process parameters (Pragatheswaran et al., 2019) [10]. A bonding temperature of 350 to 450°C, a bonding pressure of 2MPa to 25MPa and a holding season of 5min to 150min resulted in a dispersion between the zinc coated AZ80 Magnesium/AA7075 Aluminium alloys (Pragatheswaran et al., 2019) [10]. It can be noted that for the zinc coated samples the lower temperatures of 325°C resulted in non-bonded layer and similarly at lower pressure of 2MPa and lower time duration resulted in non-bonded layer whereas for non-coated and zinc coated layer of lower temperature resulted in better bonded nature. © 2020 Elsevier Ltd. Evolution of numerical model to identify the intersection of vibratory motion equations with discrete points in a mechanical system

(2020) *Materials Today: Proceedings*, 45, pp. 6718-6723.

DOI: 10.1016/j.matpr.2020.12.482

Abstract
Some mathematical functions which can't be solved analytically and the solution for these functions can be determined by the intersection of their graphical plots. Computer programmes represent these functions with discrete points which are not continuous in nature. Since the resolution of the discretization is limited, the graphs may intersect in the interval between two points. It is difficult to find the intersection value of these functions from the computer plotted graphs as the intersection points do not exist. In such cases, intersection points can be approximately found by eye ball method, or by increasing the number of discrete points. This paper discusses about a logical method to find the intersection points of two discretely plotted graphs with much better accuracy. Novelty of this work is the improvement in the accuracy and resolution of determination of intersection points between two discretised graphs without increasing the resolution of discretisation. Existing methods requires increasing the number of discretised points to improve the accuracy and resolution in the determination of intersection points. A problem related to simulation of vibratory induced motions is taken as an example. © 2020 Elsevier Ltd. All rights reserved.

Techno-economic assessment of various motors for three-wheeler E-auto rickshaw: From Indian context
(2020) *Materials Today: Proceedings*, 45, pp. 6572-6579.

DOI: 10.1016/j.matpr.2020.11.711

Abstract
Three-wheeler auto-rickshaws form a major part of the public transportation sector in developing countries like India, as they provide cost-effective and convenient mobility. Switching to electric auto-rickshaws will significantly reduce emissions besides being cost-effective. Also in contrast to the gas powered vehicles, electric auto rickshaws for public transport aid a big aid to the national economy by benefitting the power grids, PSUs & customers. The central feature for an E-auto rickshaw besides batteries that replaces an IC engine is an electric motor. The rapid advancement of power electronics and respective control technology has created a room in which various types of electric motors can be used for Electric Vehicles (EV). For choosing a right motor for an electric vehicle, one has to primarily consider the performance, operating conditions, efficiency, relative costs and so on. For Electric vehicles like three wheel auto rickshaws covering short-range driving cycle, a low-weight, high power density, and affordable motor must be conceptualized in terms of their functionality and economic feasibility from the Indian context. The ultimate intent of this present research work is to identify the characteristics for a range of motors and to determine their attributes that are optimal suited for large-scale deployment of electric auto-rickshaws in the Indian transport scenario. © 2020 Elsevier Ltd. Abstract
Enzymes in industrialized catalysts have remarkable potentials as their fabrication is easy and every substrate has its distinct enzyme. Compared to organic materials, inorganic nanomaterials provide exclusive support to enzymes, as well as high resistance to microbial corrosion, better reusability and high enzyme stability. Due to the easy recovery of the product and substrate, the chosen enzyme immobilization and magnetic nanoparticles (MNPs) are the most universally known carriers of proteins / enzymes among the inorganic nano-materials. A more complicated overview of the applications and recent advances of cellulase (CL) enzyme immobilization on different functionalized MNPs was addressed in this article. In addition, in various fields such as enzyme reusability, superficial rescue method of CL, and the capable development of biotechnology method, an effort to exercise the future perspective of the research scope. © 2020, Advanced Scientific Research. Abstract
Hybrid composite which is made up of bio fibre woven mat and fibre could be an eco friendly alternative for the conventional materials. In this work, two variants of hybrid composite materials which is a combination of Bamboo fibre woven mat, Aloe Vera fibre Woven mat, and Sisal fibre with epoxy as resin and another two sets of hybrid composites of Sisal fibre with Flax mat and Aloevera mat are prepared by hand laying method having the fibre mats in different positions. The prepared ASTM standard specimens are analysed to measure the unique changes in the features of 4 sets of hybrid composite materials in various combinations, the tests under tensile and flexural loads, water absorption and Hardness are carried out. Mechanical characteristics of the prepared test specimens are evaluated by conditioning the specimens in standard atmospheric condition. As a result, it is understood that to vary the characteristics and performance of hybrid composites, the proper identification and utilisation of bio fibre mats and its arrangement variation plays a vital role. © 2020 Elsevier Ltd.

Abstract
Vibration measurement is essential for the study and testing of vibrating members, condition monitoring of industrial machines and control of vibration. Accelerometers are preferred for vibration measurement because it is compact size and the other two parameters velocity and displacement can be obtained by method of integration. Conventionally piezoelectric accelerometers are used for vibration measurements. Presently new generation of MEMS accelerometers are available in the market with numerous advantages like miniature in size, low cost, wireless transmission of signals. The purpose of this paper is to evaluate the MEMS based accelerometers and to guide the user to select a proper MEMS accelerometer for vibration measurement. The performance and suitability for vibration measurement of three MEMS based accelerometers, two commercially available and one MEMS Accelerometer present in a smart phone are compared with a conventional piezoelectric accelerometer taken as reference. © 2020 Elsevier Ltd. Abstract
This paper presents the stability analysis of a high gain interleaved converter by small signal modeling. The proposed converter fuses the features of both interleaved boost converter and high gain converter. Considering the specifications of the parameters used and depending on state-space averaging technique, the transfer function is derived. The stability assessment of the proposed converter is analyzed using bode plot and root locus plot of the transfer function derived. The response of the converter is validated experimentally using hardware prototype model of 800 W. The investigation provides useful information in designing a perfect controller for line and load regulation. The simulation and experimental results prove the efficacy of the proposed converter. © 2020 Editura Academiei Romane. All rights reserved.

Abstract
The present random group experimental study was designed to find out the effect of yoga therapy with Varma therapy practices on systolic blood pressure and diastolic blood pressure variables among hypertensive middle aged men. It was hypothesized that there would be significant difference in yoga therapy with Varma therapy practices than the control group on systolic blood pressure and diastolic blood pressure variables among hypertensive middle aged men. To achieve the purpose of the study, thirty (30) hypertensive middle aged men residing in chennai age between 40 to 50 years were selected randomly two groups, namely experimental group and control group of fifteen (15) subjects each. Training period of this study was twelve weeks. Experimental group underwent yoga therapy with Varma therapy practices for twelve (12) weeks, six days a week for a maximum of one hour in the morning. The control group was kept in active rest. The pre test and post test were conducted before and after the training for all two groups. To analyses the data (ANCOVA) test was used to find out the significant difference between experimental group and the control group. The test of significance was fixed as 0.05 level of confidence. It was concluded that Yoga therapy with Varma therapy practices significantly decreased on systolic blood pressure and diastolic blood pressure than the Control group among hypertensive middle aged men. © 2020, Biochem. Mapping the Study and Awareness on Early Death Research: A scientometric Analysis
(2020) *Library Philosophy and Practice*, 2020, . Cited 3 times.

[a] Ayya Nadar Janaki Ammal College, Sivakasi, Tamilnadu, India
[b] B.I.H.E.R.–Deemed to be University, Chennai, Tamilnadu, India
[c] Thiruvalluvar University Constituent Arts & Science College, KallakurichiTamilnadu, India

Abstract
To measure the research impact on “Early Death”, literatures indexed in SCOPUS has been downloaded from 1999 to 2018 towards the implemented of a few scientometric techniques. Brief information about the pain of the “Early Death” has been given in the introduction along with the information related to the work done in this research. A few literatures related to the scientometric study have been reviewed. The data utilized for the research work was only for 20 years and from the SCOPUS database, alone. The methodology adopted for the research work was descriptive research. Relevant hypotheses are framed to test the variables. Regression test proved that the literatures published between 2009 and 2013 are fit to calculate the doubling time of the records. Among the type of literatures, “Articles” dominated the other typeof literatures involved in the publications. It was identified that the collaborative publications played dominant role over the single authorship. The degree of collaboration was 0.90. Top three positions towards the maximum productivity have been occupied by the USA authors. The fitness test of Lotka’s Law of Bibliometrics was conducted through Kolmogorov Smirnov Test. The author productivity of this research work does not fit Lotka’s Law of author productivity. The article is concluded with a request to the MHRD of the global countries to encourage the scientists to do many more research on “Early Death” to give more awareness to the society to make the human beings to live and lead a happy long life. © 2020, Library Philosophy and Practice (e-journal). Abstract
The utilization of photodynamic therapy (PDT) has been rapidly increasing due to its advantage as an effective treatment modality for cancer. The organic photosensitizers employed for PDT have some disadvantages, including high toxicity, non-selectivity toward tumors and poor absorption of light. The low light penetration into the tumor sites resulting from low wavelength of absorption and long-term skin photosensitivity. Hence, the attention toward non-toxic inorganic photosensitizers like noble metal nanoparticles (NPs) has been increasing nowadays. In bioscience, NPs are replacing organic dyes since they have photostability and non-toxicity. Generally, nanomaterials can easily form compounds with other substances as well as organic materials and the modified NPs surface enhances the chemical activity. Among the metal NPs, noble metals, especially gold and silver are attractive because of their size and shape-dependent unique optoelectronic properties. The coating of inorganic/organic materials on top of the noble metal makes the NPs bio-compatible and less toxic. Furthermore, Ag- and Au-based inorganic/organic complex NPs could offer a new possibility because of their unique structures. Meanwhile, the coating of inorganic/organic complex NPs protects the noble metals and stabilizes them against chemical corrosion and enhances the production of reactive oxygen species. Thus, in this review, we have highlighted the role of Ag- and Au-based inorganic/organic hybrid nano-photosensitizers in photodynamic therapy. Communicated by Ramaswamy H. Sarma. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

Author Keywords
Ag hybrid nanoparticles; Au hybrid nanoparticles; Photodynamic therapy; photosensitizers

Abstract
Parkinson's disease (PD) is a multi-layered neurodegenerative ailment with cumulative loss of dopaminergic neurons over the limbic areas and nigro-striatal pathways. PD mainly affects the motor behavior of old aged population. Oxidative stress, mitochondrial dysfunction, accumulation of α-synuclein and neuro inflammation was the probable mechanism behind PD pathogenesis. In spite of various understandings, till now effective treatment is unfilled. In PD, both motor signs (tremor, rigidity, akinesia & postural imbalance) and non-motor (NM) symptoms (depression, anhedonia, autonomic dysfunction) were observed. NM deficits mainly affect the quality of life of PD patients. Rotenone and MPTP are the most widely used lipophilic neurotoxins (cross the blood brain barrier) for evaluating the neuro-protective potential of various compounds and drugs against PD. Nutmeg, an aromatic spice possess various pharmacological properties such as anti-diabetic, anti-epileptic, memory enhancer, aphrosidiac, anti-cancer. Rotenone was injected to male Wistar albino rats by intra-peritoneal route (2.5mg/kg daily) for 30days. In our previous study, we indicated that MFSE extract ameliorated motor, memory deficits in rotenone induced PD model. Current study focuses on Myristica fragrans seed (MFSE) extract against rotenone induced non-motor behavioural deficits and biochemical parameters. In PD NM models, forced swim test (FST) and sucrose intake test (SIT) were conducted to access the depressive behaviour, anhedonia. Oxidative stress were studied by biochemical parameters (lipid peroxidase TBARS, catalase, superoxide dismutase and glutathione peroxidase). MFSE extract (oral) treated groups displayed steady increase in climbing behaviour, low immobility time in FST and elevated percentage of sucrose intake in SIT. It might be due to its neuro-protective, anti-depressant properties. © 2020, Advanced Scientific Research. All rights reserved.

Immunohistochemical evaluation of bone morphogenetic protein 3 in chronic periodontitis influenced by Type2 diabetes mellitus

(2020) *Drug Invention Today*, 14 (1), pp. 91-94.

Abstract
Background: Periodontitis and Type 2 diabetes mellitus (T2DM) are chronic lifestyle disorders sharing a two-way relationship. Immunoexpression of bone morphogenetic protein 3 (BMP 3), an antagonist of osteogenesis, gives an insight into possible extent of alveolar bone loss in chronic periodontitis (CP) subjects with or without T2DM. Aim: This study aims to study the immunoexpression of BMP 3 in CP influenced by T2DM. Materials and Methods: This study evaluates the expression of BMP 3 immunohistochemically on gingival sections of CP subjects with or without T2DM. Results: The present study clearly indicates that BMP 3 levels are significantly elevated in gingival epithelium as well as inflammatory cells in subjects with CP t+T2DM when compared with CP subjects and healthy controls. Conclusion: T2DM influences the expression of BMP3 in subjects with CP, which could play a significant role in alveolar bone loss. © 2020 JPR Solutions. All rights reserved.

Abstract

Introduction: Posttransplant lymphoproliferative disorder (PTLD) is a rare complication seen in the period after liver transplant. The commonest subtype is B-cell PTLD which is usually associated with Epstein-Barr virus (EBV) infection. T-cell PTLD is rare and the association with EBV is again rarer. Case: Our patient, a 21-year-old young adult, presented to us with generalized lymphadenopathy, 5 years after liver transplantation. The biopsy of the lymph node was suggestive of peripheral T-cell lymphoma not otherwise specified, which was associated with EBV infection. The Positron emission tomography and computerised tomography (PET-CT) scan showed stage 3 disease. He was treated with standard cyclophosphamide, doxorubicin, etoposide, vincristine, and prednisolone chemotherapy and is currently in remission. Conclusion: Peripheral T-cell lymphoma not otherwise specified is a rare subtype of PTLD and its association with EBV is even more rare. A few patients can achieve complete remission with standard chemotherapy. © 2020 Indian National Association for Study of the Liver

Tensile, flexural and impact behaviors of particulate/calotropis gigantea stem fiber reinforced epoxy composites
(2020) *ARPN Journal of Engineering and Applied Sciences*, 15 (9), pp. 1049-1055.

[a] Department of Mechanical Engineering, Bharath University, Chennai, Tamil Nadu, India
[b] Department of Automobile Engineering, Easwari Engineering College, Chennai, Tamil Nadu, India

Abstract
Increasing demand for the development of alternative materials to plastics and depleting wood stock ushered into the development of new polymer composite materials. These polymer composites are either fiber reinforced or particles impregnated or hybrid of these two materials as well. The natural organic matter present in the reinforcement material contributed significant development in polymer composite's mechanical characteristics. The particulate and fiber reinforced composites was fabricated and tested independently. On comparison, the characteristics of epoxy composites reinforced with four different reinforcements including Chitosen, Red Mud, Rice husk particles and Calotropis Gigantea (CG) stem fiber were carried in the recent investigation. The improved value of characteristics and their respective composites were identified and suggested for industrial applications. © 2020 by the authors.

Abstract
This present study looks at the engine characteristics of beef tallow biodiesel (tallow methyl ethyl ester) produced using methanol–ethanol-based co-solvent transesterification. Unblended samples of tallow methyl ethyl ester (TMEE), tallow methyl ester (TME) and tallow ethyl ester (TEE) were tested for their performance; combustion and emission characteristics in CI engine with ordinary diesel as reference fuel. From combustion characteristics, TMEE reported increased mean peak in-cylinder pressure (5.992 ± 1.34 MPa) and heat release rate (HRR) (61.52 ± 1.28 kJ/m3.deg) than TME on account of its higher cetane number and fuel bound oxygen content; however, TEE exhibited increased mean in-cylinder pressure (1.75%) and HRR (2.14%) than TMEE sample. Likewise, TEE exhibited superior fuel consumption (SFC) rate (on average, 2.67%) and brake thermal efficiency (BTE)(on average, 3.53%) than TMEE; while, TMEE displayed reduced SFC (on average, 11.43%) and increased BTE (on average, 12.46%) than TME in view of its increased calorific value contributed by TEEs in it. Besides, emission characteristics reported reduced CO emission level and exhaust HC concentrations (on average, 10% and 7.1%, respectively); along with slightly increased CO2 and NOX emissions (on average, 4.79% and 5.82%, respectively), in case of TMEE when compared to TME. Here, reduced emission characteristics of TEE, followed by TMEE were because of their high oxygen content and increased cetane number contributed by the ethyl esters available in them; which also signified the completeness of their combustion. © 2020 Taylor & Francis Group, LLC.

Abstract
Background: Plant gums consist of polysaccharides which can be used in the preparation of nanocarriers and provide a wide application in pharmaceutical applications including as drug delivery agents and the matrices for drug release. The objectives of the study were to collect plant gums from Araucaria heterophylla L and Prosopis chilensis L and to extract and characterize their polysaccharides. Then to utilize these plant gum-derived polysaccharides for the formulation of nanocarriers to use for drug loading and to examine their purpose in drug delivery in vitro. Methods: Plant gum was collected, polysaccharide was extracted, purified, characterized using UV-Vis, FTIR, TGA and GCMS and subjected to various bioactive studies. The purified polysaccharide was used for making curcumin-loaded nanocarriers using STMP (sodium trimetaphosphate). Bioactivities were performed on the crude, purified and drug-loaded nanocarriers. These polysaccharide-based nanocarriers were characterized using UV-Vis spectrophotometer, FTIR, SEM, and AFM. Drug release kinetics were performed for the drug-loaded nanocarriers. Results: The presence of glucose, xylose and sucrose was studied from the UV-Vis and GCMS analysis. Purified polysaccharides of both the plants showed antioxidant activity and also antibacterial activity against Bacillus sp. Purified polysaccharides were used for nano-carrier synthesis, where the size and shape of the nanocarriers were studied using SEM analysis and AFM analysis. The size of the drug-loaded nanocarriers was found to be around 200 nm. The curcumin-loaded nanocarriers were releasing curcumin slow and steady. Conclusion: The extracted pure polysaccharide of A. heterophylla and P. chilensis acted as good antioxidants and showed antibacterial activity against Bacillus sp. These polysaccharides were fabricated into curcumin-loaded nanocarriers whose size was below 200 nm. Both the drug-loaded nanocarriers synthesized using A. heterophylla and P. chilensis showed antibacterial activity with a steady drug release profile. Hence, these natural exudates can serve as biodegradable nanocarriers in drug delivery. © 2020 Samrot et al.

Abstract

Image fusion plays a vital role in enhancing the quality of images in medical applications. It is known that CT images of brain shows the details of the bone structure and MRI images of brain shows the details of the soft tis-sue. The Objective of this research is to fuse CT (Computed Tomography) and MRI(Magnetic Resonance Imaging) of normal brain images and tumor affected brain images and to find out structural similarity(SSIM) of the fused image. Axial slice of normal brain and brain tumor images are taken for image fusion. Totally, 24 brain images has been taken out of which 6 pairs are normal brain images and another 6 pairs are tumor affected brain images. Techniques used are Graph-cut method for segmentation, Maximum method for fusion and Swarm Intelligence method for optimization. The proposed fusion method increases SSIM (Structural Similarity) when compared to conven-tional method of fusion. Tumor size in the fused image is also extracted and this fused image is helpful for doctors to analyse the post radio therapy patient or operated patient whether any tumor residues still exist. Also, this method minimises the number of pixels and increases the information contained in a single fused image. This technique aids the physician to analyse complemen-tary details in a single image. © International Journal of Research in Pharmaceutical Sciences.

Interstitial pneumonia with autoimmune features

(2020) *Journal of the Royal College of Physicians of Edinburgh*, 50 (3), pp. 247-255.

DOI: 10.4997/JRCPE.2020.307

Abstract
Interstitial lung disease (ILD) is an umbrella term for lung disease characterised by inflammation and fibrosis of the interstitium. ILD can be idiopathic or secondary to connective tissue disorders, drugs or environmental exposures. Before labelling it as idiopathic we have to rule out secondary causes. ILD is one of the most common extra-articular manifestations of connective tissue diseases (CTDs), causing significant morbidity and mortality. Patients with pre-existing CTD can develop ILD; some patients develop ILD against the background of either one or two clinical features of a CTD or isolated auto-antibody positivity. The current terminology for such an entity is interstitial pneumonia with autoimmune features (IPAF). The current criterion is based on three domains: clinical, serologic and morphologic. To satisfy the IPAF classification criteria, one needs to satisfy the mandatory criterion with one feature from two of the three domains. Classifying patients with this criterion helps in early initiation of immunosuppression and in monitoring them closely for development of features of a well defined CTD. There are a few limitations like the clinical domain being more skewed towards systemic sclerosis and inflammatory myositis, exclusion of antineutrophilic cytoplasmic antibody (ANCA) and cytoplasmic pattern in antinuclear antibody (ANA). There are no clear protocols for treatment of IPAF and most of the data has been extrapolated from the management of systemic sclerosis (SSc) ILD and idiopathic non-specific interstitial pneumonia (NSIP). Progressive disease in spite of treatment demands stronger immunosuppressive agents. Studies on the role of antifibrotics in IPAF are underway, with few small studies showing positive outcomes. There are conflicting reports on the survival and outcome of the IPAF cohort. Certain studies suggest that they have better survival compared with idiopathic pulmonary fibrosis (IPF) though other studies contradict this statement. © 2020, Royal College of Physicians of Edinburgh. Abstract
Colorectal cancer (CRC) is one of the most frequent malignancies, causing human deaths in large numbers around the world. It can be prevented by using chemotherapeutic drugs; however, the available drugs have shown systemic toxicity and drug resistance, which makes the treatment a challenging issue. The use of flavonoid-rich sources may effectively reduce the risk of colorectal cancer. Orientin, a C-glycosyl flavonoid exists in diverse medicinal flora, such as Aspalathus linearis, Ocimum tenuiflorum, Passiflora, and Phyllostachys species, and it has been shown to have beneficiary effects in treating cancers, cardiovascular diseases, and neurodegenerative disorders. Recent preclinical validation studies on orientin have evidently shown its anti-carcinogenic effect against human colorectal adenocarcinoma cells and carcinogen-induced CRC albino Wistar rat models. Orientin reinstates the antioxidants to put forth their scavenging mechanism and limits the activation of phase 1 enzymes. Orientin induces mitochondrial intrinsic apoptosis in CRC cells, and thereby actively interrupt cell proliferation and inflammatory signaling pathways without disturbing the normal tissue. Research reports have reported the attenuating effects of orientin on aberrant crypt foci progression in cancer-bearing animal, and it results in a significant suppression of pre-neoplasia to malignant neoplasia transformation. Orientin also suppresses NF-κB and the associated inflammatory cytokines, and thereby ameliorates inducible nitric oxide synthase and cyclooxygenase-2 expression in 1, 2-dimethylhydrazine rat models. Thus, this chapter emphasizes the therapeutic effects of flavonoids with a special focus on orientin against CRC. Also, it summarizes our understandings about the molecular mechanisms behind orientin-mediated cancer prevention. © Springer Nature Singapore Pte Ltd. 2020.

Abstract
Urinary bladder cancer would be a serious health issue among human individuals. Current treatments are not effective so there is to be an optional therapy should be introduced to halt the reoccurrence of cancer. Phytochemicals does not own any adverse effect in patients with cancer. Our research is to investigate that the Diindolylmethane (DIM) and Lupeol treatment eliminates urinary bladder cancer development by activating the apoptosis by its anti-inflammatory properties. The male albino wistar rats were equally separated into 6 groups. Each group possesses 10 rats. G-I: Control. G-II: N-butyl-N-(4-hydroxybutyl) nitrosamine (BBN) was administered orally for 8 weeks. After 8 weeks of BBN toxicity, Dimethylarsinic acid (DMA) was provided for 28 weeks in drinking water. G-III and G-IV: After BBN initiation, DMA was provided for 28 weeks in drinking water. Diindolylmethane and Lupeol were also administered orally for 28 weeks along with DMA. G-V and G-VI: Diindolylmethane alone and Lupeol alone were administered orally for 36 weeks. The experimental rats were euthanized at 36th week. The urinary bladder was macroscopically and microscopically analyzed in control and treated groups. Diindolylmethane and Lupeol therapy inhibited the tumor formation in the urinary bladder. Our study proved that both Diindolylmethane and Lupeol are being capable of targeting these signaling pathways which would make them potentially applicable to cancer chemoprevention and treatment. © 2020 Old City Publishing, Inc.

Author Keywords
Apoptosis; Diindolylmethane (DIM); N-butyl-N-(4-hydroxybutyl) nitrosamine (BBN); Urinary Bladder Cancer

Index Keywords
antineoplastic agent, cacodylic acid, diindolylmethane, drinking water, lupeol, n butyl n (4 hydroxybutyl)nitrosamine, unclassified drug; animal cell, animal tissue, antiinflammatory activity, apoptosis, Article, bladder, bladder cancer, bladder tissue, cancer prevention, carcinogenesis, chemoprophylaxis, controlled study, drug targeting, male, nonhuman, priority journal, rat, signal transduction, treatment duration, tumor growth

Chemicals/CAS
cacodylic acid, 124-65-2, 75-60-5; lupeol, 545-47-1; n butyl n (4 hydroxybutyl)nitrosamine, 3817-11-6

Manufacturers
TCI, Japan; Sigma Aldrich, United States

Abstract
Costus speciosus is being widely used in Indian folk medicine for treating various disorders. Environmental noise pollution is supposed to be an important factor for many health problems and it causes immune abnormalities. In the present study immune-regulating potential of Costus speciosus extract was evaluated during acute and subacute noise stress conditions. Adult Wistar albino rats were exposed to acute noise stress and subacute noise stress and then the effect of ethanolic Costus speciosus rhizome extract on immunological parameters such as phagocytic index, avidity index, neutrophil adherence test and total leucocyte count were studied. Neutrophil adherence and total leukocyte counts were found decreased and the percentage of avidity and phagocytic index were significantly increased in the stressed group of rats. The result of statistical analysis showed that, the pre-treatment with Costus speciosus extract significantly altered favourably the levels of immunological parameters. Ethanolic extract of Costus speciosus rhizome have the potential to prevent noise stress induced changes in rodent immune system and has a strong immunomodulatory prospective applicable to clinical practices. © International Journal of Research in Pharmaceutical Sciences.

Argyreia nervosa reduces alcohol-induced altered levels of oxidative stress in the liver Wistar male albino rats
(2020) *Drug Invention Today*, 13 (1), pp. 134-139.

Abstract
Background: Oxidative stress has been considered as a conjoint pathological mechanism, and it contributes to the initiation and progression of liver injury. A lot of risk factors, including alcohol, drugs, environmental pollutants, and irradiation, may induce oxidative stress in liver, which in turn results in severe liver diseases. Argyreia nervosa, a medicinal herb, has been shown to have a high value of antioxidant property; it is traditionally used in the treatment of gonorrhea, strangury, chronic ulcer, skin disease, bowel complaints, appetizer, pain killer, brain tonic, and aphrodisiac. Aim: The present study was designed to evaluate the effects of A. nervosa on oxidative stress makers and antioxidant enzymes in the liver of alcohol-induced liver of male rats. Materials and Methods: A. nervosa leaf extract oral doses (100 and 300 mg/kg body weight) were given once in a day for 8 weeks to ethanol-induced rats. At the end of the experimental period, liver tissues were dissected out and assessed for various parameters. Results: In alcohol-induced rats, the reactive oxygen species such as H2O2. Lipid peroxidation and hydroxyl radical levels were also found to be raised compared to control. Conversely, antioxidant enzymes such as superoxide dismutase, catalase, and glutathione peroxidase were found to be reduced. Oral administration of A. nervosa leaf ethanolic extract could effectively normalize the abnormal levels of these oxidative stress parameters and antioxidant enzymes altered by alcohol-induced liver toxicity. Conclusion: This preliminary study concludes that A. nervosa leaf extract has a potential hepatoprotective effect which can be used as a potential herbal medicine for the treatment of liver diseases. © 2020 JPR Solutions. Abstract
Background: Argyreia nervosa commonly known as elephant creeper, woolly morning glory. (English) Vriddhadaru, and Samundrasok (Sanskrit) belongs to family Convolvulaceae, traditional plant claimed as more therapeutic value. Objective: The present study was carried out to highlight phytochemical screening of A. nervosa, and it was analyzed using various solvent such as ethanol, methanol, chloroform, N-hexane, aqueous, and hydroalcohol. Materials and Methods: Leaf and root of A. nervosa extracted with different solvents. Results: The phytochemical screening of various extracts of leaf and root of A. nervosa revealed the presence of alkaloids, carbohydrates, proteins, steroids, phenols, tannins, flavonoids, and saponins. The hydroalcoholic extract showed high extractive value when compared to aqueous and other solvents. Conclusion: The present study concludes that A. nervosa extract can be used as one of therapeutic potential drugs for the treatment of various diseases due to its antioxidant properties. © 2020 JPR Solutions. Abstract
Objective: The present deals with the gas chromatography-mass spectrometry (GC-MS) analysis of one Ayurvedic digestive formulation, Ashtachurnam. Materials and Methods: Ashtachurnam was procured from standard Ayurvedic vendor from Chennai and was subjected to GC-MS analysis following standard procedure. Results: Some important biomolecules such as cycloheximide, piperine, 1-heptatriacotanol.,beta.-sitosterol, Thymol, and n-decanoic acid with medicinal values were found in the GC-MS profile. Conclusion: The types of molecules present in the GC-MS indicate their overall medicinal role correlating to Ashtachurnam. © 2020 JPR Solutions. All rights reserved.

Abstract
The brain is widely used in many medical fields. Tumour pandemic drastically influences the health and well-being of the global population. In this proposed methodology, the deep learning approach is performed. The extracted image of the brain cannot be directly used for diagnosis. The captured image contains disturbances like noise, blurred image etc. To get a high-quality image from extracted panoramic. This approach is performed. To the extracted images, partitioning is performed to split up the images into samples. It helps for better recognition and classification. It shows the infected region of the brain accurately. Before performing partitioning, the extracted image has to be preprocessed to clear out the disturbances in the image. After partitioning, feature extraction is performed by using GLCM and finally, classification is performed between the trained and test set data to produce a highly accurate image. It is done by using CNN classifier. This processed image helps the dentist for good prediction. © 2020 EManuscript Technologies. All rights reserved.

Investigation of hybrid locomotive robot for anti-personnel mine detection
(2020) *International Journal of Vehicle Structures and Systems*, 12 (1), pp. 70-73.

DOI: 10.4273/ijvss.12.1.15

Abstract
Most of landmine detection robots proposed so far have been strongly restricted from locomotion inside the mine field because they cannot cross over the mine. So we have proposed a mine detection robot with hybrid locomotion, which can enter inside the minefield with low ground surface contact, which can cross over the mine instead of changing its path and scan landmines directly using Electro Magnetic Induction sensor. The hybrid locomotion proposed in the robot uses the frame walking technique and the conventional wheeled locomotion. The robot switches over the locomotion mechanism from wheeled to leg when mine is detected and vice versa with a lead screw mechanism. The leg locomotion is achieved by frame walking technique where the two frames translate with the help of lead screw mechanism. A purpose of adopting this combination is to evade anti-personnel landmines which are relatively smaller in comparison to their anti-tank landmine counterparts. The robot initially starts in wheeled mode and upon detection of metal, pulls in the frame walking algorithm. The robot also deploys an obstacle avoidance algorithm when working in wheel mode. © 2020. MechAero Foundation for Technical Research & Education Excellence.

Abstract
The untrustable nature of the cloud server and the information protection of clients is important to scramble the information before redistributing the cloud. Main aim is to acknowledge the protected keyword search over encrypted data against noxious clients and malcioust cloud specialist organizations, we discover a traded off technique into the square chain into SSE the distributed storage utilized in accessible symmetric encryption plans (SSE) is given in a private way, which can't be viewed as a genuine cloud. Also, the cloud server verifies the data working on that open chain. We present a framework that influences blockchain innovation to furnish protected dispersed information stockpiling with keyword search administration. The System enables the customer to transfer there in scrambled structure disseminates the information substance to cloud hubs and guarantee information accessibility utilizing cryptographic methods we present a framework that influences blockchain innovation to furnish a safe appropriated information stockpiling with catchphrase search administration. Trustworthy keyword search verified the server-side verifiability which hide the authorized cloud servers from being encircled by vindictive information proprietors in the information storage stage. Moreover, the blockchain findings and hash applications are applied to the values to cost of keyword searching without presenting any intruder checking the client-side harmful. Our proposed security keyword checking and execution will prove this keyword search trustable and more secure and efficient for cloud computing applications. © 2020 IEEE.

Abstract
This study extensively investigated to find out the in-vivo acute toxicity and lethal concentration (LC50) of biosynthesized Ag NPs in Labeo rohita (L. rohita). The haematological studies and antioxidative responses were considered in three tissues such as gill, liver and muscle of L. rohita. The results of this study showed that increasing the dose of Ag NPs led to bioaccumulation in the tissues. The haematological analysis showed considerable alterations in the Ag NPs-treated fish. The impact of histological changes induced by Ag NPs were confirmed by the damages in the tissues, primary lamella, blood vessels and formation of vacuolation in liver and muscle when compared with the control L. rohita. © 2020 Open Access House of Science and Technology. Abstract
This present study focus on the process optimization and characteristic assessment of waste animal fat (WAF) biodiesel based on the influence of fatty acids characterized in it. WAFs were rendered from leather fleshing (subcutaneous fat, 85.64%) and slaughterhouse (intramuscular fat, 8.46%) wastes using dry rendering technique, wherein the maximum renderable fat content was found to be 75.77% and 5.89%, respectively. Ethyl esters of oleic acid, palmitic acid, and stearic acid were characterized as dominant fatty acid esters (FAEs) in WAF biodiesel. Optimized transesterification on waste fats using ethanol and synthesized D-valine amido ethyl methyl imidazolium chloride ([D-Vaemim]Cl) as novel ionic liquid (IL) catalyst yielded 97.36% of biodiesel. High molar ratio (WAF to ethanol:6) and reaction temperature (75°C) were accounted by the long-chain fatty acids in triglyceride molecules and their higher degree of saturation, respectively, meanwhile, [D-Vaemim]Cl exhibited high conversion yield beyond 10% and was effective up to 10 cycles. Similarly, biodiesel properties were evaluated as per ASTM D6751 standards, were found to be in acceptable range, and were deeply influenced by carbon chain length and degree of unsaturation in FAE molecules. Also, the presence of long-chain saturated FAEs along with fuel bound oxygen induced superior combustion characteristics and controlled emission concentrations. However, slight reduction in engine performance was due to high viscosity and reduced calorific value of biodiesel which was reflected from its FAE molecules. © 2020, © 2020 Taylor & Francis Group, LLC.

Abstract
This present study deals with the theoretical prediction of thermo-physical properties of waste beef tallow biodiesel by means of developing mathematical correlations using fatty acid esters. Waste beef tallow was rendered from animal slaughter houses and tanneries' leather fleshing wastes; and was transesterified into biodiesel through base catalyzed ethanolysis. Ethyl palmitate (C16:0), ethyl oleate (C18:1) and ethyl stearate (C18:0) were identified as the dominant fatty acid ethyl esters (FAEs) in the tallow biodiesel, with their corresponding distribution as 37.36%, 25.17% and 14.78% respectively. Mathematical correlations were developed for predicting density, kinematic viscosity, cetane number and higher heating value using statistical regression by maintaining molecular weight (Mwt) and number of unsaturated bonds (NE) of FAEs as input variables. Overall, thermo-physical properties of the biodiesel were computed from the properties calculated using the correlations, mass fraction and mole fraction of characterized FAEs; and was compared with the experimental data determined according to ASTM D976 standards. Accordingly, the average absolute deviation (AAD) and average Absolute Percentage Error (AAPE) were calculated as 3.55, 0.815% for density; 0.12, 4.79% for kinematic viscosity; 2.14, 6.56% for cetane number and 0.23, 1.14% for higher heating value respectively. From these correlations, it showed that kinematic viscosity, cetane number and higher heating value increased with molecular weight of the FAEs but reduced with increase in unsaturation; in contrast, density of biodiesel increased with its unsaturation but decreased with increasing molecular weight. In conclusion, the predicted values of density, kinematic viscosity, cetane number and higher heating value were found to be in reasonable agreement with experimental values. © Faculty of Mechanical Engineering, Belgrade.

Abstract
This paper has presented about single-input dual output DC-DC Converter. Low or medium voltage applications are connected as input side and the large voltage compounds are connected in output of this converter. Solar energy devices as connected to the input side output side less voltage and more voltage applications are connected. In this circuit, voltage stress and inductors sizes are minimized as follow has efficiency and power factor value are increased. In case of RL Load and motor load current and voltage are measured. The simulation and experimental results are presented and verified. © 2020, Institute of Advanced Scientific Research, Inc.. All rights reserved.

Abstract

Background: Chitosan, chitosan nanoparticle, ethanolic extracts of Anacyclus pyre-thrum root and Cyperus rotundus rhizome were evaluated against plasmid mediated multidrug resistance of Enterococcus faecalis, Staphylococcus aureus and Bacillus sp. isolated from unstimu-lated saliva of chronic periodontitis. The main aim of the current study centres the reduction of antibiotic consumption and the development of natural compounds to combat multidrug resistance. Methods: Identification of bacteria, antimicrobial susceptibility, plasmid stability and plasmid curing was carried out for the characterization of resistance plasmids. Results: E. faecalis showed 89% of sensitivity to chitosan nanoparticle, chitosan 81%, C. Rotun-dus 69% and A. pyrethrum 62% for S. aureus, with the MIC >100 µg/ml. In comparison with the antimicrobials tested, maximum resistance to tetracycline (89%) for E. faecalis, is followed by ampicillin (87%) and tetracycline (81%) for S. aureus. Meanwhile, chloramphenicol and tetracycline (80%) for Bacillus sp. The plasmid stability for E. faecalis (20%), S. aureus (<4%) and Bacillus sp. (16%). The order of stability corresponding to the broth media is LB > BHI > nutrient for E. faecalis, S. aureus but similar in LB and nutrient broth for bacillus sp. The maximum plasmid curing efficiency of chitosan for S. aureus (76%), Chitosan nanoparticle for E. faecalis (88%), A. pyrethrum for S. aureus (73%), C. rotundus for E. faecalis (87%). The order of plasmid curing efficiency is chitosan nanoparticle>C. rotundus>chitosan>A. pyrethrum. Conclusion: Chitosan, Chitosan nanoparticle, C. rotundus, and A. pyrethrum offered a greater potential in eliminating plasmid mediated resistance acquired by periodontal pathogens, thus address-ing this crisis in dentistry. 2020 Bentham Science Publishers.

Abstract

Aim & Objectives: To assess the awareness of patient's dental record maintenance among BDS students and to evaluate their knowledge regarding the potential use of their maintained records in forensic identification. Materials and Method: Data was collected by means of a self administered questionnaire consisting of 24 closed ended questions, addressed on the awareness about patient's dental record maintenance and its importance in forensic needs among 3rd, 4th year BDS students and interns of a private dental college. Results: 73.1% of the respondents were aware that dentists were legally bound to maintain records in India and 83.5% were aware that these could contribute towards forensic investigations. Most of the students were aware of how to maintain dental records in an institution. 67.4% of the study population felt the need to store records for a minimum of 5 years. 65-70% had knowledge regarding denture markers and role of implants in forensic identification. The most perceived barrier to good dental record keeping was lack of time according to most of the students. Conclusion: The survey revealed awareness on the importance of dental records in forensic identification among BDS students. Few areas showed inadequate knowledge, thus mandating an utmost need to train dental students in this field. Newer methods like denture marking and Aadhar number in corpoartion in prostheses should be given importance. © 2020, Indian Journal of Forensic Medicine and Toxicology. All rights reserved.

Abstract
The paper represents the numerical investigation of heat transfer characteristics in a pipe provided with twisted tape inserts is analyzed. The heat transfer was analyzed in a swirling flow conditions using CFD simulation. A commercial CFD package was used for analyze twisted tape for circular tube fitted with triangular cut twisted tape and circular hole cut twisted tape inserts. The twisted tape system allows a significant increase of convective heat transfer coefficient by introducing the swirl flow motion. The swirl flow motion provides greater heat transfer rate extracted from the solid surface of the tube. The depth of cuts for triangular cut 5 mm and depth of hole cut 5 mm twisted tapes were used for simulation generation. In this paper CFD analysis was used for enhancement of heat transfer rate of fluid of laminar flow. The experimental investigation were conducted in double pipe heat exchanger and these value of plain twisted tape, triangular twisted tape and circular hole cit twisted tape were taken for used simulation analysis. The performance of heat transfer rate was enhanced 1.1-1.3 times compared that the plain twisted tape and circular cut twisted tape. The data obtained from the simulation correlations for triangular cut twisted tape and circular hole cut twisted tape; and these data were correlated with plain twisted tape. © 2019 Elsevier Ltd. Abstract
Natural fibers are one of the abundant resources that exist in nature. They are easily decomposable, bio degradable, renewable and cost efficient. It can be extorted from various plant & animal resources. They are used as reinforcement material in polymers for the growth of natural-fiber composites. The mechanical properties of epoxy resin, reinforced with various natural fiber materials/agricultural by product particles are compared in the present study. This review intends to provide basic and background information of the natural fibers and their composites to trigger new research activities and facilitate development of new variety polymer composites. © 2019 Elsevier Ltd. Abstract
A Vehicle trailing system is employed for the trailing purpose most vibrantly this tracks the vehicle location however the damaging robberies, accidents etc… can't be indicated to the most server at correct the correct} time and conjointly proper security can't be attainable by victimization trailing system in vehicles particularly for money vans, In banking sector money van plays a crucial role therefore time period observance of money van's location is crucial for supplying suppliers not solely to confirm safe and timely delivery, however conjointly to spot the situation wherever it travels Our mounted GPS unit sends the vehicle's location info to the room. {the data|the info|the info} is then collated and processed on digital maps to get crucial information like location, observance of alarm systems, and emergency help. Then the Vehicles square measure equipped with police work cameras to capture any unforeseen activities. this can be essential to observe the money together with the activities of the keeper, motion within the money van. Vans square measure monitored 'LIVE' throughout the journey. during this paper, I actually have mentioned however the money supplying method is finished underneath police work and the way the GPS tracks the situation of the money van for security functions. © 2019 by Advance Scientific Research. Abstract
Online social media is pervasive in nature. It allows people to use short text messages, images, audios and videos to express their opinions and sentiments about products, events and other people. For example, Twitter is an online social networking and news service where users post and interact with small and short messages, called "tweets". Therefore, nowadays social media become a potential source for business and celebrities to find people's sentiments and opinions about a particular event or product or themselves. Social media analysis is the process of gathering enormous amount of digital contents generated online from blogs sites and social media networks and examining them to find the insights. This paper focuses on discovering public opinions and sentiments he on the results of Indian election results declared recently. This Paper also deals Dictionary based Approach and Affective Lexicon based approaches which were used to find the public opinion about election results. © 2020, Springer Nature Switzerland AG.

Abstract
Rough set theory is a simple and potential methodology in extracting and minimizing rules from decision tables. Its concepts are core, reduct and discovering knowledge in the form of rules. The decision rules explain the decision state to predict and support the new situation. Initially it was proposed as a useful tool for analysis of decision states. This approach produces a set of decision rules involves two types namely certain and possible rules based on approximation. The prediction may highly be affected if the data size varies in larger numbers. Application of Rough set theory towards this direction has not been considered yet. Hence the main objective of this paper is to study the influence of data size and the number of rules generated by rough set methods. The performance of these methods is presented through the metric like accuracy and quality of classification. The results obtained show the range of performance and first of its kind in current research trend. © 2018 King Saud University

Abstract

Series of Sr hexaferrites (HFs) co-substituted with Nb3+ and Y3+ ions (SrYxNbxFe12-2xO19 (x ≤ 0.05) were prepared via sol-gel combustion method. In addition to their optical, low temperature, magnetic properties and hyperfine interactions were investigated in detail. X-ray diffraction (XRD) patterns were considered proving both the formation and pureness of products. Mossbauer analysis indicated that the hyperfine field on iron nuclei at all sites decrease with substitution of Y3+-Nb3+ ions into Sr-hexaferrite as a result of changing the magnetic Fe3+ (5 μ B) ions by nonmagnetic Y3+ and Nb3+ ions. This leads to decreasing of the magnetic super exchange interaction between the ions. Measurements of AC susceptibility and ZFC-FC magnetizations implemented in a range from room temperature (RT) down to around 2 K. The analysis of MFC-MZFC data proves the ferrimagnetic performance of different prepared HFs in the whole range of 2-325 K and a super-spin glass-like behavior was identified at minimal temperatures. The investigation of AC susceptibility revealed a weakening in the magnetic exchange interactions with the rise in the Nb3+ and Y3+ ions ratios. © 2020 IOP Publishing Ltd.

Abstract
A Wal-Mart salesman was trying to surge the sales data of the store by combining the commodities together and putting discounts on those products. The goods are clearly distinct thus he found that nurturing kids is exhausting. Data Mining, also known as KDD [1], to find irregularities, associations, arrangements, and tendencies to forecast consequences. Apriori algorithm is a standard process in data mining. It is utilized for mining recurrent sets of items and related association rubrics. It is formulated to work on a database comprising of a lot of transactions. It is very vital for operative Market Basket Investigation and this assistance the patrons in buying their substances with more effortlessness which escalates the sales of the markets. While finding goods to be associated together, it is imperative to have some association on which the commodities can be listed together. In this research work a hybrid method has been proposed to minimize association rules using optimization algorithm Differential Evolution with Apriori Algorithm. Firstly, Apriori algorithm is applied to generate frequent itemsets and association rules. Then, AMO is used to reduce the number of association rules with a new fitness function that incorporates frequent rules. It is observed from the experiments that, in comparison with the other relevant techniques, ARMAMO greatly reduce the computational time for frequent item set generation, memory for association rule generation, and the number of rules generated. Data mining is a process that uses a variety of data analysis tools to discover patterns and relationships in data that may be used to make valid predictions. Association rule is one of the popular techniques used for mining data for pattern discovery is the KDD. Rule mining is an important component of data mining. To find regularities/patterns in data, the most effective class is association rule mining. Mining has been used in many application domains. In this paper, an efficient mining based algorithm for rule generation is presented. © 2020 SERSC.

Abstract
There is a growing awareness in today's workplaces that employees do not give up their lives just because they work. Work and life remain the two most important domains in the life of an employed individual. However, the challenge of balancing work and non-work demands is one of today's central concerns for both individuals and organisations. With the growing diversity of family structures represented in today?s workforce, particularly with the growing norm of dual-career families, the importance of managing an employee's work-life balance have increased markedly over the past 20 years. Employers are realising that the quality of an employee's personal and family life impacts work quality and that there are concrete business reasons to promote work and non-work integration. In this paper, we contend that assisting employees to achieve a work-life balance should become a critical part of HR policy and strategy if it is to truly get the best from the organisation's people without leaving them unsatisfied, burnt-out and unfulfilled. © IAEME Publication.

Abstract
Employee Work Life Balance (WLB) is a major driver in the organization that helps to achieve higher productivity. It is a healthy blend of both employee's work life and personal life. There are many factors influencing work-life balance of an employee in the organization. The researchers have identified some factors along with demographic variables to study and understand the work life balance. To recognize the connection between high-quality of labor lifestyles and employees satisfaction. To apprehend the measures taken by means of the employer to beautify the standard of exertions lifetime of the workers in the business enterprise. To beautify the excellent of living of the workers. To make a nice attitude inside the minds of the workers. To increase the effectiveness of the organizations. The current study focuses the factors influencing the work life balance of employees and the results of the study will help the organization to enhance better work life balance towards higher level of productivity. © IAEME Publication.

Abstract
Employee Work Life Balance (WLB) is a major driver in the organization that helps to achieve higher productivity. It is a healthy blend of both employee's work life and personal life. There are many factors influencing work-life balance of an employee in the organization. The researchers have identified some factors along with demographic variables to study and understand the work life balance. To recognize the connection between high-quality of labor lifestyles and employees satisfaction. To apprehend the measures taken by means of the employer to beautify the standard of exertions lifetime of the workers in the business enterprise. To beautify the excellent of living of the workers. To make a nice attitude inside the minds of the workers. To increase the effectiveness of the organizations. The current study focuses the factors influencing the work life balance of employees and the results of the study will help the organization to enhance better work life balance towards higher level of productivity. © IAEME Publication.

Abstract
Introduction: In the management of neurodegenerative and neuropsychiatric diseases, memory loss remains very challenging. Saraswatharishtam (SWRT) is an ayurvedic formulation prescribed for several neurological illnesses like acute anxiety, partial memory loss, slurred speech, neuro degenerative diseases like Parkinson's, Alzheimer's etc. Methods: Present study explores the possibilities of curative effects of SWRT on Scopolamine induced memory impairment and to compare the effects of commonly used drug piracetam. Adult Wistar Swiss albino mice were used for this experiment and divided into five different groups for the treatments of the drugs in various combinations. The first group was vehicle treated control while the second group was treated with scopolamine to induce memory impairment. The third group of animals were treated with Scopolamine where the mice were pretreated with standard neuroprotective drug Piracetam, while the fourth and fifth group of animals were treated with scopolamine and the animals were pretreated with SWRT at the doses of 200 and 400 mg/kg respectively to compare with the effect of Piracetam. Scopolamine was administered on day eight, only for 45 minutes in all the cases (Group I- Group V). Several neurobehavioral parameters were examined to confirm the neuroprotective effects of SWRT. Results: Saraswatharishtam significantly reversed the memory loss in mice model revealed from elevated plus maze, radial maze and rectangular maze experiments justifying its neuroprotective potential as observed in usually used synthetic Piracetam. SWRT was found to be nontoxic and very promising antioxidant recorded from acute and chronic toxicological studies. Conclusions: It is suggested that SWRT, could be used as safe and easily available Ayurveda medicine to treat neurological dysfunctions without any side effects. Further translational research is needed to explore its neuro-protective potential. © 2020 Phcogj.Com.

Abstract
Introduction: In the management of neurodegenerative and neuropsychiatric diseases, memory loss remains very challenging. Saraswatharishtam (SWRT) is an ayurvedic formulation prescribed for several neurological illnesses like acute anxiety, partial memory loss, slurred speech, neuro degenerative diseases like Parkinson's, Alzheimer's etc. Methods: Present study explores the possibilities of curative effects of SWRT on Scopolamine induced memory impairment and to compare the effects of commonly used drug piracetam. Adult Wistar Swiss albino mice were used for this experiment and divided into five different groups for the treatments of the drugs in various combinations. The first group was vehicle treated control while the second group was treated with scopolamine to induce memory impairment. The third group of animals were treated with Scopolamine where the mice were pretreated with standard neuroprotective drug Piracetam, while the fourth and fifth group of animals were treated with scopolamine and the animals were pretreated with SWRT at the doses of 200 and 400 mg/kg respectively to compare with the effect of Piracetam. Scopolamine was administered on day eight, only for 45 minutes in all the cases (Group I- Group V). Several neurobehavioral parameters were examined to confirm the neuroprotective effects of SWRT. Results: Saraswatharishtam significantly reversed the memory loss in mice model revealed from elevated plus maze, radial maze and rectangular maze experiments justifying its neuroprotective potential as observed in usually used synthetic Piracetam. SWRT was found to be nontoxic and very promising antioxidant recorded from acute and chronic toxicological studies. Conclusions: It is suggested that SWRT, could be used as safe and easily available Ayurveda medicine to treat neurological dysfunctions without any side effects. Further translational research is needed to explore its neuro-protective potential. © 2020 Phcogj.Com.

Abstract
AutomatedTeller Machine (ATM) is one broadly preferred choice for money withdrawal for consumers. Getting an ATM with required amount and section has constantly demonstrated to be an obstacle for consumers looking for money. One approach to counter this is to introduce progressively number of ATMs in region to guarantee the client's necessities are met. Anyway this demonstrates to be an overhead for bank utility as far as support and activity cost.Here in this paper we are involving IoT which can get noteworthy cost reserve funds in the board and tasks of ATMs. It is regularly observed ... By interfacing the sensors to a focal cloud-based revealing and the executives dashboard, banks can take preventive activities in time, inevitably sparing a great deal on vitality and upkeep costs. Modern money arranging, keen checking of ATM occurrences, and defense of the ATM impression, banks can cut their absolute expense of overseeing money by as much as 10 to 15 percent. The subsequent wave is re-appropriating. The objective is to accomplish critical cost decrease and improve money the executives tasks, with the scope covering branch, the values are compared with the database and the lock is allowed to open using a random One Time Password (OTP). © 2019 by Advance Scientific Research.

Abstract
Burns injury is a global issue; when burns left unmonitored, it may lead to sepsis & hypovolemia. It majorly contributing to the country's morbidity and mortality. Accidental burns are quite common throughout the world. The degree of burns differs variably, and to identify a possible therapeutic option, it is of great importance for the researchers and scientists. Achieving a uniform burn wound model is thus required to study the burns injury at different levels involving epidermis, dermis, and hypodermis. The goal of this study is to create a simple third-degree contact burn in Wistar albino rats. Third-degree contact burn wound was monitored on 7th, 14th, and 21st day for natural wound healing under gross and histopathological observation. Gross observation reported damaged skin to appear dry, leathery, and charred. Wound closure was observed to be delayed and incomplete on day 21. Histopathol-ogy revealed a wound healing process by hematoxylin and eosin method. This metal surface contact method revealed a simplified and cost-effective method for inducing a third degree of a wound in Wistar rats. The study is thus a milestone that could enable research progress in the area of wound healing. © 2020 J. K. Welfare and Pharmascope Foundation. All rights reserved.

Abstract
A series of febuxostat based new chemical entities was synthesized using microwave method and characterized by NMR, mass and FT-IR spectral studies. Molecular docking of febuxostat amide nucleus substitution compounds 8c (-7.91kcal/mol), 8g (-7.94 kcal/mol) exhibiting high binding energy against ALK receptors. Theoretical investigation of MEPs, HOMO, LUMO and energy gap of HOMO-LUMO were calculated by B3LYP/6-31G method. Among the tested compounds, methoxy substituted compound 8g showed highest antibacterial activity against S. aereus and B. subtilis. © 2020 Chemical Publishing Co.. All rights reserved.

Abstract
Skin is an ectodermal derivative that maintains internal homeostasis of the body. Any damage to the skin like burn injury internal homeostasis is lost, resulting in delayed healing. The aim is to study the histoarchitecture comparative effect of silver nitrate gel, and BMSCs (DDP) on third-degree burns in Wistar rats. A burn wound of size 2.5 cm (length) x 2.5 cm (breadth) x 6 mm (depth) was created using a preheated metal plate on flanks of Wistar rat. Every burn wound was treated with silver nitrate gel (commercially available as silverex), bone marrow differentiated dermal precursors, and monitored for 1, 7, 14, 21 days until wound healing. Wound surface area was measured and compared among groups with histological and gross observations. The healing time was faster in bone marrow differentiated dermal precursors (DDP) group compared to control. Prolonged silver nitrate gel usage heals burn wound with no infection, but silver toxicity was noted. Wound contraction is slower but steady using bone marrow differentiated dermal precursors (DDP) cell when compared to the group treated with silver nitrate gel. The data from this study help use to use bone marrow differentiated dermal precursors (DDP) cells as an alternate and effective way to treat burn wounds. © 2020, International Journal of Research in Pharmaceutical Sciences. Abstract
In the Internet of Things (IoT) vision, standard devices become adroit and self-administering. This vision is changing into a reality in view of advances in development, yet there are still challenges to address, especially in the security area e.g., information unwavering quality. Considering the anticipated development of the IoT in the coming years, it is important to give trust in this tremendous approaching data source. Blockchain has developed as a key innovation that will change the manner by which we share data. Building trust in passed on circumstances without the prerequisite for experts is a mechanical development that can change various endeavors, the IoT among them. Problematic headways, for exam ple, enormous information and distributed computing have been utilized by IoT to beat its confinements since its origination, and we think Blockchain will be one of the following ones. This paper centers around this relationship, explores difficulties in Blockchain IoT applications, and outlines the most huge work in order to analyze how Blockchain could be utilized in real money coordination. © 2020 IJSTR.

Abstract
DEEP eutectic solvents (Ionic liquids)(DESs), a new type of low cost and eco-friendly solvent, have fascinating rising interest in chemistry. To recapitulate the properties and significance of deep eutectic solvents (DESs), this review focus on characteristics of deep eutectic solvents, as well as their applications in electrochemistry, catalytic activity, biodegradability, bio-catalysis, as aromatic hydrocarbons, extraction and separation. The existing data and references are appraisal to go over the developments of DESs. © 2020 National Information and Documentation Center (NIDOC).

Abstract
Background: Tuberculosis causes more deaths than any other infectious disease worldwide, with pulmonary tuberculosis being the most common form. Standard first-line treatment for drug-sensitive pulmonary tuberculosis for six months comprises isoniazid, rifampicin, pyrazinamide, and ethambutol (HRZE) for two months, followed by HRE (in areas of high TB drug resistance) or HR, given over a four-month continuation phase. Many people do not complete this full course. Shortened treatment regimens that are equally effective and safe could improve treatment success. Objectives: To evaluate the efficacy and safety of shortened treatment regimens versus the standard six-month treatment regimen for individuals with drug-sensitive pulmonary tuberculosis. Search methods: We searched the following databases up to 10 July 2019: the Cochrane Infectious Diseases Group Specialized Register; the Central Register of Controlled Trials (CENTRAL), in the Cochrane Library; MEDLINE (PubMed); Embase; the Latin American Caribbean Health Sciences Literature (LILACS); Science Citation Index-Expanded; Indian Medlars Center; and the South Asian Database of Controlled Clinical Trials. We also searched the World Health Organization (WHO) International Clinical Trials Registry Platform, ClinicalTrials.gov, the Clinical Trials Unit of the International Union Against Tuberculosis and Lung Disease, the UK Medical Research Council Clinical Trials Unit, and the Clinical Trials Registry India for ongoing trials. We checked the reference lists of identified articles to find additional relevant studies. Selection criteria: We searched for randomized controlled trials (RCTs) or quasi-RCTs that compared shorter-duration regimens (less than six months) versus the standard six-month regimen for people of all ages, irrespective of HIV status, who were newly diagnosed with pulmonary tuberculosis by positive sputum culture or GeneXpert, and with presumed or proven drug-sensitive tuberculosis. The primary outcome of interest was relapse within two years of completion of anti-tuberculosis treatment (ATT). Data collection and analysis: Two review authors independently selected trials, extracted data, and assessed risk of bias for the included trials. For dichotomous outcomes, we used risk ratios (RRs) with 95% confidence intervals (CIs). When appropriate, we pooled data from the included trials in meta-analyses. We assessed the certainty of evidence using the GRADE approach. Main results: We included five randomized trials that compared fluoroquinolone-containing four-month ATT regimens versus standard six-month ATT regimens and recruited 5825 adults with newly diagnosed drug-sensitive pulmonary tuberculosis from 14 countries with high tuberculosis transmission in Asia, Africa, and Latin Ameria. Three were multi-country trials that included a total of 572 HIV-positive people. These trials excluded children, pregnant or lactating women, people with serious comorbid conditions, and those with diabetes mellitus. Four trials had multiple treatment arms. Moxifloxacin replaced ethambutol in standard four-month, daily or thrice-weekly ATT regimens in two trials; moxifloxacin replaced isoniazid in four-month ATT regimens in two trials, was given daily in one trial, and was given with rifapentine instead of rifampicin daily for two months and twice weekly for two months in one trial. Moxifloxacin was added to standard ATT drugs for three to four months in one ongoing trial that reported interim results. Gatifloxacin replaced ethambutol in standard ATT regimens given daily or thrice weekly for four months in two trials. Follow-up ranged from 12 months to 24 months after treatment completion for the majority of participants. Moxifloxacin-containing four-month ATT regimens. Moxifloxacin-containing four-month ATT regimens that replaced ethambutol or isoniazid probably increased the proportions who experienced relapse after successful treatment compared to standard ATT regimens (RR 3.56, 95% CI 2.37 to 5.37; 2265 participants, 3 trials; moderate-certainty evidence). For death from any cause, there was probably little or no difference between the two regimens (2760 participants, 3 trials; moderate-certainty evidence). Treatment failure was rare, and there was probably little or no difference in proportions with treatment failure between ATT regimens (2282 participants, 3 trials; moderate-certainty evidence). None of the participants given moxifloxacin-containing regimens developed resistance to rifampicin, and these regimens may not increase the risk of acquired resistance (2282 participants, 3 trials; low-certainty evidence). Severe adverse events were probably little or no different with moxifloxacin-containing four-month regimens that replaced ethambutol or isoniazid, and with three- to four-month regimens that augmented standard ATT with moxifloxacin, when compared to standard six-month

ATT regimens (3548 participants, 4 trials; moderate-certainty evidence). Gatifloxacin-containing four-month ATT regimens. Gatifloxacin-containing four-month ATT regimens that replaced ethambutol probably increased relapse compared to standard six-month ATT regimens in adults with drug-sensitive pulmonary tuberculosis (RR 2.11, 95% CI 1.56 to 2.84; 1633 participants, 2 trials; moderate-certainty evidence). The four-month regimen probably made little or no difference in death compared to the six-month regimen (1886 participants, 2 trials; moderate-certainty evidence). Treatment failure was uncommon and was probably little or no different between the four-month and six-month regimens (1657 participants, 2 trials; moderate-certainty evidence). Acquired resistance to isoniazid or rifampicin was not detected in those given the gatifloxacin-containing shortened ATT regimen, but we are uncertain whether acquired drug resistance is any different in the four- and six-month regimens (429 participants, 1 trial; very low-certainty evidence). Serious adverse events were probably no different with either regimen (1993 participants, 2 trials; moderate-certainty evidence). Authors' conclusions: Evidence to date does not support the use of shortened ATT regimens in adults with newly diagnosed drug-sensitive pulmonary tuberculosis. Four-month ATT regimens that replace ethambutol with moxifloxacin or gatifloxacin, or isoniazid with moxifloxacin, increase relapse substantially compared to standard six-month ATT regimens, although treatment success and serious adverse events are little or no different. The results of six large ongoing trials will help inform decisions on whether shortened ATT regimens can replace standard six-month ATT regimens. 9 December 2019. Up to date. All studies incorporated from most recent search. All eligible published studies found in the last search (10 Jul, 2019) were included. Copyright © 2019 The Authors. The Academic Editor is Professor Mical Paul. We thank Vittoria Lutje, the Information Specialist for the Cochrane Infectious Diseases Group (CIDG), for her guidance with the literature search strategy. We are grateful to Paul Garner, CIDG Co-ordinating Editor, for his comments and support. We also gratefully acknowledge helpful comments from an anonymous peer reviewer and from Dr Marylou Murray. We thank the Contact Editor for this review, Mical Paul, and the CIDG statistician, Marty Richardson, for their painstaking peer review and helpful comments. We thank Dr MS Jawahar, lead author of an included trial, for providing further information about methods and recruitment-related data. The editorial base of the Cochrane Infectious Diseases Group is funded by UK aid from the UK government for the benefit of low- and middle-income countries (project number 300342-104). The views expressed do not necessarily reflect the UK government?s official policies. The review was supported by READ-It (project number 300342-104).

This review was undertaken as part of the training course seeking to build capacity on undertaking systematic reviews in India, especially in the context of tuberculosis. The training project was conceived and implemented by the South East Asia office of the International Union Against Tuberculosis and Lung Diseases (The Union) in collaboration with the Central TB Division, Ministry of Health and Family Welfare, Government of India, and Cochrane South Asia. The training was generously supported by the US Agency for International Development (USAID). We also thank the Department for International Development (DFID), UK, for funding the Global Operational Research Fellowship Programme at The Union, Paris, France, in which JT and SS work as Senior Operational Research Fellows.

The editorial base of the Cochrane Infectious Diseases Group is funded by UK aid from the UK government for the benefit of low-and middle-income countries (project number 300342-104). The views expressed do not necessarily reflect the UK government’s official policies.

Abstract
There is great demand for applying prediction tools in any domain of knowledge industry to measure the performance in advance. Here we adopt the possible investigations through data mining experiments with the appropriate dataset based on knowledge profile of UG University students. There are two main steps firstly to extract the highest relevant rules and secondly to construct concurrent execution model that is, colored Petri nets. The objective in this paper is to identify the best accurate rule set to construct the fuzzy Petri nets for specifying and implementing the same by Colored Petri nets. © 2019 Author(s).

Emerging trends of IT industry policies for ensuring women employee retention

(2019) *Indian Journal of Public Health Research and Development*, 10 (12), pp. 291-294.

DOI: 10.37506/v10/i12/2019/ijphrd/191961

Abstract
Today, behaviour of women employees has changed the environment of the private organization. Young women employees always ready to switch over whenever she dissatisfy with any reason in the job. Retention strategy is a powerful recruitment tool. Private organizational issues matters as lost knowledge and training time. HR managers should identify the needs of the women employee and then devises the retention strategies. As different individuals have different priorities does not fit one strategy. HR professionals face the vital challenge to retain talented women employees. Retention strategies are fall into four categories-job enrichment, salary, working conditions and education, addressing these issues this article demands a specialized approach that emerge new fangled women friendly policies which foster gender neutral workplace in developing retention strategies. © 2019, Indian Journal of Public Health Research and Development. Abstract
Diabetes Nephropathy is a major microvascular complication of Diabetes Mellitus and the most common cause of End Stage Renal Disease (ESRD) worldwide. Hyperglycemia, a well recognized pathogentic factor of long term complications of Diabetes Mellitus, generates ROS. This attenuates antioxidative mechanisms through glycation of the scavenging enzymes. Excess amount of ROS modulate activation of protein kinaseC, mitogin activated protien kinares and various cytokines and transcription factors which eventually cause increased expression of extracellular matrix (ECM) genes with progression of fibrosis and end stage renal disease. Therefore, this study was carried out to investigate oxidant and antioxidant status in Diabetic patients for manifesting the progression to diabetic nephropathy. © 2019, Indian Journal of Public Health Research and Development. Effect of CPP ACP and nano hydroxyapatite incorporated GIC on remineralization of dentin

(2019) *Indian Journal of Public Health Research and Development*, 10 (12), pp. 936-941.

DOI: 10.37506/v10/i12/2019/ijphrd/192242

Abstract
The objective of this invitro study was to investigate, whether the remineralization potential of conventional GIC in human dentin could be improved by combining with CPP-ACP and nano hydroxyapatite. Class I cavities were prepared in sound human extracted third molars and they were randomly assigned to 3 groups according to the restorative materials. Group I: Conventional GIC, Group II:Conventional GIC and CPP-ACPand Group III: Conventional GIC powder & Nano hydroxy apatite. The samples were subjected to remineralizationand demineralization cycles for period of 2 weeks. Energy dispersive X-ray analysis was used to evaluate the remineralization. The elemental compositions were analyzed using One way ANOVA, Post Hoc and Mann Whitney tests. The calcium and phosphate concentration were statistically significantly greater in Group III than Group I and II (P<0.05).Nanohydroxy apatite with GIC remineralized the demineralized dentin almost equal to normal dentin. © 2019, Indian Journal of Public Health Research and Development. Abstract
Objective: To evaluate the effect of modifying the liquid component of conventional GIC with 10 v/v % and 50 v/v % Chitosan on fluoride release and flexural strength in comparison to conventional GIC. Method: The liquid component Conventional GIC was modified by adding 10 v/v % and 50 v/v % Chitosan. To evaluate fluoride release, 90 discs of 10*2mm were prepared, stored in 50ml distilled water for 1hr, 24hrs and 1 week and measured in DR-2000 spectrophotometer. To measure flexural strength, 30 samples of 10*2.5*2.5mm were prepared, loaded until fracture in Universal testing machine. Statistical Analysis: One-way analysis of variance and student Newman Keul test were used to analyze the data Results: The accumulated fluoride release at various time intervals were greater for 50 v/v% Chitosan modified GIC than the other groups. Mean Flexural strength of 10 v/v% Chitosan modified GIC was found to be statistically significant than the other groups. Conclusion: Chitosan enhances the Fluoride release and flexural strength properties of conventional GIC. © 2019, Indian Journal of Public Health Research and Development. All rights reserved.

Forcing gender issues and challenges affecting women employees to continue their career in it industry
(2019) *Indian Journal of Public Health Research and Development*, 10 (12), pp. 288-290.

DOI: 10.37506/v10/i12/2019/ijphrd/191960

Abstract
Despite the major advancements women have made in becoming a significant part of the workforce, they are still facing important career development issues. Although many women achieve lower and middle management positions, they seem to hit the “glass ceiling” in many organizations and are denied the most senior levels of upper management. The reasons are multi-dimensional; some women lack the confidence to apply for senior positions; some lack the necessary education or training; and others find themselves excluded from the top positions because of systemic gender bias that exists in some companies. There are plenty of statistics tracking the percentage of women in the workforce, their qualifications and their salaries. But the data doesn’t show us the whole picture. It doesn’t assess how women feel, how they fare in their day-to-day business, the challenges they encounter. And that is why the research embarked on a global task, asking more than 9,500 women across the G20 to identify the top five issues faced at work especially in IT industry. © 2019, Indian Journal of Public Health Research and Development. Abstract
Diabetic Foot ulceration is one of the major devastating complication of diabetes. Diabetic foot ulcers (DFUs) infected with multidrug resistant bacterial strains is often associated with prolonged hospital stay, increased treatment cost, significant morbidity and mortality. DFU infected with Methicillin Resistant Staphylococcus aureus (MRSA) if untreated may lead to amputation. Materials & Method: Type 2 diabetic Subjects (Mean age 56 years)(n=27) with infected foot ulcers were included in his study.After wound debridement, samples were taken from the base of the ulcer using sterile cotton swabs and nasal swabs were also collected from the study subjects and were processed as per standard Microbiological methods. Results: The overall isolation rate of S. aureus in DFU was 18.5%. Among the S. aureus isolates screened for MRSA, all the isolates from the DFU ulcers (n=4) and those isolated from the nares (n=3) of the diabetic subjects were found to be MRSA.Of note, 3 of the study subjects in whom MRSA was isolated from the DFU samples were found to harbour MRSA in their nares. Nevertheless, allthe isolateswere susceptible to linezolid, netillin, gentamicin and amikacin.No significant statistical difference was observed in the antimicrobial resistance percentage among the DFU and nasal isolates. Conclusion: Our study results imply that, screening for MRSA colonisation would better predict a patient's probability of MRSA infection and guide the clinicians in antimicrobial treatment decision making. © 2019, Indian Journal of Public Health Research and Development. Immunomodulatory and mast cell stabilizing potential of ethanol extract of eleusinecoracana L.

(2019) *Indian Journal of Public Health Research and Development*, 10 (12), pp. 980-984. Cited 1 time.

DOI: 10.37506/v10/i12/2019/ijphrd/192251

Abstract
Eleusinecoracanal (seed)(finger millet bran)is rich in dietary fibre (free of glutan) and micronutrients and has been extensively studied for its anti-diabetic, anti-tumorogenic, anti-diarrheal, anti-ulcerative, anti-oxidant and anti-microbial potential. However, the immuno-modulatory potential and mast cell membrane stabilizing ability of E. coracana L (Ragi seeds) needs to be evaluated. Hence, this study was designed to evaluate the ability of ethanol extract of E. coracana L. to potentiate immunomodulation and inhibit mast cell degranulation of human macrophages and mice peritoneal mast cells respectively. Ethanol extraction of E. coracana L (Ragi seeds) was performed by cold percolation method. Assessment of In vitro immunomodulatory activity was carried out using human PMN layer, Candida albicans and morphological criteria was adopted to calculate the phagocytic index. In vitroevaluation of inhibition of mast cell degranulation was determined using isolated mice peritoneal mast cells. In vitro evaluation of phagocytosis revealed that ethanol extract of E. corocana L. (seed) induced vacuolation of human macrophages. Nevertheless, E. corocana L (seed, ethanol extract) (25 mg/mL) was found to inhibit polysorbate 80 induced mast cell degranulation. © 2019, Indian Journal of Public Health Research and Development. Abstract
The tissue dissolution property of irrigating solutions is important for successful endodontic treatment. Sodium hypochlorite (NaOCl) is a well-known tissue dissolvent, but no data have been published on herbal alternative to NaOCl. The purpose of this study was to investigate the pulp tissue dissolution capacity of sodium hypochlorite, ethanolic extract of Drosera rotundifolia and digestive fluid of Nepenthes khasiana. Freshly extracted intact vital teeth, extracted for orthodontic and impaction reasons were collected and stored at – 20 ˚C. The pulp tissues were removed by splitting of the teeth when required. Method: The pulp tissues were randomly divided into 4 groups (n = 10), individual sample was weighed 7 mg each. The groups were as follows, Group I: 5% NaOCl, Group II: digestive fluid of Nepenthes khasiana, Group III: Drosera rotundifolia (ethanolic extract), Group IV: distilled water. The test solutions were added to tubes containing tissue samples, the tissues were removed from the test solutions at 5, 15, 20, 30 min, 1,2,3,4,5,6,7 hr blotted dry with the tissue paper and weighed using precision balance. Results: The results showed complete dissolution of pulp tissue in Group I at 20 minutes, Group II at 7 hr, Group III and IV showed no dissolution of pulp at the investigated time intervals. Conclusion: The digestive fluid of Nepenthes khasiana could be considered as an herbal alternative to NaOCl for pulp tissue dissolution as it completely dissolved the pulp tissue similar to 5% NaOCl, but at different time intervals. © 2019, Indian Journal of Public Health Research and Development. Emerging trends of pharma industry policies for ensuring women retention
(2019) *Indian Journal of Public Health Research and Development*, 10 (12), pp. 338-341.

DOI: 10.37506/v10/i12/2019/ijphrd/191972

Abstract
Today, behaviour of women employees has changed the environment of the private organization. Young women employees always ready to switch over whenever she dissatisfy with any reason in the job. Retention strategy is a powerful recruitment tool. Private organizational issues matters as lost knowledge and training time. HR managers should identify the needs of the women employee and then devises the retention strategies. As different individuals have different priorities does not fit one strategy. HR professionals face the vital challenge to retain talented women employees. Retention strategies are fall into four categories-job enrichment, salary, working conditions and education, addressing these issues this article demands a specialized approach that emerge new fangled women friendly policies which foster gender neutral workplace in developing retention strategies. © 2019, Indian Journal of Public Health Research and Development. Primary Hyperoxaluria-Imaging of Renal Oxalosis
(2019) *Urology*, 134, pp. e3-e4.

DOI: 10.1016/j.urology.2019.09.020

Abstract
Primary Hyperoxaluria is a rare autosomal recessive hereditary disorder due to deficient alanine-glyoxylate aminotransferase enzyme with defective glyoxylate metabolism leading to excessive oxalate production and deposition into the tissues (oxalosis). Deposition of excessive calcium oxalates in nephrons leads to crystallization (nephrocalcinosis) which increases risk for end-stage renal disease. We are presenting a case of primary hyperoxaluria type I confirmed with genetic studies. © 2019 Elsevier Inc.

Abstract
With recent scientific developments, Photodynamic therapy (PDT) offers the promisie to become incorporated into the mainstream of cancer therapy. Noble metal based nano-PDT is increasing due to its advantages in the field of biomedicine. In this study, noble metal based Ag@SiO2 core-shell nanoparticles were synthesized and to confirm the core-shell structure they were characterized by UV–vis, XRD, FTIR, TEM, and EDX. Our data confirm that core-shell type Ag@SiO2 nanoparticles maintain its ability to kill cancer cells upon light irradiation. This shows that SiO2 shell may not only prevent aggregation but it also may enhance the photodynamic activity of Ag nanoparticles. © 2019 Elsevier B.V.

Abstract
Cellulose is the most common resource is present abundantly in most of the organism. Especially in hemp, which is one of the most renewable, sustainable and efficient resources for the protection of bio-based polymeric nanocomposites. Here, cellulose used as a template for surface modified synthesis of polypyrrole grafted cellulose (PPy@C) by in-situ oxidation polymerization with an oxidant ammonium peroxydisulfide (APS) at optimum condition. The structure, morphology, thermal stability, crystallinity and its catalytic properties were analyzed using various instrumental analyses. The objective of this work, PPy@C/GCE exhibit high sensitivity, good stability over the determination of ascorbic acid (AA) in commercial fruits real sample analysis. PPy@C/GCE modified electrode proposed good regression equation, the value of correlation coefficient and low detection limit at wide range of concentration 10–150 μM under optimal DPV condition. The real samples analysis of commercial fruit juices analyzed by PPy@C/GCE and it exhibits good recovery values. © 2019 Elsevier B.V.

Abstract
The Fe3+ ions were replace with Tb3+ ions as highly paramagnetic rare earth element within the structure of Ni0.4Cu0.2Zn0.4Fe2O4 nano-spinel ferrites (NSFs). The structural, magnetic, spectroscopic and optic properties have been studied in details. All products have been synthesized via ultrasonic approach via Qsonica ultrasonic homogenizer, frequency: 20 kHz and power: 70 W for 60 min. No annealing or calcination process was applied for any product. The microstructural analysis of products has been done via X-ray powder diffractometry (XRD) which presented the cubic spinel structure with nanosized distribution of all. The cubic morphology of all products were confirmed by both HR-TEM and FE-SEM. Optical band gap (Eg) values were assessed by applying %DR (percent diffuse reflectance) analysis and Kubelka-Munk theory. The Tauc schemes showed that Eg values are in a narrow range (1.87–1.98 eV). The quadrupole splitting, line width, hyperfine magnetic field, isomer shift values and cation distribution have been determined from 57Fe Mossbauer analysis. The magnetic properties of various nanoparticles have been obtained from VSM (vibration sample magnetometer) measurements at 10 and 300 K (RT). The magnetic results revealed superparamagnetic and soft ferromagnetic traits at 10 and 300 K, respectively. Ms (saturation magnetization) and Mr (remanence) initially increase with increasing Tb3+ substituting level up to x = 0.06 then diminish for further x values. Hc (coercivity) shows an opposite variation tendency of Ms and Mr. The observed magnetic traits are deeply discussed in relation with the structure, morphology, magnetic moments and cation distributions. © 2019 Elsevier B.V.

Abstract
In this report, the impact of tungsten oxide nanowires (noted WO3-NWs) inclusion on the AC susceptibility, DC magnetization and superconducting properties of YBa2Cu3Oy (noted Y-123) was investigated. Non-added and WO3-NWs added to Y-123 samples were produced using solid-state reaction route. Prepared samples were characterized by using numerous techniques, such X-rays diffraction (XRD), scanning electron microscopy (SEM) along with energy-dispersive X-ray (EDX) spectroscopy, electrical resistivity, magnetization hysteresis loops, zero-field cooling and field-cooling (ZFC-FC) magnetizations and AC susceptibility measurements. The successful development of the orthorhombic Y-123 phase was confirmed via XRD and EDX analyses. SEM observations showed that the WO3-NWs provoke an enhancement of the connectivity among grains and reduces the porosity by entering between the grains and filling the voids among them. Measurements of electrical resistivity and ZFC-FC magnetizations verified the manifestation of superconductivity in various samples. The magnetization and intergranular critical current densities (Jcm and Jc,inter) were deduced from various magnetic measurements. Improvements of critical current densities (Jcm and Jc,inter) and flux pinning capability were found with the inclusion of NW-WO3 into Y-123 matrix. © 2019 Elsevier Ltd and Techna Group S.r.l.

Author Keywords

Abstract
In this work, non-added and tungsten oxide nanoparticles (noted WO3-NPs) added to YBa2Cu3Oy (noted Y-123) samples were produced using solid-state reaction approach. The structure, morphology, electrical and magnetic properties were examined by the help of X-ray diffraction (XRD), scanning electron microscope (SEM) and physical properties measurement system (PPMS), respectively. XRD showed that the orthorhombic Y-123 phase was successfully formed. SEM investigations showed the existence of bright nano-entities embedded within the Y-123 matrix for added sample, which are not seen in the non-added one. The measurements of electrical resistivity verified the manifestation of superconductivity in various products. The intragranular and intergranular critical current densities were calculated from the measurements of DC magnetization and AC susceptibility. The strength of pinning centers in the prepared products was evaluated. The obtained findings reveal that WO3-NPs are powerful to improve the flux pinning capacity and superconducting properties of Y-123 material. © 2019 Elsevier B.V.

Abstract
The demand of biomaterials in cardiovascular application was increasing day by day and its utilization is restricted by its mechanical and biocompatible properties. This paper aims to design a novel polyurethane nanocomposite added with juniper and titanium dioxide (TiO2) through electrospinning process. Wettability analysis of the composite showed its improved hydrophobic nature and its fibers were of small in size compared to pure polyurethane. Tensile strength and thermal stability of the composite increased compared to the pure polymeric fibers. Atomic force microscopy denoted the increase in surface roughness of PU with the incorporation of juniper and titanium dioxide. Anti-thrombogenic properties of the developed composites were displayed through the delayed coagulation times. Above all, human dermal fibroblast cells were actively growing without toxic issues making the fabricated material as a widely undisputed choice in cardiac tissue applications. © 2019, © 2019 Taylor & Francis Group, LLC.

Abstract

Lanthanum (Rare earth metal) doped CuS (La@CuS) at different compositions (0%, 1%, 3% and 5% of La) are synthesized by encapsulation of sodium alginate biopolymer using microwave irradiation method. The prepared various compositions of La@CuS are examined by structural characterizations, particle size and identifications of elements from XRD, TEM and EDX spectrum. The surface morphological studies are conformed by SEM and TEM images. Optical properties and characteristics peak are confirmed with UV, FTIR and Raman spectroscopic tools. In addition to that the electrochemical performances are studied using Cyclic Voltammetry (CV), Galvanostatic charge and discharge (GCD) and electrochemical impedance spectroscopy (EIS) investigations. The specific capacitance is found to be 1329 F/g for 5% of La doped CuS nano spheres. © 2019 Elsevier B.V.

Abstract
Aim: To evaluate the therapeutic efficacy of CT Guided Radio Frequency ablation of benign bone tumour-Osteoid osteoma. Materials and Method: 1. SStudy group: Patients who presented with typical history and were clinically diagnosed as Osteoid osteoma were subjected to radiological evaluation. The patients graded their pain at day and night on a visual analogue scale between Grade 0-No pain and Grade 10-Unbearable pain. We evaluated 16 patients of Osteoid osteoma in whom Radio Frequency Ablation (RFA) was performed between November 2015 and October 2016. The lesions were located in the femur (n = 10), tibia (n = 5) and fibula (n=1). 2. SStudy design: Prospective Interventional study 3. SMethod: MDCT guided RFA procedure was performed using a STAR med VIVA RF Generator and cooled tip probe standard technique under spinal anesthesia. Results: Significant pain relief was observed in 15 out of 16 patients on first week post-operative visual analog scale. Immediate complications included a case of minor thermal skin burns in 3 patients, which healed on its own. There were no delayed complications. The average follow-up period was 2-3 months. One patient (6.25%) had persistent pain even after one month, following ablation which was due to residual lesion. Complete pain relief was achieved after a second ablation in that case. Thus, our primary and secondary clinical success rates were 93.8% and 100%, respectively. Conclusion: RFA is a safe, quick, minimally invasive, and extremely effective method for the management of Osteoid osteomas. © 2019, Indian Journal of Public Health Research and Development. Evaluation of urinary iodine and thyroid hormone in hypothyroidism of South Indian population

(2019) *Indian Journal of Public Health Research and Development*, 10 (11), pp. 1591-1597.

DOI: 10.5958/0976-5506.2019.03767.7

Abstract

Aim and objective: The present study was conducted to assess the Urinary iodine excretion levels among hypothyroid patients based on Thyroid profile and to correlate the Urinary iodine excretion with various disorders associated with hypothyroidism. Method: The study group includes 50 control subjects and 100 clinically proven hypothyroidism patients. Histopathological investigations and thyroid scan were taken for all the patients. They were analyzed for Thyroid hormone profile and the Urinary iodine excretion level was determined by Ammonium persulfate method in spot urine sample. Results: Free T4, TSH and Urinary iodine concentration (UIC) were measured for both the control and study group (P = 0.00).The mean Free T4, TSH & UIC for control group was 1.71 ng/dl, 1.41μIU/ml & 150.28μg/L and the mean Free T4, TSH & UIC for test group was 0.85ng/dl, 48.38μIU/ml & 233.74μg/L respectively. A significant positive correlation between Free T4, TSH and UIC was found. Increased Urinary iodine excretion (UIE) was observed in patients with Papillary Carcinoma, Thyroiditis and Multinodular goiter. Conclusion: The findings of the present study reveals that increased excretion of urinary iodine reflects under utilization or impaired iodination by the thyroid gland. © 2019, Indian Journal of Public Health Research and Development. Abstract
Hidradenoma refers to a benign adnexal tumor of apical sweat gland. It is often cutaneous, benign tumor of sweat glands. Other names of it are nodular hidradenoma, eccrine acrospiroma, and solid cystic hidradenoma. Lesions are commonly seen on the head, face, extremities and are rarely seen in oral cavity. Clinical appearance of hidradenoma is not specific, but can be diagnosed histopathologically, after complete removal of the lesion. Histopathologically, it has a striking resemblance to salivary gland pathology. A 75 Year old male patient reported with an extra oral swelling near the lip region. Clinical diagnosis was found to be different when compared to the histopathological diagnosis. Management includes wide local excision. © 2019, Indian Journal of Public Health Research and Development. All rights reserved.

Abstract
Today, behaviour of women employees has changed the environment of the private organization. Young women employees always ready to switch over whenever she dissatisfy with any reason in the job. Retention strategy is a powerful recruitment tool. Private organizational issues matters as lost knowledge and training time. HR managers should identify the needs of the women employee and then devises the retention strategies. As different individuals have different priorities does not fit one strategy. HR professionals face the vital challenge to retain talented women employees. Retention strategies are fall into four categories-job enrichment, salary, working conditions and education, addressing these issues this article demands a specialized approach that emerge new fangled women friendly policies which foster gender neutral workplace in developing retention strategies. © 2019, Indian Journal of Public Health Research and Development. Designing universal primer for the identification of erythromycin and tetracycline resistance genes in oral streptococci

(2019) *Indian Journal of Public Health Research and Development*, 10 (11), pp. 2838-2841. Cited 1 time.

DOI: 10.5958/0976-5506.2019.04054.3

Abstract
Oral streptococci being the early colonizers of oral biofilm have a high impact on the health status of an individual. The resistance of streptococci to erythromycin and tetracycline possess a global threat in oral health by harboring the erm and tet resistant genes which are proved to be correlated with each other. Considering the high prevalence of erm and tet resistance in oral streptococci, identification of universal primers for these genes are necessary to characterize these genes. Our work has put forth a heuristic approach in designing universal primers to detect genetically diverse erm and tet resistant genes in streptococci. The erm and tet primers were validated to be universal among the streptococci group. The universal primers designed for erm and tet generetrieved 100% and 72.7% of sequence similarity of streptococcus deposited in NCBI gene repository. Identification of universal primers for the successful amplification of erm and tet genes of streptococci for the first time will minimize the usage of multiple primers to isolate resistant streptococci for rapid detection of antibiotic-resistant genes. © 2019, Indian Journal of Public Health Research and Development. Salivary secretory proteins-unveiling genetic polymorphism and diseases
(2019) *Indian Journal of Public Health Research and Development*, 10 (11), pp. 2822-2825. Cited 1 time.

Abstract
Saliva, the “mirror of the body,” is an ideal non-invasive source of complex genetic information. The complexity of the salivary peptidome is mainly due to the high number of genetic polymorphisms. This review shows an association between the genetic polymorphisms of salivary secretory proteins and the endangerment of several diseases. Different secretory protein single nucleotide polymorphisms whose genetic positions are related to oral and other diseases are listed from SNPedia deposits and tracked using a variety of techniques. Besides being circulating salivary biomarkers, single nucleotide polymorphisms of salivary secretory proteins acts as a possible genetic susceptibility factor and aids in the early detection and prevention of various oral and systemic diseases including cancer and rare syndromes in a quick and noninvasive manner. This would pave the way for the development of array-based technologies using saliva sample for genetic analysis.

Abstract
Cone Beam Computed Tomography (CBCT) specifically designed for imaging of the dento facial region is a true shift from 2D to 3D imaging. It produces high resolution 3D images in thin, thick or curved slices in axial, saggital and coronal planes. CBCT is a valuable tool for endodontic diagnosis and treatment planning as well as for assessing apical periodontitis, resorption, root fractures, root canal anatomy, perforations and the nature of the alveolar bone around the teeth. © 2019, Indian Journal of Public Health Research and Development. Abstract
The current work aims to optimize the Al-Si alloy reinforced with B4C nanoparticles prepared through powder metallurgy technique. The sample was prepared with different weight percentage 0, 4 and 8; the size of the sample was 20 mm x 20mm and sintered in a furnace upto 500oC with argon gas and their by furnace cooled to room temperature. The samples were brushed to remove the slag present in it, and polished by emery paper. Then the samples were weighed in an electric balancing apparatus to measure the initial weight of the sample before dipping it into acid solution. The weight loss was measured to calibrate the corrosion rate of the samples for 9 days. Response surface methodology was designed for three factors at three levels with a response as corrosion rate. The Analysis of Variance (ANOVA) was used to identify the most influencing factor on corrosion rate. The normal probability plot, residual plot, and desirability plot demonstrates the influence of corrosion rate of the composites. © BEIESP.

Abstract
Abdominal Aortic Aneurysm (AAA) is a substantial enlargement of the aorta that weakens the blood vessel wall leads to atherosclerotic disease. Aneurysms are dangerous because when it rupture causing hemorrhage. This leads to insufficient blood flow from the aorta to the different organs of the human body. Based on the extracted features from the AAA and the demographic data of the patient, the clinical management team will decide the optimal treatment procedure. The screening of AAA is done by ultrasound scan to know the type of the aneurysm present. Diameter with 05.05 cm or more, it should be viewed seriously. The AAA images were segmented using connected components labeling technique. Early detection of aneurysm can be repaired with proper treatment so that it does not rupture. The CT images of AAA were read and denoisedto preserve the edges using image processing software. Based on the histogram of the filtered image the AAA area was identified and threshold the image to view clearly the dilated part. The area, major axis length, minor axis length of the AAA images were calculated to understand the flow dynamics and to predict the rupture of the AAA wall using MATLAB, LabVIEW and python program. © BEIESP.

Abstract
This paper summary of heat transfer characteristics and nano fluids mechanics by using single phase convection techniques. Gas having less thermal conductivity compare than the liquids having high thermal conductivity. The heat transfer enhancement improved by using nano fluids Al2O3 compared with base water. The heat transfer enhancement was analysed with plain tube and twisted tape inserts with nano fluids. The experimental investigation was analysed and reading was taken to improve the heat transfer and friction flow characteristics. The Reynolds number varies from different ranges with plain water and Nano fluids. The experimental record of nano fluid heat transfer value was increased with 2.89 percentage compare with the experimental record of plain water. The nano fluids has more concentration than the plain water. © BEIESP.

Abstract
In the present work, three types of polybenzoxazines were synthesized using caprolactam-based diamine (CPA-NH2) and formaldehyde with different phenols, namely 4-fluorophenol, cardanol, and phenol, under appropriate experimental conditions. The molecular structure of the benzoxazine monomers was confirmed by FTIR, 1H, and 13C NMR spectroscopic techniques. Polybenzoxazines were obtained through ring-opening polymerization of benzoxazine monomers, and their formation was confirmed by FTIR spectroscopy. The elemental composition and morphological behavior of polybenzoxazines were characterized by SEM-EDAX and AFM techniques. The naturally occurring cardanol- and caprolactam-based diamine (CPA-NH2)-based benzoxazine was selected for detailed studies. The synthesized SiO2–TiO2 nanohybrid reinforcement was functionalized with 3-aminopropyltrimethoxysilane (3-APS) and reinforced with cardanol-based benzoxazine (CPBz) monomer. The resulted nanocomposites were studied for their corrosion protection behavior against mild steel surface along with thermomechanical (TGA and DMA) and morphological (SEM, XRD, and TEM) properties. The results obtained from electrochemical impedance analysis indicate that the 5 wt% of F–SiO2–TiO2 of reinforced CPBz exhibits an effective corrosion-resistant behavior toward surface of steel specimen than that of other samples. © 2019, American Coatings Association.

Abstract

Nanostructured sodium alginate (Na Alg.) assisted CuS nanoparticles are synthesized by graceful microwave irradiation method. The prepared CuS nanofiller is mixed by means of magnesium ion conducting PVA:PVP blend electrolyte films with different compositions using solution casting method. All compositions are characterized to analyse its structural and thermal properties through X-ray Diffraction (XRD), Fourier Transform infrared (FTIR) and Thermo gravimetric and Differential Thermal analysis (TG/DTA) techniques. The electrical conductivity and dielectric properties are analyzed through electrical impedance measurements. Nanofillers mixed Mg:PVA:PVP blend polymer solid electrolyte exhibit maximum protonic conductivity of 1.847 × 10−3 Scm−1. Proton and magnesium ion based conducting solid electrolytes are more applicable for energy storage devices applications. © 2019 Elsevier B.V.

Author Keywords

CuS nanofiller; Mg:PVA:PVP; Mg+ blend electrolyte films; Microwave irradiation; Protonic conductivity

Index Keywords

Conductive films, Copper compounds, Dielectric properties, Differential thermal analysis, Electric conductivity, Electric impedance measurement, Fourier transform infrared spectroscopy, Irradiation, Magnesium castings, Magnesium compounds, Metal ions, Microwave irradiation, Polyelectrolytes, Potentiometric sensors, Sodium alginate, Synthesis (chemical); Electrical conductivity, Electrical impedance measurement, Electrolyte films, Fourier transform infrared, Nanofiller, Polymer solid electrolytes, Protonic conductivities, Solution-casting method; Solid electrolytes
