Abstract
Neuroinflammation and oxidative damage are the two main malfactors that play an important role in the pathogenesis of experimental and clinical Parkinson's disease (PD). The current study was aimed to study the possible anti-oxidant and anti-inflammatory effects of the methanolic extract of Agaricus blazei (A. blazei) against rotenone-induced PD in mice. Male Albino mice were randomized and divided into the following groups: control, treated with rotenone (1 mg/kg/day), co-treated with rotenone and A. blazei (50, 100, and 200 mg/kg b.w.), and treated with A. blazei alone (200 mg/kg b.w.). After the end of the experimental period, behavioral studies, biochemical estimations, and protein expression patterns of inflammatory markers were studied. Rotenone treatment exhibited enhanced motor impairments, neurochemical deficits, oxidative stress, and inflammation, whereas oral administration of A. blazei extract attenuated the above-said indices. Even though further research is needed to prove its efficacy in clinical studies, the results of our study concluded that A. blazei extract offers a promising and new therapeutic lead for treatment of PD. © 2017, © 2017 Informa UK Limited, trading as Taylor & Francis Group.

Author Keywords
Agaricus blazei; Dopamine; Neurodegenerative disease; Neuroinflammation; Oxidative stress

Index Keywords
Agaricus blazei extract, brain derived neurotrophic factor, catalase, catecholamine, dopamine, glutathione, glutathione peroxidase, immunoglobulin enhancer binding protein, interleukin 1beta, interleukin 6, nitroblue tetrazolium, rotenone, superoxide dismutase, thiobarbituric acid reactive substance, tumor necrosis factor, antiinflammatory agent, antioxidant, catalase, dopamine, glutathione, glutathione peroxidase, rotenone, superoxide dismutase, thiobarbituric acid reactive substance; animal experiment, animal tissue, antiinflammatory activity, antioxidant activity, Article, behavioral science, biochemical analysis, controlled study, drug induced disease, drug isolation, effective dose (pharmacology), enzyme activity, high performance liquid chromatography, inflammation, male, motor dysfunction, mouse, neuromuscular function, neuroprotection, nonhuman, oxidative stress, Parkinson disease, priority journal, protein expression, Western blotting, Agaricus, animal, chemistry, deficiency, drug effect, metabolism, mitochondrion, Parkinson disease; Agaricus, Animals, Anti-Inflammatory Agents, Antioxidants, Catalase, Dopamine, Glutathione, Glutathione Peroxidase, Male, Mice, Mitochondria, Oxidative Stress, Parkinson Disease, Secondary, Rotenone, Superoxide Dismutase, Thiobarbituric Acid Reactive Substances

Chemicals/CAS
brain derived neurotrophic factor, 218441-99-7; catalase, 9001-05-2; dopamine, 51-61-6, 62-31-7; glutathione, 70-18-8; glutathione peroxidase, 9013-66-5; nitroblue tetrazolium, 298-83-9; rotenone, 83-79-4; superoxide dismutase, 37294-21-6, 9016-01-7, 9054-89-1; Anti-Inflammatory Agents; Antioxidants; Catalase; Dopamine; Glutathione; Glutathione Peroxidase; Rotenone; Superoxide Dismutase; Thiobarbituric Acid Reactive Substances

Abstract
Solid polymer electrolytes (SPEs) consisting of polyethylene oxide (PEO) /Polyvinyl pyrrolidone (PVP) complexed with sodium nitrate have been synthesized by solution casting technique. Structural studies were carried out using X-ray diffraction (XRD) measurements. The complex formation between the bonding of polymers and the salt were confirmed by Fourier Transform Infrared (FT-IR) spectral data. The ionic conductivity and dielectric response of the SPEs were studied within the frequency range of 42 Hz–1 MHz at the temperature range of 303–363 K. The maximum ionic conductivity was found to be 6.157 × 10−7 S/cm at 303 K for PEO (67 wt %) /PVP (27 wt %)/NaNO3 (6 wt%). The dielectric properties were also studied using the complex dielectric permittivity spectra of the SPE films. The higher dielectric permittivity was obtained due to accretion of ionic charges at lower frequencies. The surface morphology of the polymer blend electrolyte film complexed with sodium nitrate was studied using Scanning Electron Microscopy (SEM). © 2018 Elsevier B.V.

Abstract
Nanorod shaped cobalt molybdate (CoMoO4) electro-catalysts synthesized by microwave combustion route using urea as the fuel. The formation of monoclinic nanocrystalline structure, metal-oxygen (M–O) and chemical bonding was confirmed by X-ray powder diffractometry (XRD), Fourier transform infrared (FT-IR) and Raman spectroscopy, respectively. Scanning electron microscope (SEM) associated with energy dispersive X-ray (EDX) and high-resolution transmission electron microscope (HR-TEM) were used to confirm the morphology, elemental composition and particle size of the samples, respectively. The optical and defects were confirmed by the UV–vis. absorption and photoluminescence (PL) spectroscopy at room temperature (RT). The room temperature magnetic behaviors of product were investigated by vibrating sample magnetometer (VSM). Surface binding energy and element confirmation were examined by X-ray Photoelectron spectroscopy (XPS). The electrochemical (EC) performance was studied by cyclic voltammetry (CV), galvanostatic charge-discharge analysis (GCD) and electrochemical impedance spectroscopy (EIS) analysis. The CV curve proved the existence of redox pairs and the supercapacitor nature exhibited by the EIS (Nyquist plots). The GCD studies provided the non-symmetrical discharge curves and the highest specific capacitance (Csp) of ~ 133 F/g were acquired at a constant discharge current density (1 mA/cm−2). The cyclic stability investigations revealed capacitance retention of about 100% after 1000 cycles, proposing the prospective usage of CoMoO4 in energy-storage devices. © 2018 Elsevier Ltd and Techna Group S.r.l.

Author Keywords
CoMoO4 nanocatalyst; Electrochemical studies; Magneto-optical properties; Microwave combustion; Specific capacitance

Abstract
Background: Insulin resistance is communal in patients with PCOS-Polycystic Ovary Syndrome. Serum copper, zinc, magnesium are measured and it is correlated with insulin resistance. Aim of Study: The present study intended to determine correlations among insulin Resistance and minerals like copper, zinc, magnesium inpatients with PCOS. Methodology: The subjects were identified from gynecology OPD of private medical college in Tamilnadu. The study involved 200 female of age 15-45 years (100female had PCOS and the other 100 female were controls). Results: HOMA was meaningfully higher in female with PCOS in contrast with Control. There was a significant correlation of copper, zinc and magnesium with insulin resistance. It was observed that the levels of copper and zinc increases with patient showing insulin resistance while magnesium was lowered in the same. Conclusion: There is a significant correlation between the levels of copper, zinc, magnesium and IR in patients with PCOS. © 2018, Advanced Scientific Research. All rights reserved.

An effective method to remove noise in EEG signal using wavelet packet transform
(2018) *International Journal of Pharmaceutical Research*, 10 (4), pp. 793-799.

[a] Bharath Institute of Higher Education and Research, Chennai, India
[b] SASTRA Deemed University, Thanjavur, India

Abstract
Electroencephalogram (EEG) sign is the recording of impulsive electrical interest of the mind over a small period of time. Signals are made through attack of neurons in the brains that are measured and calculated through EEG. EEG indicators are low voltage indicators that are contaminated with the aid of various types of noises that are additionally known as artifacts. As these alerts are used to diagnose diverse varieties of mind related diseases like narcolepsy, Sleep apneasyndrome, Insomnia and parasomnia it will become necessary to make those indicators free from noise for correct evaluation and detection of the sicknesses. Various noise elimination strategies together with ICA-Independent Component Analysis, PCA-Principle Component Analysis, Wavelet packet transform and Wavelet Packet Transform are to be had and can be carried out in mat lab. All these strategies may be used for EEG signal de-noising through noise to the original sign and then put in force the noise reduction method and their overall performance can be evaluated based on the elements which includes SNR and MSE. In this article, an arithmetical method for putting off artifacts from EEG demos via wavelet packet transform without thinking about SNR calculation is proposed. © 2018, Advanced Scientific Research. Abstract
The streaming data technologies play a vital role in real-time applications. To analyze the data, Random sampling with replacement has a problem in drawing inferences from the small random sample, while sampling without replacement is not preferable to sub-streams that correspond to different sources. Hence, to effectively mine the data streams from heterogeneous sources, this work proposes Adaptive Reservoir sampling Of stream In a Time window (AdROIT) which partitions the streams in a window on time factor and determines the size of historical data on reference window regarding the data changes in the observation window. By measuring the standard deviation of the partitioned window, we can identify whether the changes in statistical properties of a data stream is due to one or multiple sources. The AdROIT allocates the reservoir sampling size to the source, ensures the adaptability, updates the ensemble classifier with dynamically estimated weight, decides accuracy of each member regarding weight. The experimental results show that the AdROIT provides better classification and mining results over heterogeneous data streams. The AdROIT increases the precision by 16%, compared to the Chain sampling under a high degree of heterogeneity. Under the same scenario, the proposed scheme increases the recall by 30 %, more than that in Chain sampling. In high degree of heterogeneity, the Chain sampling utilizes 40kb for storage, more than that of Chain sampling. Finally, the high window size reduces the execution time in AdROIT by 15 seconds and improves the recall by 40%, compared to the Chain sampling. © 2018, International Journal of Intelligent Engineering and Systems.

Abstract
Introduction: The cranial capacity indirectly reflects the volume of the brain, hence may predict the mental ability of an individual. Aim: To estimate the cranial capacity and correlate it with Body Mass Index (BMI) and academic performance of first-year students of a Medical College in Chennai, Tamil Nadu, india. Materials and Methods: A total of hundred first year MBBS students aged between 17 and 19 years were selected for the present study from Sree Balaji Medical College and Hospital, Chrompet, Chennai, India. Cranial capacity and BMI were calculated by standard methods. The average academic performance during the year was obtained by calculating the average of the total marks secured in the academic year. All the above data were tabulated and analysed statistically by using Pearson's correlation test and Paired Student t-test. Results: The cranial capacity had no significant correlation with the academic performance in the present study. However, the BMI had a significant correlation with cranial capacity; this may be because larger cranial capacity is required for controlling larger muscular body mass. Conclusion: The present study showed a larger cranial capacity was related with increased BMI and hence may be helpful in the medicolegal and anthropological examination to find the relations between cranial capacity and age, height, body weight and BMI. There was no significant correlation between academic abilities with cranial capacity. © 2018, Journal of Clinical and Diagnostic Research. All rights reserved.

Abstract
A highly efficient photovoltaic nanocomposite device is demonstrated by fabrication of structural clusters of silver nanoparticles (Ag NPs) on silicon solar cells via a boil deposition method. The efficiency of silicon solar cell was augmented by coating Ag NPs ultra-thin-film deposition on silicon solar cell. Chemically synthesized silver NP's, their consumption on a silicon thin layer and the operation of photovoltaic nanocomposite device were characterized by using several electron probe microscopic pectroscopic and spectrometric techniques viz. x-ray diffraction (XRD), scanning electron microscopy (SEM), high resolution transmission electron microscopy (HR-TEM), Photoluminescence, UV–visible absorption, dielectric, current vs. voltage (I~V) and capacitance vs. voltage (C~V) characteristics. Poly-dispersed nature of 'Ag' nanoparticles established the anisotropy of these NPs when coated on silicon solar cells. Their efficiency enhancement was confirmed from HR-TEM image via time-domain finite-difference technique to deliberate the particle distribution effect on an ultra-thin film of silicon solar cell, indicating the sufficient enrichment in the efficiency of solar cell. Furthermore, the current work explores the developement of novel glass frits for utilization in next generation of high efficiency smart solar cells. © 2018 Elsevier B.V.

Kaushik Pal was born in India. He received his Ph.D. from University of Kalyani, Nadia, (India). Most significant prestigious awards " Marie-Curie Experienced Researcher (Postdoctoral Fellowship) " offered by the European Commission at Aristotle University of Thessaloniki, Greece and " Brain Korea National Research Foundation Visiting Scientist Fellowship " at CNU, South Korea , achieved in his career. He was appointed " Senior Postdoctoral Fellow " at Wuhan University, China and after he obtained the most prestigious position " Scientist & Faculty CAS Fellow " by Chinese Academy of Science . Most Recent, he has been working as a " Research Professor & (Independent Scientist) ", at the Department of Nanotechnology, Bharath University (BIHER), Chennai . Based of his research background he selected "Editor-in-Chief" of the International peer reviewed journals and publishers ' Pan Standford ', En Press , and ' InTech ' as well as edited significant numbers of the book chapters, partially reviewed 85-research articles . Prof. Pal is an excellent group leader as well as associate member in various scientific communities, reorganizations and professional bodies. Since last year organized and chairperson around 10-National/International events/symposiums/conferences/workshops and himself contributed around 8-Keynote & 18-Invited lectures and attained distinguish chief guest in worldwide Nanoscience research community.

Abstract
In this study, spinel ZnFe2O4 nanoparticles (NPs) were synthesized by citrate sol-gel route using nickel nitrates, ferric nitrates and citric acid by annealing at 900, 1000, and 1100◦C. We reported the structural and magnetic properties (including Mössbauer analysis) for anisotropy ZnFe2O4 NPs annealed at different temperatures. Fourier transform infrared (FT-IR) and X-ray powder diffraction (XRD) were utilized to analyze the structural properties of magnetic nanoparticles (MNPs). Morphological features of resultant MNPs were examined by scanning electron microscopy (SEM). The observed XRD results displayed that the crystallite size increased from 38.60 to 49.28 nm with increasing the annealing temperature in a distinct linear trend. The enhancement of saturation magnetization of the uniaxial ZnFe2O4 NPs was studied and varied from 1.28 to 1.66 emu/g as the annealing temperature increases. The Mössbauer spectra results show that ZnFe2O4 ferrites were paramagnetic in nature at room temperature (RT). © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
In this study, spinel ZnFe2O4 nanoparticles (NPs) were synthesized by citrate sol-gel route using nickel nitrates, ferric nitrates and citric acid by annealing at 900, 1000, and 1100◦C. We reported the structural and magnetic properties (including Mössbauer analysis) for anisotropy ZnFe2O4 NPs annealed at different temperatures. Fourier transform infrared (FT-IR) and X-ray powder diffraction (XRD) were utilized to analyze the structural properties of magnetic nanoparticles (MNPs). Morphological features of resultant MNPs were examined by scanning electron microscopy (SEM). The observed XRD results displayed that the crystallite size increased from 38.60 to 49.28 nm with increasing the annealing temperature in a distinct linear trend. The enhancement of saturation magnetization of the uniaxial ZnFe2O4 NPs was studied and varied from 1.28 to 1.66 emu/g as the annealing temperature increases. The Mössbauer spectra results show that ZnFe2O4 ferrites were paramagnetic in nature at room temperature (RT). © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
An unusual approach is reported herein to fabricate magnetic hematite (α-Fe2O3) decorated electrochemically reduced graphene oxide (α-Fe2O3@erGO) nanocomposite. The method utilizes direct electrochemical reduction of self-assembled, ex-situ synthesized α-Fe2O3 anchored GO to erGO (α-Fe2O3@erGO) on glassy carbon electrode (GCE) for selective detection dopamine (DA), an important biomarker of Parkinson's disease. The formation of α-Fe2O3@erGO/GCE has been confirmed by XPS and Raman spectroscopy. α-Fe2O3@erGO modified GCE exhibits synergistic catalytic activity nearly 2.2 and 5 fold higher than α-Fe2O3@GO and other modified electrodes, respectively towards oxidation of DA. The fabricated sensor exhibited linear dynamic ranges over 0.25 − 100 μM in response to DA with a LOD of 0.024 μM (S/N = 3), LOQ of 0.08 μM (S/N = 10), and a sensitivity of 12.56 μA μM–1 cm–2. Finally, the practical analytical application of the proposed α-Fe2O3@erGO/GCE was investigated for the determination of DA in commercially available pharmaceutical formulation and human serum samples, and showed satisfactory recovery results towards DA. © 2018 Elsevier B.V.

Abstract
Enteric fever has emerged as an important infectious disease in the early 19th century. This study is carried out in search of an accurate diagnostic method enabling direct observation of antibody binding to antigen profiles, avoiding problems with non-specific antibody binding. To develop an inhouse immunoblot method for detection of anti salmonella antibody against antigens like LPS and S.typhi culture filtrates and compare with Widal in search of an accurate diagnostic assay for typhoid fever. Cross-sectional comparative study for a period of 1 year in a tertiary care hospital. 100 cases having clinical suspicion of typhoid fever and 40 controls (20 healthy persons and 20 non- typhoidal febrile patients) were studied. Subjects were investigated by blood culture, Widal test and Immunoblot and the results were compared. SPSS version 20 was used to analyze the results.Out of 100 cases 58(58%) were positive by widal and 74(74%) by immunoblot.Sensitivity and Specificity was found to be 58%, 85% for widal and 74%, 95% for Immunoblot respectively.Positive and negative predictive values were found to be 90.63%, 44.74% for widal and 97.37%, 59.38% for Immunoblot.Immunoblotting procedure incorporating Salmonella typhi culture filtrates is found to be more sensitive than the Widal agglutination assay for providing evidence of infection with Salmonella typhi. © 2018 Journal of Pure and Applied Microbiology. Abstract
In this paper welding characteristics of AA6063 and AA7075 dissimilar aluminum alloy joints has been investigated. The central goal of the experiments is to identify the suitable method of welding and the optimal welding process parameters for mechanical properties. The weld joint fabricated by means of friction stir welding and metal inert gas welding with various functional parameters. FSW and MIG welded joint mechanical properties were compared with each other to understand the merits and demerits of the functional variables used for joining of aluminum alloys. Superior tensile strength of 150.32Mpa, elongation of 14.62% and impact strength 22 joule were obtained with FSW welded joints made by taper profile tool. This occurred due to the size of the heat affected region of FSW was narrower than MIG welded joints. Hence results show that FSW provides the joints with superior mechanical properties and it's suitable for joining of aluminum alloys. © IAEME Publication.

Abstract
A microbial fuel cell (MFC) is a bioreactor presents an advanced eco-friendly technology that converts chemical energy in the chemical bonds in organic compounds to electrical energy through catalytic reactions of microorganisms under anaerobic conditions. It has been known for many years that it is possible to generate electricity directly by using bacteria to break down organic substrates. The recent energy crisis has invigorated interests in MFCs among educational researchers as some way to generate electrical power or hydrogen from biomass without a net carbon emission into the ecosystem. MFCs may be utilized in waste product treatment facilities to break down organic matters. MFCs can also be used in wastewater treatment facilities to organic matters. It was also studied for applications as biosensors for biological oxygen demand monitoring. Power output and Coulombic efficiency are found to be significantly affected by the types of microbe in the anodic chamber of an MFC, configuration of the MFC and operating conditions. Presently, real-world applications of MFCs are limited because of their low power density level of several thousand mW/m2. This paper presents a review on factors affecting performance of microbial fuel cells. © IAEME Publication.

Abstract
Incorporation of oils in to the polymer matrix results in the improvement of physicochemical and biocompatible properties. A novel polyurethane based composite bone scaffold was fabricated by electrospinning using sunflower and neem oil for the first time. Scanning electron microscopy (SEM) revealed the mean fiber diameter of the electrospun nanocomposite was decreased with the addition of sunflower oil (816 ± 129.54 nm) and sunflower/neem oil (739 ± 130.922 nm) into the PU matrix (890 ± 116.9115 nm). The strong interactions between PU, sunflower oil and neem oil were observed through Fourier transform infrared spectroscopy (FTIR) and thermogravimetric analysis (TGA). Contact angle analysis depicted the hydrophobic (PU/sunflower oil - 112° ± 1) nature and with the incorporation of neem oil it shifted to hydrophilic (PU/sunflower oil/neem oil - 61.67° ± 2.517) behavior. Further, the tensile strength analysis showed the improvement in the mechanical strength with the addition of sunflower oil (10.62 MPa) and sunflower/neem oil (11.67 MPa) in to the PU matrix (7.12 MPa). In addition, the developed composites exhibited reduced hemolytic index percentage and enhanced blood clotting time through coagulation studies. Moreover, the cytocompatibility investigation revealed the non-toxic nature of the fabricated nanocomposites with human dermal fibroblast (HDF) cells than the pristine PU. Hence, the developed PU based composites rendering better physio-chemical and cytocompatible properties can serve as an alternate substitute for bone tissue engineering applications. © 2018

Abstract
Chromium-substituted strontium nano-hexaferrites, SrCrxFe12-xO19 (0.0 ≤ x ≤ 1.0), were produced by the hydrothermal route. The structure, morphology, optical and magnetic properties were studied. Crystal structure, spinel phase and functional groups were verified using X-ray diffraction and Fourier Transform Infrared spectroscopy. The average crystallites size is ranging between 50 and 67 nm. Scanning electron microscopy observations indicated that the multi-grains of the particles are aggleromated and are hexagonal in shape. The isotherm plots obtained from the nitrogen physisorption experiments showed that the mesopore area and the total pore volume decreased progressively with increasing the Cr3+ content. Besides, the band gap energy (Eg) decreases from 1.75 to 1.43 eV. The magnetic hysteresis loops showed that the produced nano-hexaferrites exhibit hard ferromagnetic-like (FM) behavior. Compared to the pristine SrFe12O19 product, the deduced saturation (Ms) and remanent (Mr) magnetizations, the coercivity (Hc) and the magnetocrystalline anisotropy field (Ha) increase for lower Cr3+ content (x ≤ 0.4) and then decrease as the Cr3+ content further increases. The squareness ratio Mr/Ms are ranging between 0.5 and 0.6, suggesting the single domain nano-sized particles with uniaxial anisotropy for various synthesized products. Mossbauer analysis was done to determine the quadrupole splitting, the isomer shift, and the hyperfine magnetic field values of all products. © 2018 Elsevier Ltd and Techna Group S.r.l.

Abstract
The effect of the crystalline phase PVP encapsulated titanium dioxide (TiO2) nanoparticles (NPs) to optimize the optical properties and photocatalytic activity were comparatively investigated at different calcination temperatures. The synthesized products were characterized using instrumental techniques, such as powder X-ray diffraction (XRD), Fourier-transform infrared spectroscopy (FT-IR), transmission electron microscope, energy dispersive X-ray, ultraviolet–visible (UV–visible), photoluminescence (PL) and vibrating sample magnetometer. The functional groups were identified by the FT-IR analyses. XRD result showed that the anatase and rutile phase structure of TiO2 NPs was confirmed. The spherical shaped morphology is predicted by the SEM analysis. The optical properties of the TiO2 NPs were studied by the UV–visible and PL analysis. The magnetic behavior of the TiO2 NPs was studied. Photocatalytic activity of TiO2 NPs was tested by the degradation of MeB dye under UV light irradiation. In addition, the chemical oxygen demand removal follows the photo degradation in behaviour was observed. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract

Nickel molybdate (NiMoO4) nanoparticles (NPs) were synthesized by a simplistic one-pot microwave combustion method using urea as the fuel. The produced NPs have been examined by powder X-ray diffraction (XRD), Fourier transform infrared (FT-IR) analysis, scanning electron microscope (SEM), energy dispersive X-ray (EDX), high-resolution transmission electron microscopy (HR-TEM) analysis. Further, optical and electronic properties were determined by UV-Visible and Photoluminescence (PL) analysis, respectively. The magnetic performance of the NiMoO4 NPs was investigated by vibrating sample magnetometer (VSM) and the surface chemical composition was identified by X-ray photoelectron spectroscopy (XPS). The electrochemical activities of the NiMoO4 NPs were studied by cyclic voltammetry (CV), electrochemical impedance spectroscopy (EIS) and galvanostatic charge/discharge (GCD) analysis. From the results, the CV curves indicated the occurrence of redox couples and besides with the EIS data (Nyquist plot), confirmed the supercapacitor nature of the synthesized NiMoO4. The prepared NiMoO4 exhibits a high specific capacitance and rateability. This electrode grants a high specific capacitance of 450 F g−1 at 2 mA cm−2 and the well permanency with a cycling proficiency of 94% after 1000 cycles. These results clearly showed that the synthesized NiMoO4 NPs have potential application for the forthcoming flexible and lightweight energy storage. © 2018 Elsevier Ltd and Techna Group S.r.l.

Abstract
Nanospinel Li2xCu1-xAlyFe2-yO4 ferrites with composition x = y = 0.0, 0.2, 0.3 and 0.4, were successfully synthesized via hydrothermal method. The effect of co-substitution (Li and Al) on structural, morphological and magnetic properties of CuFe2O4 nanoparticles were investigated using Powder X-ray Diffraction (XRD), Fourier-Transform Infrared spectroscopy (FT-IR), Scanning Electron Microscopy (SEM), Vibrating Sample Magnetometer (VSM) and Mossbauer spectroscopic techniques. The cation distribution of all composition was calculated. Both XRD and FT-IR analyses confirmed the synthesis of single-phase spinel cubic product for all the substitutions. Mossbauer investigation showed that the Li1+ and Al3+ ions occupied B-sites. Nonetheless, some amounts of Li1+ occupy A-site. The magnetization hysteresis loops M (H), revealed that the final products with x, y = 0.0, 0.3 and 0.4 exhibit superparamagnetic (SPM) behavior at room temperature, however the composition x, y = 0.2 displays a ferromagnetic-like (FM) behavior. The saturation magnetization (Ms) reduces with rising the Li and Al contents. Compared to pristine CuFe2O4 spinel, the remanent magnetization (Mr), coercive field (Hc) and the magneto-crystalline anisotropy fields (Ha) improved for products synthesized with x, y = 0.2 and then decrease for x, y = 0.3 and 0.4. The squareness ratio Mr/Ms are less than 0.500, which suggest the single domain nanoparticles with uniaxial anisotropy for Li2xCu1–xAlyFe2-yO4 (0.0 ≤ x, y ≤ 0.4) nanoparticles. The magneto-crystalline anisotropy constant (Keff) value is improved for Li0.8Cu0.6Al0.2Fe1.8O4 (i.e. x, y = 0.2) magnetic nanoparticles and then decreased for higher Li and Al contents, due to the replacement of Cu and Fe ions with respectively Li and Al ions. © 2018 Elsevier Ltd and Techna Group S.r.l.

Author Keywords
Cation distribution; Hyperfine interaction; Magneto-optical properties; SEM; Spinel ferrites

Abstract
The preparation of copper oxides/reduce graphene oxide (Cu 2 O-CuO/rGO) nanocomposites via a simple hydrothermal route is reported. The Cu 2 O-CuO/rGO nanocomposites are synthesized through redox reaction between CuCl 2 ·2H 2 O and graphene oxide (GO) without using any reducing agent. The X-ray diffraction (XRD) and X-ray photoelectron spectroscopy (XPS) results authenticate the formation of Cu 2 O-CuO/rGO nanocomposites. It is evident from the high resolution transmission electron microscopy (HRTEM) images that the Cu 2 O-CuO nanorods are firmly wrapped on the rGO sheets. The electrochemical properties are investigated employing cyclic voltammetry (CV), galvanostatic charge-discharge (GCD) and electrochemical impedance spectroscopy (EIS) techniques. The Cu 2 O-CuO/rGO1 nanocomposites demonstrate highest specific capacitance of 436.6 F g −1 at 1 A g −1 and excellent cyclic stability with no variation in the capacitance even after 1000 cycles. © 2018 Elsevier B.V.

Abstract
Dengue virus is a mosquito borne belongs to the Flaviviridae family, are the causative agents of dengue fever. Globally about 50 million cases of dengue fever reported in which 500000 cases of dengue haemorrhagic fever (DHF) each year which require hospitalization. The present study was aimed to explore the potential of Andrographis paniculata extracts against the Dengue fever. Totally 86 patients who infected with dengue virus were enrolled for this study and divided into two groups. In which one group 43 were administered with Andrographis paniculata extract as complementary drug along with normal symptomatic medication. About 25ml of nila vembu extract juice was administered orally twice a day (morning and evening) for 7 consecutive days (1 week). Result showed average platelet count at the time of hospitalization was 83575/μL of blood and it was significantly raised to 151539/μL and 182182/μL of blood in the patient with normal medication and normal medication with Andrographis paniculata extract respectively. Administration of Andrographis paniculata extract showed significant rise in the platelet count when compared with normal medication subjects in the present study. Still, this is a preliminary study and required large clinical trials, identification and isolation of the active compounds and mechanism of action from this valuable Andrographis paniculata extract are warranted which may help in control / treat against the Dengue fever. © 2018, Indian Journal of Public Health Research and Development. Performance improvement of DSR protocol by controlling overhead in MANET
(2018) *International Journal of Mechanical Engineering and Technology*, 9 (8), pp. 686-690.

[a] Department of CSE, Bharath Institute of Higher Education and Research, Chennai, India
[b] Department of CSE, Pondicherry University CC, Puducherry, India

Abstract
Ad Hoc networks usually consist of mobile nodes, which are characterized by lower computing and energy resources. For real-time streaming applications, choosing the shortest path for these kinds of sessions is insufficient. Such networks must operate energy-efficiently to maximize the lifetime of mobile devices and applications. In this paper we develop an energy-ware and delay-aware routing approach for mobile ad hoc network (MANET). Dynamic Source Routing (DSR) protocol is a reactive source routing protocol designed specifically for mobile ad hoc networks (MANETs). In DSR protocol the network traffic is increased due to the source routing technique used for routing. In large networks intermediate nodes increases due to many source destination pairs generated, which further increases the routing overhead and energy consumption of a network in DSR. In order to improve the network scalability of DSR protocol, in this paper modifications are proposed known as HR-DSR i.e. Header Reduction DSR protocol to reduce the increased routing overhead length, due to longer routes of source-destination pairs by limiting hop count of a route. Thus modification will effect to reduce energy consumption due to routing overhead. © 2018 IAEME Publication.

Abstract
The Major problem in wireless sensor network to achieve an energy efficient routing protocol. Energy consumption is a critical problem in wireless sensor network for nodes and network life. For increasing lifetime of networks energy saving is must and also energy saving routing protocols are very important in wireless sensor networks. More the radius more is energy requirement. Hence if radius is less then energy consumption will be less. In this paper a RSES routing protocol is presented which adjusts the radius according to threshold value, by using this protocol energy consumption is minimized. The on-demand route discovery process is used for routing table information. After remaining energy level reaches, a certain threshold, node reduces its transmission radius and again modification is done in order to achieve less energy consumption under the premise of some certain coverage ratio. By using this algorithm Energy consumption can be minimized. Using RSES, network lifetime and has a balanced network load, energy saving and routing traffic. © 2018 IAEME Publication.

Fungal-mediated deterioration and biodegradation study of low-density polyethylene (LDPE) isolated from municipal dump yard in Chennai, India

(2018) *Energy, Ecology and Environment*, 3 (4), pp. 229-236. Cited 6 times.

Abstract

Low-density polyethylene (LDPE) is a conventionally used polymer and possesses diverse applications in various industries due to its low cost, excellent strength, and numerous mechano-thermal properties. Unfortunately, the deliberate and unconscious release of excess polythene in the environment causes serious ecological threat. To deal with this issue, biodegradation of LDPE was considered using different fungal strains, namely Aspergillus flavus, Aspergillus versicolor, and Fusarium solani isolated from local municipal dump yard in Chennai, India. For degradation study, the polymers were subjected to microbial cultures for 60 days under laboratory conditions. The extent of the degradation was quantified in terms of the weight loss of the LDPE films, pH changes of the culture medium, mineralization, and analysed by field emission scanning electron microscopy (FESEM) and Fourier transform infrared (FTIR) spectroscopy. FESEM micrographs revealed the fungal colonization on the polythene matrix due to their metabolic activities, whereas FTIR spectra showed the changes in chemical nature of the polymer films and confirmed the biodegradation of LDPE. By comparing the reduction in dry weight of LDPE strips and Sturm test results, A. versicolor strain was found to be a potential LDPE-degrading candidate than A. flavus and F. solani and, hopefully, can address the global issue of polymer pollution. © 2018, Joint Center on Global Change and Earth System Science of the University of Maryland and Beijing Normal University and Springer-Verlag GmbH Germany, part of Springer Nature.

Abstract
In this study, undoped and Al-doped BiFeO3 (Bi1−xAlxFeO3: x = 0.0, 0.05, 0.1 and 0.15) nanoparticles were successfully prepared by solution combustion method using urea as the fuel. The obtained product was sintered at 550 °C for 2 h to obtain pure phase. The as-prepared samples were characterized by powder XRD, FT-IR, FE-SEM, EDX, TEM, UV-Vis absorption and PL spectroscopic analysis. Powder XRD study revealed that the synthesized nano-powders exhibit rhombohedral structure. The average crystallite size of the samples decreased from 56.25 to 48.55 nm with “x”. Surface morphology of the samples were analyzed by FE-SEM and TEM micrograph technique and the grain distribution was not quite homogeneous and observed agglomeration, which is mainly due to the magnetic interaction among the particles. EDX analysis showed that the presence of Bi, Fe, O and Al peaks only without any form of impurity peak in all products. PL spectroscopy showed a high intense peak at 464 nm, which was attributed to blue emission. Antibacterial activity of Bi1−xAlxFeO3 nanoparticles was found to be enhanced with increase in Al doping concentration as it caused a reduction in the grain size of the samples. © 2018 Elsevier Ltd and Techna Group S.r.l.

Effect of Cr3+ substitution on AC susceptibility of Ba hexaferrite nanoparticles

(2018) *Journal of Magnetism and Magnetic Materials*, 458, pp. 204-212. Cited 82 times.

Abstract

In this study, nano-sized particles of BaCrxFe12−xO19 (0.0 ≤ x ≤ 1.0) hexaferrite were fabricated through citrate auto gel combustion process and the impact of Cr-ion substitution on ac magnetic susceptibility properties of Ba-hexaferrite were explored. X-ray powder diffraction (XRD) measurements approved the purity of prepared samples and showed a reduction of the average crystallite size with increasing the content of Cr. Transmission electron microscopy (TEM) observation indicated the hexagonal morphology of all samples. AC susceptibility measurements displayed a frequency dependence of the magnetic responses. These measurements indicated that there are strong magnetic interactions (which is the highest for BaCr0.3Fe11.7O19 NP) between particles which cause a superspin glass-like (SSG) behavior at low temperatures. Estimating the values of loss power density revealed an increase of loss power density with increasing Cr-substitution element. The relative sensitivity of the prepared MNPs to the variation of applied frequency is very influenced by Cr-substitution and is highest in BaCr0.3Fe11.7O19 MNPs, suggesting that this sample can be considered as magnetic nanomaterial for hyperthermia and for many other applications. © 2018 Elsevier B.V.

The effect of loading condition on peri-implant bone stress in regular and narrow diameter implants: A three dimensional finite element analysis

(2018) *Drug Invention Today*, 10 (7), pp. 1243-1245.

[a] Department of Prosthodontics, Tagore Dental College, Rathinamangalam, India
[b] Department of Dental Sciences, Bharath University, BIHER, 173,New Agaram Rd, Chennai, 600 073, India

Abstract
Introduction: The mechanisms responsible for biomechanical implant failure are not fully understood owing to complications from many related factors. One such important factor is the implant loading condition. Aim: The aim of this study was to evaluate the effect of loading condition on stress distribution in the peri-implant area. Materials and Methods: Three dimensional finite element models created to replicate completely osseointegrated endosseous titanium implants were used for the purpose of stress analysis. Two study models consisting of a regular platform group and a narrow platform group were used with a standard bone density and loaded using the ANSYS workbench software to calculate the Von Mises and Principal (maximum tensile and minimum compressive) stress under vertical and oblique loading conditions. Results: The von Mises, compressive, and tensile stresses in the peri-implant bone were lower under vertical loading compared to the oblique loading condition. Conclusion: Vertical loading yielded a positive result with regard to lowering of peri-implant bone stress levels, in standard bone qualities when compared to oblique loading models. © 2018 JPR Solutions.

Abstract
Introduction and Aim:Chronic kidney disease (CKD) is associated with an enhanced oxidative stress and deep modifications in lipid and lipoprotein metabolism. First, many oxidized lipids accumulate in CKD and were shown to exert toxic effects on cells and tissues. Approximately, 50% of hemodialysis (HD) patients die from cardiovascular events. Hyperlipidemia is the main risk factors for cardiovascular events. Progressive renal failure is associated with the lipoprotein abnormalities and dyslipidemia. To study Oxi LDL and lipid profile level changes in chronic renal failure and MHD patients. Materials and Methods: Present study were divided into four groups, Group-I: healthy controls 100, Group-II: CRF Patients – 50, Group-III: CRF patients on haemodialysis (Pre HD)-50 and Group-IV: CRF patients on haemodialysis (Post HD) 50. The obtained serum samples were used for biochemical analysis for estimating oxi-LDL and lipid profile levels. Results:Oxi LDL, serum cholesterol, LDL, and TG levels were significantly increased in CRF, pre and post HD patients when compared with controls. Oxi LDL, TG levels were significantly increased in CRF when compared with post HD. Serum Cholesterol, LDL and HDL levels were slightly decreased in CRF when compared with Post HD. The p-value <0.001 is comparatively highly significant. Conclusion: In conclusion, the CRF patients on dialysis are at risk of developing cardiovascular disease. © 2018 Indian Association of Biomedical Scientists. All rights reserved.

Abstract
Microbial fuel cells (MFC) are an environmental friendly energy conservative technology that not only helps in generating power from waste but also in remediating the environmental pollution. This paper reviews some technological aspects and developments of microbial fuel cells. A brief history of abiotic to biological fuel cells and subsequently, microbial fuel cells is presented. Secondly, the development of the concept of microbial fuel cell into a wider range of derivative technologies, called bio electrochemical systems, is described by introducing briefly microbial electrolysis cells, microbial desalination cells and microbial electro synthesis cells. The focus is then shifted to electroactive biofilms and electron transfer mechanisms involved with solid electrodes. Carbonaceous and metallic anode materials are then introduced, followed by the discussion on electro catalysis of the oxygen reduction reaction and its behavior in neutral media. Cathode catalysts based on carbonaceous, platinum-group metal and platinum-group-metal-free materials are presented, along with membrane materials with a view to future directions. © IAEME Publication.

Abstract
Objective: To study the prevalence of Group A Streptococcal (GAS) carriers among healthy school children residing at Chennai. Methods: A total of 730 school children were screened and enrolled to this study. Two throat swabs were collected from all the children irrespective of their symptoms. Throat swabs were cultured and bacterial culture was isolated and confirmed by streptococcal group identification kit. Beta haemolytic streptococci isolates were further sero-grouped by agglutination tests by using specific antisera. Results: 730 school children between the age of 5 to 15 years were enrolled in this study. The mean age of the study group was 7.6 years. Out of the 313 culture positive cases, 217 (29%) were Group A Streptococci, 64 (8%) were Group B Streptococci, 18(2.4%) were Group C Streptococci,2(0.27%) were Group D Streptococci, 1(0.1%) were Group F Streptococci, 2 (0.27%) were Group G Streptococci and 9(1.2%) were mixed Group C and F Streptococci. Among the 29% GAS positive children, 64% were transient carriers, 27% were recurrent carriers and 9% were chronic carriers. Conclusion: All the GAS positive cases were referred to Primary Health Centre for treatment. Identification of the GAS and treating them, not only prevents them from developing non-suppurative complications, but also prevent the spread of GAS to their family members and other children. © 2018, Indian Journal of Public Health Research and Development. Abstract

In the perspective of selenium as an antioxidant and anti-carcinogen, so far no strong intervention trials with selenium over radiation-treated oral squamous cell carcinoma cases have been conducted, to examine the response of the disease and the subsequent biochemical alterations. In the present study, untreated oral cancer cases (Gp II) were compared with radiation-treated groups with and without selenium (Gp IIa, IIb), forward to find the trace elements and cancer biomarkers status, at a follow-up of 6 months. Severe alteration in the trace elements levels of Se, Cu, Fe, Zn, Na, K, Ca, Cl, were noticed in Gp II. Though Gp IIa showed slight improvement, administration of selenium (Gp IIb) improved the level of all these elements to a greater extent ($p < 0.001$). GpII and IIa showed increased level of bio markers 5'-nucleotidase, PschE, LAP, γ-GTP, LDH, SGOT, SGPT, ACP, ALP, CPK, TNF, CEA, AFP, Scc-Ag. The greater extent of restitution to near normalcy was observed in patients given selenium (Gp IIb) ($p < 0.001$). Owing to the fact that selenium scavengers oxidants and hence decelerate carcinogenesis by eliminating tumors, so the tumor released constituents into the systemic circulation declined significantly. Therefore, the outcome of the study suggests selenium as a valuable therapeutic measure as adjuvant for oral cancer patients undergoing cancerocidal radiotherapy. © 2018 Asian Pacific Organization for Cancer Prevention.

Economic analysis of distributed generation with photovoltaic systems
(2018) *International Journal of Pharmaceutical Research*, 10 (3), pp. 528-536. Cited 6 times.

Abstract
During the recent past, the interest towards the adoption of Distributed Generation (DG) has increased greatly among the electric power system utilities. It has been well established that installation of PV Generation at the load points in a distribution system is great advantages for both consumers and the utilities. The question arises whether the maximum beneficiary is the Utility or the consumer and who must bear the cost. This research analyses the economics of the DG with PV Systems, taking a typical 400V distribution system. A detailed procedure adopted for performing the economic analysis is presented in this paper. Benefits considered includes Saving in the energy losses, Energy substitute by the PV system, Capacity release in the Feeders and in the Transformer. The PV system is installed at the selected consumer load points, based on the size and location of the loads. Discounted Cash Flow technique is used to assess the economics of the system, by computing the Internal Rate of Return. The paper presents clearly the advantages of using PV Generating systems in the Power Distribution System, quantifying economic benefits both for the Utilities and for the Customers with supporting data. © 2018, Advanced Scientific Research. Abstract
Objective: This study was aimed to inhibit the sulfite reductase using naturally obtained secondary metabolites of common plants Azadirachta indica and Lawsonia inermis. Methods: The active ingredients of neem and henna were selected and the.sdf files of these were downloaded from PubChem database. Converted the.sdf files to.pdb files with the help of OPENBABEL software which is prerequisite to dock. The three-dimensional structure was incurred from the template of homology of sulfite reductase using MODELLAR software version 9.0. Docking of sulfite reductase with the ligands was performed using iGEMDOCK and Autodock Vina softwares. The physicochemical, pharmacokinetic, drug-likeness, lead-likeness, and toxicological properties were obtained by SWISSADME and admetSAR online tools. Results: The active ingredients show an excellent affinity with the sulfite reductase which obtained was tabulated and the significant properties of a ligand were showing that these can be an investigational new drug entity. Conclusion: In this research, it can concluded that the secondary metabolites obtained from plants were inhibiting the induction of sulfite reductase thereby inhibiting Sulfite Assimilation Pathway leads to commove the amino acid metabolism of organism which shows unique in fungi. © 2018 The Authors.

Abstract
Introduction: Idiopathic Pulmonary Fibrosis (IPF) is a chronic and progressive, condition that is due to aberrant wound healing response following repetitive alveolar injury. Though traditionally viruses have played a key role in altering the wound healing cascade, the role played by bacteria in the pathogenesis of IPF is unclear. If there is a recurrent bacterial isolate in sputum or bronchial wash appropriate antibiotic both prophylactically and therapeutically can help prevent the decline in lung function and morbidity. This is particularly relevant in the treatment since it involves immunosuppressives during exacerbations. Aim: This study analyses the sputum for bacterial isolates in patients with acute exacerbation of IPF and aims to find the significance of such association. Materials and Methods: Sputum samples of 60 patients who came with acute exacerbation of IPF to a Tertiary Medical College and Hospital between February 2015 to March 2016 were analysed. Patients who were unable to produce sputum and who had received antibiotics for the present exacerbation prior to admission were excluded. Expectorated sputum samples were collected in wide mouth sterile containers and were subjected to gram staining and culture using blood agar after assessing the sputum quality. Chi-Square tests were used to find the significant association between the bacterial isolates in the sputum samples. Results: Among the 60 patients, there were isolates in 78.3% (n=47) and rest had no isolates. Streptococcus pneumoniae was isolated in 12 patients and Escherichia Coli in 13 patients and these were found to have significant association statistically in patients presenting with acute exacerbation of IPF. Whereas the rest of the isolates like Klebsiella (n=9), Haemophillus influenza (n=8), Enterococcus (n=2) and Moraxella catarrhalis (n=3) were found to have insignificant association. Conclusion: Preserving the lung functions in patients with IPF is the basis of treatment. Whether infectious causes play a role in attenuating lung function and treating these with prophylactic antibiotics needs to be seen with larger studies in different geographic areas. © 2018, Journal of Clinical and Diagnostic Research. Abstract
Introduction: Urinary incontinence is defined as involuntary loss of urine that represents both hygienic and social problem to the individual. Prevalence of urinary incontinence in women is nearly 30 to 40% in middle aged and 50% in older women. There are some risk factors associated with urinary incontinence such as age, childbirth, pregnancy, surgery, lifestyle habits, neurological problem, menopause, obesity, pelvic organ prolapsed etc. Some studies suggested that urinary incontinence has been related with BMI, races, age, smoking, alcohol intake, physical activity. Aim: The study aimed to find out the prevalence of urinary incontinence among different aged women with vaginal delivery, lower segmental caesarean section, diabetic and hypothyroidism and its impact on quality of life. Materials and Methods: A total of 240 women were selected from 300 volunteers based on the inclusion criteria of six months after delivery either a vaginal delivery or lower segmental caesarean section and females taking medication for hypothyroidism and diabetes for maximum of 5 years. Exclusion criteria were patients who underwent recent abdominal surgeries, any recent fracture, long standing disease, uncooperative patient and neurological or psychological problems. They were divided into 4 groups, 60 in each group. After getting the consent from the patients, assessment form and questionnaires were given and to be filled by the sample and asked to answer the entire question ensuring confidentiality. The materials used were Questionnaires for Urinary Incontinence Diagnosis (QUID), Incontinence Impact Questionnaire short form (IIQ-7) and Incontinence Severity Index (ISI). Results: The study showed that the prevalence of urinary incontinence was higher among women with Group C (Diabetic) followed by Group A (Vaginal delivery), Group B (Lower segmental caesarean section) and Group D (Hypothyroidism. It showed invariable effect on the quality of life of the women. Conclusion: The study concluded that the prevalence of urinary incontinence among the four groups of women is higher in Group C (diabetic) followed by Group A (vaginal delivery), Group B (lower segmental caesarean section), and Group D (hypothyroidism). The urge incontinence was more prevalent than the stress incontinence. However, it also showed that there is an impact on the quality of life of the affected women. Thus, the null hypothesis is rejected and alternate hypothesis is accepted. © 2018, Journal of Clinical and Diagnostic Research. All rights reserved.

Abstract

In this study, NiFe2O4 nanoparticles (NPs) were fabricated via auto citric acid sol–gel route at three different temperatures (900, 1000 and 1100 °C). X-ray diffraction (XRD) and Fourier transform infrared were utilized to analyze the structural properties of magnetic nanoparticles (MNPs). XRD patterns reflect the formation of spinel ferrites without the existence of any kind of secondary phases. Morphological features of resultant MNPs were characterized by scanning electron microscopy. The XRD results show that the crystallite size increases from 30.75 to 42.32 nm with increasing the temperature of the calcination process in a distinct linear trend. The enhancement of the saturation magnetization and magnetic moment of the uniaxial NiFe2O4 NPs were studied and varying from 35 to 40 emu/g and 1.47–1.68 μB, respectively, as the temperature increases. Mössbauer parameters for different calcination temperature have been determined. The occupation ratio of Ni2+ ions at the A sites decreases from 53 to 49% with increasing calcination temperature from 900 to 1100 °C. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract

In this study, NiFe2O4 nanoparticles (NPs) were fabricated via auto citric acid sol–gel route at three different temperatures (900, 1000 and 1100 °C). X-ray diffraction (XRD) and Fourier transform infrared were utilized to analyze the structural properties of magnetic nanoparticles (MNPs). XRD patterns reflect the formation of spinel ferrites without the existence of any kind of secondary phases. Morphological features of resultant MNPs were characterized by scanning electron microscopy. The XRD results show that the crystallite size increases from 30.75 to 42.32 nm with increasing the temperature of the calcination process in a distinct linear trend. The enhancement of the saturation magnetization and magnetic moment of the uniaxial NiFe2O4 NPs were studied and varying from 35 to 40 emu/g and 1.47–1.68 μB, respectively, as the temperature increases. Mössbauer parameters for different calcination temperature have been determined. The occupation ratio of Ni2+ ions at the A sites decreases from 53 to 49% with increasing calcination temperature from 900 to 1100 °C. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
Aswagandharishtam is classical medicine for diseases pertaining to nervous system and digestive system prepared by a number of plants and plant parts. The present work is to know the types of biomolecules present in it by GC MS analysis. Aswagandharishtam was procured from standard Ayurvedic outlet and was subjected to Gas Chromatography Mass Spectrometry after due processing.The GC MS analysis of Aswagandharishtam has shown some promising molecules like Prostaglandin A2, Cholesterol, Piperine, Gentamicin a, d-Mannose, Eugenol, Pipradrol among others, which have activities similar to that of Aswagadharistham. This is a preliminary report where some clue about the various types of biomolecules present in Aswagandharishtam was obtained. Further work is on to prove the efficacy of this medicine by other parameters. Published by Oriental Scientific Publishing Company. © 2018.

Author Keywords
Aswagandharishtam; Cholesterol; D-Mannose; Eugenol; GC MS; Piperine

Index Keywords
1 (3 acetamidophenyl) 3 (2,2,2 trichloro 1 isovaleramidoethyl) 2 thiourea, 20beta dihydroprogesterone, 3 phenylpropanol, asarone, ayurvedic drug, cholesterol, cyclopropanecarboxylic acid derivative, dichloroacetic acid, e 2 octadecadecen 1 ol, eugenol, folic acid, gentamicin, geranyl vinyl ether, mannose, monoamine oxidase inhibitor, oleic acid, palmitic acid, phenol, piperine, pipradol, plant medicinal product, propionitrile, prostaglandin A2, pyridine, pyrrolidine derivative, squalene, stearic acid, tramadol, unclassified drug, unindexed drug, vaccenic acid; Acorus calamus, antibacterial activity, anticonvulsant activity, antidiabetic activity, antifungal activity, antiinflammatory activity, antimicrobial activity, antineoplastic activity, antiulcer activity, Article, bacteriostasis, Berberis aristata, Cinnamomum, Curcuma longa, Cyperus rotundus, ginger, Hemidesmus indicus, herbicidal activity, ionization, mass fragmentography, molecular weight, nonhuman, Piper (plant), Plumbago zeylanica, retention time (chromatography), Santalum album, temperature, Withania somnifera

Chemicals/CAS
20beta dihydroprogesterone, 145-15-3; asarone, 494-40-6; cholesterol, 57-88-5; dichloroacetic acid, 13425-80-4, 2156-56-1, 79-43-6; eugenol, 97-53-0; folic acid, 59-30-3, 6484-89-5; gentamicin, 1392-48-9, 1403-66-3, 1405-41-0; mannose, 31103-86-3, 3458-28-4; oleic acid, 112-80-1, 115-06-0; palmitic acid, 57-10-3; phenol, 108-95-2, 3229-70-7; piperine, 94-62-2; pipradol, 467-60-7, 71-78-3; propionitrile, 107-12-0; prostaglandin A2, 13345-50-1; pyridine, 110-86-1; squalene, 111-02-4, 7683-64-9; stearic acid, 57-11-4, 646-29-7; tramadol, 27203-92-5, 36282-47-0; vaccenic acid, 143-25-9, 693-72-1

Abstract
The present investigation was performed in South Indian Populations to determine the hotspot mutation frequency in Oral Squamous Cell Carcinoma (OSCC) patients with PIK3CA gene Exon 9 and Exon 20 and its correlations with help of their clinical characteristics leading to these mutations. PI3KCA belongs to a group of regulatory heterodimeric lipid kinase which is involved in proliferation of cells, apoptosis and as well in metastasis which is controlled by PIK3CA gene is subjected to high frequency of somatic mutation in various tumors including OSCC. Methods: Total of 25 OSCC patients samples comprising of male and female subjects from Government tertiary care Centre were included in this study. Tumor specimen samples were collected and amplified for PIK3CA gene by PCR and subjected to genomic DNA Sequencing. Results: Our findings showed total of 20% of oncogenic frequency in PIK3CA gene. We also observed two hot spot mutations (E545K) in exon 9 gene and three hot spot mutations (H1047Q, H1047Y, H1048Q) in exon 20 gene in our study populations. Conclusion: Based on our findings it may be concluded that PIK3CA gene Exon 9 and Exon 20 contributes to a major role in pathogenesis on OSCC among South Indian populations may act as therapeutic target for a anticancer drug for the treatment OSCC. . Cheap natural fibers as composite material for automobiles - An experimental research
(2018) *International Journal of Mechanical Engineering and Technology*, 9 (6), pp. 182-185.

[a] Department of Mechanical Engineering, B.S. Abdur Rahman University, India
[b] Department of Mechanical Engineering, Bharath University, India

Abstract
Natural fibers reinforced composite materials are used to reinforce the matrix in the form of polymer for improving the mechanical and tribological properties. Since these kind of fibers are environmental and Eco-friendly also they are very cost effective when compared with synthetic fiber reinforced composite materials. The abundant availability of natural fiber in India at very low cost and they are very easy to manufacture and they are suitable for the automobile industry to make any kind of component. The Natural fiber like hemp/flax, coconut fiber with different combinations needs to be treated chemically to improve the best bonding between the fiber surface and polymer matrix. The natural fibers which are chemically treated exhibits better and improved properties than the untreated fiber one. Therefore the Natural fiber reinforcements had given best results in impact, toughness/strength. This experimental research explains about research and best development in the improved properties of natural fibers in the vehicle industry. © IAEME Publication.

Abstract
DC-DC control transformation utilized as a part of industry and different applications where the interest for smaller power supplies develops significantly. Conventional DC-DC converters have moderately poor voltage direction. Notwithstanding, the resounding DC-DC converters have various focal points for DC-DC control transformations with various combinations like LCC, LCL, and LCLC, etc. a fourth request Resonant Power Converter (LCLC) topology is chosen, and the relentless state strength of the converter is investigated utilizing state space approach. To enhance the execution of the proposed DC-DC thunderous converter shut circle control is actualized using SPARTAN 3E FPGA controller. © TJPRC Pvt. Ltd.

Abstract

In modern era, the great interest and demand among chemists and researchers for metal nanoparticles is increasing in the application of biomedical fields, textiles, cosmetics and various sectors. Consequently, the present study reports an eco-friendly, cost-effective, rapid and easy method to produce environment-friendly metal nanoparticles to prevent exhaustion of metal resources. In this context, gold and silver metal nanoparticles were green synthesized using the Root Extract of Coleous forskohlii (RECo) as capping and reducing agent. The synthesized gold (GNPs) and silver nanoparticles (SNPs) were characterized using UV–Visible spectrophotometer, High-resolution transmission electron microscopy (HR-TEM), Particle size analysis (PSA), Fourier-transform infrared spectroscopy (FT-IR) and X-Ray Diffractometer (XRD). Their clinical importance was analysed using anti-oxidant assay (DPPH - 2,2-diphenyl-1-picrylhydrazyl and Phosphomolybdenum PMA) and cytotoxicity (MTT assay) against HEPG2 (liver cancer cell lines). Further, the antimicrobial activity against two microorganisms were tested using disc diffusion method against Proteus vulgaris pathogen and Micrococcus luteus pathogen. RECo-GNPs and SNPs were found to be stable in aqueous medium for a longer time and exhibited favorable anti-oxidant, anti-bacterial and anti-cancer activity. The phytoconstituents present in the root extract of Coleous forskohlii was elucidated using GC–MS analysis. © 2018 Elsevier B.V.

Author Keywords

Coleus forskohlii; GC–MS; Gold and silver nanoparticles; Green synthesis; Root extract; Therapeutic

Index Keywords

1,1 diphenyl 2 picrylhydrazyl, Coleus forskohlii extract, gold nanoparticle, molybdenum, plant extract, silver nanoparticle, tetracycline, unclassified drug, antiinfective agent, antioxidant, gold, metal nanoparticle, plant extract, silver; antibacterial activity, antimicrobial activity, antineoplastic activity, antioxidant activity, aqueous solution, Article, Coleus, Coleus forskohlii, concentration response, controlled study, disk diffusion, DPPH radical scavenging assay, drug stability, drug synthesis, Fourier transform infrared spectroscopy, green chemistry, Hep-G2 cell line, high resolution transmission electron microscopy, human, human cell, mass fragmentography, Micrococcus luteus, MTT assay, nonhuman, particle size, plant root, priority journal, Proteus vulgaris, ultraviolet spectrophotometry, X ray diffraction, cell survival, chemistry, drug effect, infrared spectroscopy, metabolism, Plectranthus, transmission electron microscopy; Anti-Infective Agents, Antioxidants, Cell Survival, Disk Diffusion Antimicrobial Tests, Gold, Green Chemistry Technology, Hep G2 Cells, Humans, Metal Nanoparticles, Micrococcus luteus, Microscopy, Electron, Transmission, Plant Extracts, Plant Roots, Plectranthus, Proteus vulgaris, Silver, Spectrophotometry, Ultraviolet, Spectroscopy, Fourier Transform Infrared, X-Ray Diffraction

Chemicals/CAS

1,1 diphenyl 2 picrylhydrazyl, 1898-66-4; molybdenum, 7439-98-7; tetracycline, 23843-90-5, 60-54-8, 64-75-5, 8021-86-1; gold, 7440-57-5; silver, 7440-22-4; Anti-Infective Agents; Antioxidants; Gold; Plant Extracts; Silver

Abstract
Well-defined ultra-thin 'wire' like cadmium sulfide (CdS) nanostructures have been synthesized by applying simple cost-effective hydrothermal route. The content of nanostructures modifies the nature of surface interaction between two liquid crystal (LC) components as revealed by optical and electrical investigation. Those synthesized nanowires have an average diameter of about 7–10 nm and length up to several micrometers region. A possible mechanism has been proposed and the addition of cataionic surfactant cetyltrimethylammonium bromide (CTAB) into the two mixed-solvents would play an important role on the growth dynamics of the desired product. Those CdS-nanowires dispersing LC was found a remarkable signature on the nucleation and provides a more fundamental approach to modify the crystallographic configuration of host nanostructures. Polarizing optical microscopy (POM) revealed temperature dependent various phases appearence in different textural patterns are the proof the significant influence of CdS nanomaterials complete homogenious dispersion with host LC-matrix. Most observed phenomena are discussed in terms of a new smectic ordering labeled as 'Smectic X*', which is sandwiched between the traditional 'Nematic' and convectional 'Smectic C*' phases. This feature article deals with dielectric relaxations, rotational viscosity, spontaneous polarization in the smectic C phase have been analyzed. A range of remarkable responses of the capacitance with voltage in a Preisach model, fourfold dipolar species in hybrid nanocomposites matrix as well as bi-stable DC switching also offering recent breakthroughs in next generation smart display (LCD) and novel switchable device. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

Detection of aggregatibacter actinomycetemcomitans leukotoxin and fimbria-associated protein gene genotypes among periodontitis patients and healthy controls: A case-control study

(2018) *Dental Research Journal*, 15 (3), pp. 185-190. Cited 1 time.

DOI: 10.4103/1735-3327.231861

Abstract

Background: Aggregatibacter actinomycetemcomitans has been reported in higher proportions in subgingival microbiota of individuals with aggressive periodontitis (AgP) compared with those with chronic periodontitis (ChP) and healthy controls. The major virulence factors are the ones that help in colonization and evasion of host's defenses. Hence, this study was aimed to assess the prevalence of A. actinomycetemcomitans 16S rRNA and its virulent genotypes (leukotoxin [lktA] and fimbria-associated protein [fap]). Materials and Methods: In this case- control study We performed periodontal examination and measured probing depth and clinical attachment level (CAL). Subgingival plaque samples from 200 (ChP: n = 128 and AgP: n = 72) periodontitis patients and 200 healthy controls were screened for the presence of A. actinomycetemcomitans 16S rRNA, lktA, and fap genotypes by polymerase chain reaction. The prevalence of genotypes between periodontitis patients and healthy controls was compared with Pearson's Chi-square test. P < 0.05 was considered statistically significant. Results: Mean pocket probing depth and CAL were high as compared to the healthy controls. The prevalence of A. actinomycetemcomitans in ChP (n = 128), AgP (n = 72), and healthy individuals (n = 200) was 32.0%, 61.1%, and 2.5%, respectively. A. actinomycetemcomitans lktA genotype prevalence was 71.8% among periodontitis patients, while A. actinomycetemcomitans fap genotype showed 31.8% prevalence. The prevalence of these genotypes was insignificant in healthy controls. Conclusion: The high odds ratio for A. actinomycetemcomitans prevalence suggests its strong link to periodontitis. Detection of A. actinomycetemcomitans lktA + genotype may be a useful marker for AgP as its prevalence was found to be high in AgP. © 2018 Dental Research Journal | Published by Wolters Kluwer - Medknow.

Abstract
Objective: To investigate the probiotic characteristics, anti-Candida activity, and antibiofilm attributes of Hentak derived Lactobacillus pentosus strain LAP1. Design: The probiotic properties of strain LAP1 was depicted by adapting standard protocols. The anti-Candida and antibiofilm properties of isolate were determined using agar well diffusion assay and ELISA reader test, respectively. The time-kill assay was performed using viable colony count assay. Further, the co-aggregation property of strain LAP1 was determined based on standard methodology. Results: Strain LAP1 exhibited not only tolerance to acidic pH but also showed resistivity ($P \leq 0.05$) to simulated gastric juice exposure. Similarly, the strain was able to tolerate bile salt, showed hyperproteolytic activity, and also depicted susceptibility to most of the antibiotics tested. Auto-aggregation phenomenon (37.5–60%), hydrophobicity nature (42.85%), and survival potentiality of strain LAP1 under freeze-dried condition (9.0 ± 0.01 log CFU/ml) made the isolate a promising probiotic candidate. Cell-free neutralized supernatant (CFNS) of strain LAP1 exhibited potent antifungal activities against C. albicans, C. tropicalis, and C. krusei with arbitrary unit of 150 ± 4.34, 200 ± 5.21, and 130 ± 5.13 AU/ml, respectively and depicted remarkable reduction in the biofilm formation of respective Candida sp. in a concentration dependent manner. Moreover, time-kill assay data provided the growth inhibition of all Candida sp. in a time dependent manner. Additionally, strain LAP1 revealed significant co-aggregate percentage with C. albicans, C. tropicalis, and C. krusei. Conclusions: L. pentosus strain LAP1 exhibited a good probiotic characteristics, potent anti-Candida activity, and significant antibiofilm property that could be undoubtedly recommended for its vast applications not only in food industries but also as biotherapeutic agent against Candida infections in pharmaceutical industries. © 2018 Elsevier Ltd

Author Keywords
Anti-Candida; Antibiofilm; L. pentosus; Probiotic; Time-kill assay

Index Keywords
antifungal agent, antiinfective agent, bile acid, peptide hydrolase, probiotic agent; bacterial count, biofilm, Candida, candidiasis, chemical phenomena, drug effect, growth, development and aging, Lactobacillus pentosus, microbial sensitivity test, microbial viability, pH, physiology, stomach juice; Anti-Bacterial Agents, Antifungal Agents, Bile Acids and Salts, Biofilms, Candida, Candidiasis, Colony Count, Microbial, Gastric Juice, Hydrogen-Ion Concentration, Hydrophobic and Hydrophilic Interactions, Lactobacillus pentosus, Microbial Sensitivity Tests, Microbial Viability, Peptide Hydrolases, Probiotics

Chemicals/CAS
peptide hydrolase; Anti-Bacterial Agents; Antifungal Agents; Bile Acids and Salts; Peptide Hydrolases

Abstract
Cu2+ ion substituted nanocrystalline BaFe12O19 [Ba1 − xCuxFe12O19 (0.0 ≤ x ≤ 0.5)] hexaferrite powders were synthesized by sol–gel combustion route and its effects on structure, morphology and magnetic properties of barium hexaferrite (BaFe12O19) were presented. X-Ray Powder Diffraction (XRD), Scanning Electron Microscopy (HR-SEM), Transmission Electron Microscopy (HR-TEM) and Fourier Transform Infrared (FT-IR) analyses revealed the M-type hexagonal structure of all samples. Vibrating sample magnetometer (VSM) analyses showed that all samples have strong ferromagnetic behavior at room temperature. The crystallite size varies in a range of 23.30–35.12 nm. Both HR-SEM and HR-TEM analyses confirmed the hexagonal morphology for products. A minimum of 40.49 and a maximum of 54.36 emu/g estimated specific saturation magnetization (σs) were observed for Ba0.5Cu0.5Fe12O19 and Ba0.9Cu0.1Fe12O19 NPs, respectively. The remnant magnetization (σr) has a minimum value of 21.27 emu/g belonging to Ba0.5Cu0.5Fe12O19 and has a maximum value of 28.15 emu/g belonging to Ba0.7Cu0.3Fe12O19 NPs. The coercive fields are between 1726 Oe and 2853 Oe. Keff (calculated effective anisotropy constants) is changing from 2.31 × 105 to 3.23 × 105 Ergs/g. It was observed that the strong magneto-crystalline anisotropy fields, (Ha) above 11.0 kOe for all samples which confirmed that all samples are hard magnet. Due to their small crystallite size (smaller than 50 nm) and high saturation magnetization, Ba1 − xCuxFe12O19 (0.0 ≤ x ≤ 0.5) nanoparticles can be employed as magnetic recording materials. © 2017, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract

Sodium lithium sulfide (NaLiS) nanocomposite have been successfully synthesized by using microwave-irradiation (MWI) method. The study suggested that the application of microwave heating is to produce homogeneous and fine NaLiS nanocomposite which were achieved by using the precursors of lithium acetate and thioacetamide in the presence of sodium alginate biopolymer. FTIR is used to identify the structural coordination and functional groups of the prepared nanocomposite. The structural property of NaLiS particles was investigated by XRD. The surface morphology and elemental composition of synthesized material was confirmed by SEM and EDX analyses. The optical property was studied by using UV–Vis spectrophotometer. Thermal stability of as prepared sample was studied by TGA/DTG analysis. Electrical transport studies of the prepared nanocomposite have been analyzed for various temperatures. NaLiS nanocomposite has ionic conductivity of ~ 10−7 S cm−1 at 35 °C which is six orders of magnitude higher than that of micro sized bulk Li2S (~ 10−13 S cm−1). © 2017, Springer Science+Business Media, LLC.

Assessment of combustion, performance and emission features of biodiesel in a thermal barrier coated diesel engine

(2018) *International Journal of Mechanical and Production Engineering Research and Development*, 8 (2), art. no. IJMPERDAPR201880, pp. 683-690.

DOI: 10.24247/ijmperdapr201880

Abstract
Thermal Barrier Coating technique was used to coat the piston crown with Alumina. The test was conducted in a single cylinder DI diesel engine. In common, the coating acts as a thermal barrier which improves the efficiency by dipping energy losses. In the first phase of the investigation, baseline reading of diesel was taken. The second part of the investigation, engine components was coated. And the third phase of investigation has carried the performance, combustion and emission of biodiesel in thermal barrier coated diesel engine. Thus the coating and testing were done successfully. As per our aim of improving the burning, performance and pollutant features of CI engine by Coating the Piston head with a Ceramic Coating of Alumina (Al2O3) Up to 250 microns have improved the burning characteristics like cylinder pressure and heat release rate considerably, As well as the performance characteristics like Brake Thermal Efficiency is enlarged up to 15.69 %, Mechanical Efficiency is increased up to 67.9% for TBC coated piston with Biodiesel when compared to others and Other Performance Characteristics were also increased. Notably, the Exhaust Emission like CO, Hydrocarbons ,and Oxygen were also reduced. Thus the project conducted by implementing the Thermal Barrier Coating in the Piston Head had given a good improvement in all burning, performance and pollutant features of the tested CI Engine. © TJPRC Pvt. Ltd.

Abstract
In this study, spinel magnesium cobalt ferrite (CoxMg1−xFe2O4: x = 0.0, 0.2, 0.4, 0.6, 0.8 and 1.0) nanocomposites were synthesized successfully by modified sol-gel combustion method. Magnesium nitrate, cobalt nitrate and iron nitrate were used as the source of divalent (Mg2+ and Co2+) and trivalent (Fe3+) cations, respectively and urea were used as the reducing (fuel) agent. The effects of cobalt ions on morphology, structural, optical, magnetic and photo-catalytic properties of spinel CoxMg1−xFe2O4 nanocomposites were investigated. Various characterization methods, including X-ray powder diffraction (XRD), high resolution scanning electron microscope (HR-SEM), transmission electron microscopy (HR-TEM), energy-dispersive X-ray spectroscopy (EDX), Fourier transforms infrared (FT-IR) spectroscopy, vibrating sample magnetometer (VSM) and photo-catalytic degradation (PCD) activity were used to study the phase purity, microstructure, particle size, elemental composition, functional group determination, band gap calculation, magnetic properties and degradation efficiency of nanoparticles, respectively. The observed results showed that the final products consists cubic spinel phase with sphere-like nanoparticles morphologies. Furthermore, spinel Co0.6Mg0.4Fe2O4 nanocomposite showed highest PCD efficiency (98.55%) than other composition of ferrite nanoparticles. © 2018 Elsevier B.V.

Abstract
Introduction and Aim: The pulse oxygen saturation is the percentage of HbO2 in the total Hb in the blood so called the O2 concentration in the blood. It is an important bio parameter for the respiration. Pulse Oximeter is a widely accepted method for noninvasive measurement of arterial oxygen saturation (SpO2) and pulse rate. The work describes the design of sensor for the purpose of measuring the SpO2 more easily. Materials and Methods: The reflectance type pulse Oximeter is designed using two wavelengths 660nm and 860nm with OPT101 as detector. The analysis is carried out by measuring the systolic amplitude (SA) for both the wavelength, SpO2 is measured mathematically by measuring the concentration of Hb and HbO2. Results: The results obtained by the proposed system are verified using pulse Oximeter instrument by CONTEC (CMS50E). For SpO2 measurement is done by placing the finger on the sensor and measurement are in the range of 70-100%. Conclusion: SpO2 and pulse rate can be measured non invasively by the proposed pulse Oximetry system. © 2018 Indian Association of Biomedical Scientists. All rights reserved.

Abstract
Introduction and Aim: Chronic obstructive pulmonary disease (COPD) is a lung disorder systemic illness with significant extra pulmonary feature such as exercise intolerance and muscle weakness. The aim was to assess the efficacy of a physical exercise training program in patients with mild to moderate COPD.The objective of this study was to evaluate the efficacy of a physical exercise training program in patients with mild to moderate COPD on exercise capacity, physical activity, dyspnoea and quality of life. Materials and Methods: Randomized control trail in 30 patients with mild to moderate airflow obstruction (FEV150-70% of predicted), dyspnoea and physically inactive life style were randomizedinto experimental and control group. The study was done for 7 weeks as a comparative study in which 35 to 50 years age patients were recruited and divided into two groups. Group A:[n=15] Breathing training, strengthening training, huffing and coughing technique , relaxation technique and advises on how to increase the level of physical activity given for 7 weeks and the subjects were treated for 5 sessions in a week .Time required: 5-10min, 3-4times daily.Group B: [n=15] usual care and advice on how to increase the level of physical activity given for 7 weeks and the subjects were treated for 2 sessions in a week. Results: On comparing Mean values of GROUP A and GROUP B on functional activity, it shows significant reduction in the post test but (GROUP A) shows (4.00) lower Mean values is more effective than (GROUP B) shows (3.09) at p<0.0001. Hence the null hypothesis is rejected and alternative hypothesis is accepted. Conclusion:The study concludes that physical training increases exercise capacity, physical activity, and quality of life reducing dyspnicattacks. © 2018 Indian Association of Biomedical Scientists. Abstract
In the current global scenario, recruitment policy outline needs a goal of an organization and explains how it can be achieved. The human recruitment policies vary from every organization based on their requirements. Most of the successful organization give an importance to each point right from the needs of staff, recruitment budget, how to find the new employees, ways to measure the results and to find the policy working conditions. The aim of this research is to study and find the right recruitment policies should be implemented in every business, manufacturing and health care organizations. © IAEME Publication.

Abstract
In modern global level scenario, the long term survival of any business entity is dictated by the well-organized supply and delivery methods that organization has employed. Supply chain management research provides various key factors for improving the performance of internal and external organisations. Single versus multiple respondent research design questions are raised on various management of different business organizations. In this research article the importance of supply chain management in small and medium enterprises research is described. Identification of supply chain management research can be performed with the differences of supply chain management process. Opportunities of supply chain management are explained clearly in supply chain management research. Supply chain management has been moved to local consideration and optimization factors to the consideration of the entire supply chain management. © IAEME Publication.

Abstract
In global working environment, employee satisfaction, employee engagement and job satisfaction are similar concepts as many uses these terms interchangeably. Employee satisfaction covers the basic concerns and needs of employees. Employee satisfaction or job satisfaction is the measure of the satisfaction level of employees in their jobs. Job satisfaction is usually measured using an employee survey. These surveys give importance to study in detail on topics such as management perception, compensation, workload, flexibility, team work and work atmosphere. To be a successful organization, it is very important that the human resource department show keen interest to know how happy and content individuals are at their work. In this article an attempt was made to study the significance of an employee and team satisfaction for augmentation and successfulness of an organization. Having an idea of their employee satisfaction level, helps companies to maintain and improve in every level thereby reducing the employee turnover. © IAEME Publication.

Evaluation of in vitro antidiabetic and antioxidant potential of Barleria cristata leaves extracts

(2018) *Asian Journal of Pharmaceutical and Clinical Research*, 11 (4), pp. 287-290. Cited 6 times.

Abstract
Objectives: The objectives of the study were to study the in vitro antidiabetic and antioxidant activity of Barleria cristata leaves extracts. Methods: Ethanol extract and petroleum ether extract of leaf and root of B. cristata were tested for their antidiabetic activity. The in vitro antidiabetic activity from α-amylase, α-glucosidase, and antioxidant activity was used to assess the potential activity of the fractions. Results: Our attempt results suggest that ethanol and the petroleum ether leaf extract from B. cristata show signs of dose-dependent increases to inhibitory activity on α-amylase, α-glucosidase enzymes, and antioxidant activity when compared with control. Ethanolic leaves to extract produced maximum in vitro antidiabetic effect and antioxidant activity when compared to petroleum ether extract. Conclusion: The ethanol leaf extract from B. cristata may be used in managing of blood glucose in a medical condition like diabetes. © 2018 The Authors.

Author Keywords
Antidiabetic activity; Antioxidant activity; Barleria cristata; Ethanol extract; In vitro study; Petroleum ether extract

Index Keywords
alpha glucosidase, amylase, antidiabetic agent, antioxidant, ascorbic acid, Barleria cristata extract, butylcresol, glucose, plant extract, unclassified drug; antidiabetic activity, antioxidant activity, Article, controlled study, dose response, drug screening, enzyme inhibition, glucose blood level, in vitro study, nonhuman, phytochemistry, plant leaf, plant root

Chemicals/CAS
alpha glucosidase, 9001-42-7; amylase, 9000-90-2, 9000-92-4, 9001-19-8; ascorbic acid, 134-03-2, 15421-15-5, 50-81-7; butylcresol, 128-37-0, 30587-81-6; glucose, 50-99-7, 84778-64-3

Abstract
Manganese ferrites nanoparticles (NPs) substituted with both Co2+ and Zn2+ simultaneously (CoyZnyMn1-2yFe2O4 NPs for y=0.0 to 0.5), have been produced by hydrothermal approach. The substitution with both Co2+ and Zn2+ ions on the structure, spectroscopic and magneto-optical properties of nanocrystalline MnFe2O4 spinel ferrites have been analyzed in detail. The formation of spinel phase and structural changes induced by Co2+ and Zn2+ ions substitutions were confirmed by X-ray diffraction studies. Rietveld refinement revealed the cubic spinel phase for all products (minor amount of Fe2O3). Lattice constant and crystallite size were found to decrease from 8.478 to 8.370 Å and from 14.68 to 8.22 nm, respectively with increasing substitution of Co2+ and Zn2+ ions. HR-SEM and HR-TEM micrographs revealed the high homogeneity cubic structure of samples. The hyperfine magnetic field values for all products after Mn2+, Zn2+ and Co2+ ions substitution were determined by Mössbauer analysis. The estimated optical Eg (Energy band gap) values are in the range of 1.41–1.54 eV for the samples. The smaller Eg values are mainly attributed to greater particle size and decreasing quantum confinement effect. © 2017 Elsevier Ltd and Techna Group S.r.l.

Abstract

Green synthetic route of silver nanoparticles (AgNPs) has already been proved to be an advantageous over other physico-chemical approaches due to its simplicity, cost effectiveness, ecofriendly and nontoxicity. In this finding, aqueous Wedelia chinensis leaf extract (WLE) mediated synthesis of AgNPs was approached. Surface plasmon resonance (SPR) band at 408 nm preliminary indicated the formation of AgNPs, while TEM and XRD characterization confirmed the formation of spherically shaped and crystalline AgNPs with an average size of 31.68 nm, respectively. The plausible biomolecules in the aqueous leaf extract responsible for the reduction and stabilization of AgNPs were identified by FTIR analysis and found to be polyphenolic groups in flavonoid. Further, synthesized AgNPs was explored for different biological applications. Biosynthesized AgNPs showed significant free radical scavenging activity as compared to Wedelia leaf extract and antibacterial activity against clinically isolated test pathogens where Gram-negative bacteria were found more susceptible to AgNPs than Gram-positive one. In addition, in vitro cytotoxic response was also evaluated on hepatocellular carcinoma Hep G2 cell lines and showed a dose-dependent cytotoxic response with an IC 50 value of 25 µg/mL. © 2017

Abstract
In this work, the morphological, thermal, and blood compatibility properties of prepared polyurethane (PU) and gandharvahasthadi eranda thailam (GHT) nanocomposites were investigated. Morphological and thermal characterization revealed reduced diameter, improved surface roughness, and higher thermal degradation compared to control. The activated partial thromboplastin time (APTT) and prothrombin time (PT) assay revealed that the fabricated nanocomposites displayed delayed blood clotting time owing to improved surface morphology. The hemolytic assay suggested that nanocomposites would be nonhemolytic material due to low hemolytic index of about 1.15% compared to pure PU (2.733%) portraying its safety with the red blood cells. Thus, the newly developed PU/GHT composite scaffold possessing better physicochemical and blood compatibility may be considered as a potential substitute scaffold for replacing damaged tissue. POLYM. Abstract

The different doping concentrations of lanthanum (La)-doped ZnO nanoparticles were synthesized successfully using zinc acetate and lanthanum nitrate via wet chemical method. Characterization of the prepared sample was done by standard analytical techniques such as powder x-ray diffraction analysis (P-XRD), high-resolution scanning electron microscopy (HR-SEM), energy-dispersive spectroscopy (EDS), Fourier transformer-infrared (FT-IR) spectroscopy, photoluminescence (PL) and UV-Vis spectroscopy (UV-Vis), and magnetic studies (VSM). The structural analysis has been carried out by powder x-ray diffraction. X-ray diffraction studies revealed that the nanoparticles are well-crystalline and possess hexagonal wurtzite structure. HR-SEM images showed the homogenous spherical-shaped morphology of the synthesized ZnO nanoparticles. EDS analysis confirmed the presence of La ions into ZnO lattice. The band gap (Eg) energy was determined by UV-Visible spectral data, and it was found that the Eg value decreases with increasing the La concentration into ZnO lattice. PL spectra confirmed that the effective La doping enhance the UV and visible region near band gap emission. The effect of La doping on the photocatalytic activity of ZnO nanoparticles for the degradation of methylene blue dye was studied under solar illumination and the results showed that the La doping kindles appreciable degradation of MB. The optical density measurements of the ZnO nanoparticles against both gram-positive (Bacillus subtilis, Staphylococcus aureus) as well as gram-negative bacteria (Proteus mirabilis, Salmonella typhi) showed better bacterial activity than pure ZnO. Moreover, it showed that higher dopant La in ZnO exhibit efficient antibacterial activity. © Springer Science+Business Media, LLC 2017.

Abstract

To develop biodegradable polymer scaffolds suitable for vascular tissue engineering applications, the bioengineering community has invested an extensive effort. The most common cause for the failure of vascular graft scaffolds is thrombosis. In this work, the scaffold based on polyurethane and virgin coconut oil was produced by electrospinning process for vascular tissue engineering applications with improved antithrombogenicity. The diameter of this electrospun polyurethane/virgin coconut oil composite was found to be reduced in the range of 886 ± 207 nm compared to pristine polyurethane which was in the range of 969 ± 217 nm. The Fourier transform infrared spectroscopy analysis revealed the interaction between polyurethane and virgin coconut oil as indicated by phase shifting of CH bond along with the formation of hydrogen bond. The contact angle measurement of fabricated composites was found to be increased owing to hydrophobic nature and also exhibited enhanced thermal stability as noted in thermogravimetric analysis. The atomic force microscopy analysis insinuated the increased surface roughness of the composite in comparison with the pure polyurethane. Developed scaffold resulted in delayed blood clotting as revealed by activated partial thromboplastin time and partial thromboplastin time assay. The hemolytic index of fabricated composites was found to be low indicating the enhanced safety of red blood cells. Hence, the newly developed nanofibrous composite scaffold could open the door for a suitable alternative for vascular graft applications. © 2017, © The Author(s) 2017.

Abstract
The room temperature ferromagnetism along with a rare orange emission in ZnO with equally concentrated Li, Na and K dopants is discussed here. In this report the alkali dopants Li, Na and K are co-doped in ZnO by solution combustion technique and annealed to two different temperatures 500 °C and 800 °C. The XRD analysis reveals the hexagonal wurtzite structure and the substitution of the alkali in ZnO. The SEM and EDAX study shows the morphology and impurity free samples of alkali doped ZnO. The photoluminescence data brings the profuse interstitial O atoms to light that involves in orange emission. The oxygen vacancies are also responsible for a weak green emission that decreases and then increases with alkali content. There is also a weak UV emission due to bound acceptor–donor recombination. The VSM shows the ferromagnetic behavior of the samples and thereby establishes that the alkali doped ZnO turns to be a member of the family of dilute magnetic semiconductors. © 2017, Springer Science+Business Media, LLC, part of Springer Nature.

Abstract
This work presents a control algorithm to achieve dynamic lateral balance in humanoid robots on unstable and geodynamic surfaces such as a seesaw or a suspension bridge. The proposed method generates a stable pose at any given point using the feedback from an Inertial Measurement Unit (IMU) in realtime which enables the robot to balance on dynamic surfaces. The algorithm provides a robust control of the Center of Gravity (CoG) of the robot and constricts the CoG from moving away from the most stable pose of the robot in the double support mode thus achieving stability at any given point in time. The method implemented is relatively less heavy in the terms of computation and easy to implement. The proposed system works on any humanoid platform irrespective of size and weight, given the robot has the required degrees of freedom needed to achieve balance. © 2017 IEEE.

Agaricus blazei extract attenuates rotenone-induced apoptosis through its mitochondrial protective and antioxidant properties in SH-SY5Y neuroblastoma cells

(2018) *Nutritional Neuroscience*, 21 (2), pp. 97-107. Cited 13 times.

Abstract
The present study was aimed to find out the effect of Agaricus blazei mushroom extract against rotenone-induced cellular model. SH-SY5Y neuroblastoma cells are divided into four experimental groups (control, rotenone (100 nM), A. blazei (5 µg/ml) + rotenone (100 nM), and A. blazei alone treated) based on MTT assay, cells were allowed to measure the ROS, TBARS levels, and antioxidants activities. Finally, mitochondrial transmembrane potential (MMP) and expressions of apoptotic proteins were also analyzed. Pre-treatment with A. blazei significantly enhanced cell viability, attenuated rotenone-induced ROS, MMP, and apoptosis. Our results indicated that anti-apoptotic properties of this natural compound due to its antioxidant and mitochondrial protective function protect rotenone-induced cytotoxicity. Therefore, it may be concluded that A. blazei can be further developed as a promising drug for the treatment of Parkinson's disease (PD). © 2016 Informa UK Limited, trading as Taylor & Francis Group.

Abstract
One of the significant issues confronting present-day filtration innovation is the savvy filtration of nitrate, NO3. The outline of a cost-effective, coordinated nitrogen expulsion framework including both nitrification and de-nitrification procedure is paramount to the proceeding with an improvement of business recycling aquaculture frameworks. Current nitrification framework is satisfactory and is commercial1y accessible; in any case, existing procedures for de-nitrification are only given water trade. The motivation behind this research is to deliver the primary business, autonomous de-nitrification channel, utilising surviving biotechnology (i.e., organic reactors and artificial intelligence). The objective of the review has been to plan a fuzzy rationale framework to control the operation of a de-nitrification bioreactor created by the College of Texas Medical Branch, Marine Biomedical Institute, for use in a shut recycling aquaculture framework. The improvement of a model structure was expert through a multi-disciplinary program including PC researchers, bioengineers, organic chemists and aquaculture. © 2018 EM International. Abstract
In an emerging global scenario, an effective and smooth supply chain is vital in operations, since thousands of organizations are serving millions of customers. For the organizations, having large product portfolios and serving millions of customers at various locations, getting the right product to the right customer at the right time is paramount. The supply chain ensures this flow from the supplier to the retailer and finally to the customer. Technology is a key role for these operations in general and the data in particular big data, i.e. vast quantities of data used in the supply chain helps, not only increasing the efficiency but also in forecasting the demand and understanding tastes and preferences of customers. Due to climate changes and global warming, customers and companies are increasingly looking at how their carbon footprint is impacting and how can data help achieve a sustainable and green supply chain. These are some of the issues that businesses need to grapple with to withstand relevant and successful. Hence, a study was made to analyze the usage of big data to enhance the environmental impact and green supply chain management. © TJPRC Pvt. Ltd.

Abstract
Improper selection of worker or supplier may lead an unpleasant impact on original equipment manufacturer. The greatest challenge for every industry is the acquisition of workers with talents and the strength of the supplier. In industries, the workers are expected to work with skill and technical knowledge based on the applications of the industry. There are different tools available for accurately monitoring and tracking the supply of conscription and connecting this with the performance, every industry can bring their maximum production rate on their production achievement. In this research, an attempt was made to study on the investigation of effective tools for conscription of workers for various industrial applications was carried out and necessary suggestions were made. © TJPRC Pvt. Ltd.

Abstract
In the current scenario, selection of right workers and suppliers in the manufacturing industry is an exigent activity. Selection of supplier and worker is the method of formatting the appropriate workers and suppliers to provide the right quality of products with right quantities, at the right price in the right time. Area of application describes to the premises in which the problem of worker and supplier selection was defined and relevant criteria, alternative and environment are considered. The objective of this research is to study the execution of selection processes in the regular area of industrial application with its current features for enhancement of manufacturing. The electronic selection process is under use in the internet technology to match the people for the right jobs and right suppliers. It is about advertising requirements on either in general sites or in concerned industry websites. At the very basic level it is particularly effective in getting a high level of response. While it may generate more than hundred applications and quotations than traditional print advertising, simply attracting more candidates and suppliers is only part of the work. The internet has become the major source of potential for material suppliers and job seeking candidates. Well known as online selection process or e-selection process, which reaches a large number of people and can get immediate feedback. This article also highlights the current features in the selection process of industrial area of applications. © TJPRC Pvt. Ltd.

Abstract
Internet of things is a new concept that shows the power of what connected devices can do in day to day lives. Millions of people in some way, shape or form are contributing towards an internet society and an internet economy by having and using devices that are connected to the internet and to each other. IoT has great potential to support society, to improve energy efficiency and to optimize various kinds of mobility and transport. On the other hand, IoT elevates the significant challenges to ensure through recognizing its probable merits. Issues regarding cyber security, theft and hacking of personal and financial data is the primary concern among a majority of public and organizations. A simple mobile phone can connect to other devices to sensors in public to regulate traffic and other civic institutions, the necessary data is merged with IoT and also the concern data analysis will engage in recreation as key role to continue in future. In this study the integration of IoT in various industrial applications were studied. © TJPRC Pvt. Ltd.

Abstract
Friction stir welding is a comparatively quiet new solid state metal joining process developed by the Welding Institute in 1991 and is used for joining of aluminum alloys and dissimilar materials which were difficult to using conventional welding. Objective of this work is to produce sound weld of dissimilar aluminum alloy of AA7075 and AA6101 by using FSW process with two different tool pin profile and investigate the mechanical and metallurgical properties such as tensile Strength, impact strength and microstructure in terms of Process parameters such as tool Rotational speed, tool transverse speed and axial force. Better mechanical properties were obtained at a tool rotational speed of 1200 rpm, transverse speed 45mm/min and axial force of 6KN. Better mechanical and metallurgical properties were obtained by the joint made by straight cylindrical tool pin profile. This study was focused on process parameters and suitable tool profile that necessary for fabricating superior welded joints. © TJPRC Pvt. Ltd.

Abstract
In the present work, an electrospun nanofibrous textile composed of polyurethane (PU), sodium bicarbonate (NaHCO 3) and pantothenic acid (PA) is developed for treating chronic wounds. Wounds are a common health problem and in particular, the chronic wounds such as vascular ulcers, diabetic ulcers and pressure ulcers cause a large number of morbidity and mortality. The main problems of the chronic wounds are prolonged inflammation phase and presence of acidic environment. These events deactivate the operation of growth factors and also the progression of natural healing mechanism. Hence, various types of advanced textile-based dressings are developed to address the clinical complications associated with chronic wound management. The prepared electrospun scaffolds were characterized to study their physicochemical and haemocompatible properties. The scanning electron microscopy micrographs depicted continuous, smooth-interconnected nanofibrous morphology of PU–NaHCO3–PA scaffolds. The Fourier transform infrared spectroscopy spectra indicated the addition of NaHCO3 and PA-based hydrophilic chemical groups, which significantly enhanced the wettability of the composites. Further, the PU–NaHCO3–PA composite membrane inferred to have a highly porous structure with the mean porosity of 79.4 ± 4.8%, which may provide a conducive environment for adherence and proliferation of skin cells. The composite scaffold also offers a highly haemocompatible surface by delaying coagulation of blood through contact activation pathways and by limiting red blood cells damage. Therefore, the excellent physicochemical properties, blood compatibility and the delivery of PA are anticipated to speed up the impaired healing process of chronic wounds. © 2018, Indian Academy of Sciences.

Abstract

Single layer aluminium oxide (Al2O3), zirconium oxide (ZrO2) and Al2O3/ZrO2 nano multilayer films were deposited on Si (100) substrates at room temperature by pulsed laser deposition. The development of Al2O3/ZrO2 nanolayered structure is an important method used to stabilize the high temperature phase (tetragonal and cubic) of ZrO2 at room temperature. In the Al2O3/ZrO2 multilayer structure, the Al2O3 layer was kept constant at 5 nm, while the ZrO2 layer thickness varied from 5 to 20 nm (5/5, 5/10, 5/15 and 5/20 nm) with a total of 40 bilayers. The X-ray diffraction studies of single layer Al2O3 indicated the γ-Al2O3 of cubic structure, while the single layer ZrO2 indicated both monoclinic and tetragonal phases. The 5/5 and 5/10 nm multilayer films showed the nanocrystalline nature of ZrO2 with tetragonal phase. The high resolution transmission electron microscopy studies indicated the formation of well-defined Al2O3 and ZrO2 layers and that they are of uniform thickness. The atomic force microscopy studies revealed the uniform and dense distribution of nanocrystallites. The nanoindentation studies indicated the hardness of 20.8 ± 1.10 and 10 ± 0.60 GPa, for single layer Al2O3 and ZrO2, respectively, and the hardness of multilayer films varied with bilayer thickness. © 2018, Springer-Verlag GmbH Germany, part of Springer Nature.

Abstract
The present work involves the synthesis of CuInS2/ZnS core/shell nanocrystals by hot injection method. Since CuInS2 itself is a strong luminescent material, we would like to study the influence of either the ZnS shell or Mn2+ ions dopant on CuInS2 core will enhance the luminescent property of the CuInS2 core. To find out the effect of ZnS shell and Mn2+ ions on CuInS2 core, we synthesized each of the above said nanocrystals separately and recorded their optical properties by UV–vis absorption and PL emission spectra. The band gap of the synthesized nanocrystals was confirmed by Cyclic Voltammetry. Further the influence of morphology and crystal structure of the shell and dopant on CuInS2 core was also be analyzed by recording their TEM and XRD studies. The elemental compositions of the synthesized nanocrystals were also analyzed by EDX analysis. The outcomes of the studies were agreed well with literature results. © 2017 Elsevier Ltd

A facile gold nanoparticle–based ELISA system for detection of osteopontin in saliva: Towards oral cancer diagnostics

(2018) *Clinica Chimica Acta*, 477, pp. 166-172. Cited 17 times.

Abstract
In the current study, we emphasize that osteopontin is overexpressed in oral squamous cell carcinoma. Overexpression of osteopontin levels was confirmed by mRNA quantification studies and immunohistochemistry analysis. Based on this, a gold nanoparticle–based ELISA system was developed for non-invasive osteopontin detection. The incorporation of AuNRs (Gold nanorods) or AuNSs (Gold nanospheres) in the conventional ELISA improved the sensitivity of analyses. A considerably lowered detection limit in case of AuNR (detection limit: 0.02 ng mL− 1) and AuNS (detection limit: 0.03 ng mL− 1) modified assay was obtained as compared to commercially available OPN ELISA kit (detection limit: 0.14 ng mL− 1). The modified ELISA had a wide linear detection range (0.31–20 ng mL− 1), good reproducibility, and specificity against the tested interferents in the saliva. Finally, the nanoELISA was validated with osteopontin spiked in artificial and normal saliva samples and observed to show good recovery (95.4–97.85%), which indicates the application potential of the developed kit for real sample analysis. © 2017 Elsevier B.V.

Abstract

Cardiovascular diseases (CVD) were estimated to claim 17 million lives each year. Among these, coronary heart disease almost accounts 50% deaths associated with CVD, which causes the blockage of the coronary arteries that supplies blood to the heart. Nowadays, the cardiac tissue engineering have become a promising solution to overcome the drawbacks associated with current therapies. Further, the scaffold used in cardiac tissue engineering must possess thromboresistant and anticoagulant nature to serve as a plausible candidate for cardiovascular applications. In this present investigation, a novel nanocomposite based on polyurethane (PU) and carotino oil was fabricated using electrospinning. Scanning electron microscopy images indicated that the nanocomposites have smaller fiber diameter (702±130 nm) compared to the pristine PU (969±217 nm). The Fourier transform infrared spectroscopy analysis confirmed the interaction between the carotino oil and PU by the formation of hydrogen bond and shifting of CH peak. The contact angle of electrospun PU/carotino oil was found to be 119°, which was increased compared to pristine PU (86°) indicating the hydrophobic nature of developed nanocomposites. Moreover, the surface roughness and thermal stability were found to be enhanced due to the presence of carotino oil in the PU matrix indicated in atomic force microscopy and thermogravimetric analysis. The enhanced surface roughness of nanocomposites resulted in delayed activation of the blood clot as revealed in activated partial thromboplastin time and prothrombin time assay. Moreover, the hemolytic index of fabricated nanocomposites was found to very low of about 1.33% compared to pristine PU (2.73%), suggesting non-hemolytic nature and also better blood compatibility. So, the developed PU/carotino nanocomposites having desirable characteristics like better physicochemical and blood compatibility may render appropriate potentials for raw materials of cardiac tissue engineering. © 2017 Wiley Periodicals, Inc.

Abstract
Electricity is a basic need for the daily life of everyone, and it serves as the main driver for the economic growth in any country. Coalfired Electricity generation forms the major share of energy resources in the world. In India, Coalfired electricity generation represents about 78% of the total power generation in the country. Coal reserve is fast depleting in the world. This situation has necessitated many countries in the world to opt for Distributed Generation (DG), using renewable sources of energy, to meet, the growing demand for electricity and to meet the depleting situation of Coal. In the past, some studies have been carried out by the Researchers using different types of DG systems. This study considers installation of PV systems, making use of the abundant availability of Solar Energy Resources. Appropriate sitting and sizing of DGs could lead to many positive effects for the distribution systems concerned. However, at the same time, inappropriate sitting and sizing of DGs could lead to many negative effects on the distribution systems concerned, such as the voltage profiles, beyond permissible limits and increased network losses. Therefore, it becomes necessary to allocate DGs at optimal locations with optimal sizing. This paper presents the results of the study carried out in a 400 V distribution system as well as in an 11-kV feeder in the Kanchipuram Distribution System in Tamil Nadu, India. This paper also presents the economic impact of the system with PVCs regarding Internal Rate of Return (IRR)for the investment made. © 2018 Authors.

Maximum accuracy in MANET-node-localization using multi-stage trackerwith less time-complexity
(2018) *International Journal of Engineering and Technology(UAE)*, 7 (3.34 Special Issue 34), pp. 110-113.

[a] Department of CSC, Bharath Institute of Higher Education and Research, Chennai, India
[b] Department of Computer Science and Engineering, GKM College of Engineering and Technology, Chennai, 600 063, India

Abstract
An ad hoc network (referred as MANET), is also called as mobile ad-hoc network and also wireless ad hoc network, is automatic self-configuring, infrastructure-less wireless network of mobile devices, and it widely used in various areas. Wireless sensor network composed of wireless sensor nodes and these nodes can do processing, sensing, computation and wireless communication. Because of its more functionality and low cost of energy consumption the wireless sensors are used widely in various areas such as ranging from sensors for environment, road safety, home, peer-to-peer messaging, vehicular ad hoc communications, health, disaster recovery operations, robots, weapons, defense, etc. The localization information is very important for the operation of MANET because of security, routing, and other needs. This articles mainly contracts with the network node station identification in wireless environment with maximum accuracy. There are many methods of localization exist for MANET, and this paper discusses, compares and explains the betterments through experimental localization methods. Localization process is a vital and essential part in lots of applications that signifies a supplementary procedure in a network function or sometime it can be a primary goal of the application. Localization, as an essential procedure is also desirable based on data mining and data fusion, efficient routing with the view of hierarchical data aggregation. The hierarchical aggregation method itself signifies beneficial function of all data networks as it decreases important energy consumption and saves bandwidth in ad hoc network. And also it makes sure of repeatability-of-tests through multiple test-environments which is a problematic task in many situations in wireless networks. Eventually the accuracy of the location identification is critical aspect of any algorithm and technique that will be the important aspect of this paper. © 2018 Authors.

A hybrid approach for test case prioritization using PSO based on software quality metrics
(2018) *International Journal of Engineering and Technology(UAE)*, 7 (3.12 Special Issue 12), pp. 300-303.

[a] Bharathiar University, Coimbatore, India
[b] Department of Information Technology, SRM Institute of Science and Technology, Chennai, India
[c] Department of MCA, Bharath University, Chennai, India

Abstract
Effective functionality checking of any software application is the crucial event that determines the quality of outcome obtained. Generally, checking scenarios that involves multiple test cases in mixture with multiple components is time consuming and also increases the quality assurance cost. Selection of suitable method/approach for optimization and prioritization of test cases as well as appropriate evaluation of the application would result in reduction of fault detection effort without appreciable information loss and further would also significantly decrease the clearing up cost. In the proposed method, test cases are optimized and then prioritized by Particle Swarm Optimization algorithm (PSO) and Improved Cuckoo Search algorithm (ICSA), respectively. Finally, the result will be evaluated for software quality measures. © 2018 Authors.

A color map for pseudo color processing of medical images

(2018) *International Journal of Engineering and Technology(UAE)*, 7 (3.34 Special Issue 34), pp. 954-958.

[a] Department of Computer Science and Engineering, Bharath Institute of Higher Education and Research, Chennai, India

Abstract
A color map is one which converts the colors of one image to the colors of another image. This paper says about a color map for pseudocoloring of medical image which converts gray scale medical images to color with the already existing color map. Converting a black and white image to color has no correct way or method, this method provides a direct way to choose, Red, Green and Blue (RGB) colors to individual components, but the color map conversion is done by converting the entire gray-scale image to color. By creating a color map then the color map is to be used to color the medical gray scale image. This method is applied for gray scale medical images such that the perception and quality of the image can be improved. © 2018 Authors.

Abstract
Gears are most powerful machine element to transmit the motion between rotating shaft. It acts as a dominating transmission system from many years ago. In this study, we analyzed a spur gear machine toolfor special application using theoretical method and Finite element analysis. Here, the bending stress on the spur gear is analyzed since these stresses induced play a vital role in gear life. The analysis presented the effect of gear material on induced bending stress. Finally results of theoretical method and Finite element analysis were determined and when compared gives a better results. © 2018 Authors.

Improved energy efficient Wireless Sensor Networks using balanced Multi-Hop routing protocol
(2018) *International Journal of Engineering and Technology(UAE)*, 7 (3), pp. 24-29.

DOI: 10.14419/ijet.v7i3.6.14927

Abstract
In this paper, consumption of energy by the sensor nodes in Wireless Sensor Nodes (WSNs) is been handled effectively using a combined technique. The objective of the paper is to increase the network lifetime with dynamic routing protocol. Here, the proposed routing algorithm, named Balanced Multi-Hop (BMH) protocol combines the multi-hop and direct transmission communication. This method further uses Dijkstra algorithm to route the packets between the sensor nodes and base station in mobile network. This method avoids the use of central router to control the other nodes. The results of the proposed method is tested against various result metrics. The evaluation over other existing methods prove that the BMH method achieves higher lifetime and high network throughput. © 2018 Authors.

Abstract
This paper deals with the effect of various combinations of temperature and pressure in the Superplastic forming process of AZ31B Magnesium alloy of different thickness into a hemispherical die. Using the time taken and the corresponding depth formed, the values of strain, strain rate and strain rate sensitivity were calculated. From these values, graphs were plotted. From the graphs, the effective pressure and temperature combination for specific thickness was determined. © 2018 Authors.

Abstract
The Machinability, and the process parameter optimization of Cryogenic CO2 machining operation for AISI D2 steel have been investigated based on the Taguchi based grey approach and Technique for Order Preference by Similarity to Ideal Solution (TOPSIS).In this examination work, the measure of the work materials utilized was AISI D2 Steel of size is 150mm × 50 mm × 50m with SANDWIK influence CVD To TiN coated carbide cutting insert tool device embed was utilized. The time taken for machining is 5 min and profundity of cut were kept up steady with various lower cutting velocities, and diverse encourage rate. An L27 orthogonal array was selected for planning the experiment. Cutting speed, depth of cut and feed rate were considered as input process parameters. Cutting force (Fz) and surface roughness (Ra) were considered as the performance measures. These performance measures were optimized for the improvement of machinability, quality of product. A comparison is made between the multi-criteria decision making tools. Grey Relational Analysis (GRA) and TOPSIS are used to confirm and prove the similarity. To determine the influence of process parameters, Analysis of Variance (ANOVA) is employed. The end results of experimental investigation proved that the machining performance can be enhanced effectively with the assistance of the proposed approaches. © 2018 Authors.

An effective method to denoiseeeg, ECG and PPG signals based on meyer wavelet transform

(2018) *International Journal of Engineering and Technology(UAE)*, 7 (3.34 Special Issue 34), pp. 678-683. Cited 3 times.

[a] ECE, Bharath Institute of Higher Education and Research, Chennai, India
[b] EIE, SASTRA Deemed University, Thanjavur, India

Abstract
In this analysis, the prevailing role of the wavelet transform in the interrogation of the ECG is discussed in detail, where both the constant and the discrete transform are considered in turn.A Wavelet denoising is functional on the original signal to eradicate high frequency noise, and then a process based on Meyer wavelet transform combined with adaptive filter is functional to eradicate the motion artifact. This approach uses Meyer Wavelet decomposition to extract the motion artifact, which is subsequently utilized as the reference input of an adaptive filter for noise cancellation. The technique diminishes the overhead of the circuit because it does not need a separate collection of reference input signal which link to noise. Testing results illustrate that this approach can efficiently remove motion artifact and make better the signal quality. © 2018 Authors.

Abstract
A Wireless Sensor Network is made up of small sensor nodes. These nodes are deployed in monitoring area. All nodes collect necessary data and route this data to centre server. A WSN should have self-organizing capability, as nodes positions are not determined in advance. Important factor in WSN is co-operation between nodes. Depending on WSN architecture and application, routing between nodes can vary. This paper presents a comparative study of different routing protocols/algorithm in WSN. Depending on network organization, WSN routing algorithms gets divided into 3 types, i.e. location based, hierarchical and flat. These routing algorithms can be divided further into sub types, depending on how an algorithm/protocol operates. This paper presents advantages and limitations of each routing algorithm. © 2018 Authors.

Mechanical testing of plastoceramic (nPMC sheet- SiC reinforced polyester nano composite)
(2018) *International Journal of Engineering and Technology(UAE)*, 7 (3.12 Special Issue 12), pp. 1195-1198.

[a] Department of Mechanical Engineering, Bharath Institute of Higher Education and Research, Chennai, India

Abstract
Concept of nano-composite Technology has gained greater momentum in its recent engineering applications. Recent works on Nano-composite technology have proved the viability of its use and its importance in modern engineering fields of applications particularly in the field of materials and manufacture. When dissimilar materials are used with different compositions to obtain newer nano- composite materials, it has lead to the production of novel products with unique properties. In the present study, the ceramic material SiC is used as reinforcement owing to its superior properties such as hardness, thermal conductivity and strength. And this has paved the way for using it in the making of polyester nano-composite sheet (nPMC) with aforementioned properties. Fabrication and characterization of Nano-composite sheet is carried out using a weight ratio of 30% so as to understand the molecular structure and mechanical behavior under external load. The synthetic procedure and characterization used in this study has made it possible to obtain SiC nano particles reinforced polyester nano-composites (nPMC) film with good thermal strength and chemical homogeneity over the traditional composite. © 2018 Authors.

Fuzzy based adaptive controller for on - Chip communication

(2018) *International Journal of Engineering and Technology(UAE)*, 7 (3.27 Special Issue 27), pp. 362-367.

[a] Department of ECE, BIHER, Chennai, India
[b] School of Electronics, VIT, Chennai Campus, India

Abstract
Occurrence of bit error is more when communication takes place in System on chip environment. By employing proper error detection and correction codes the bit error rate can be considerably reduced in On-chip communication. As System on chip involves heterogeneous system the efficiency of communication is improved when reconfigurable multiple coding schemes are preferred. Depending upon the requirements for various subsystem the correct code has to be selected. Due to the variations in input demands based on various subsystems the proper selection of codes become fuzzy in nature. In this paper Fuzzy Controller is designed to select the correct coding scheme. Inputs are given to the fuzzy controller based on the application demand of the user. The input parameters are minimum bit error rate, computational complexity and correlation level of the input data. Fuzzy Controller employs three membership functions and 27 rules to select the appropriate coding scheme. The selected coding scheme should be communicated at the proper time to the decoder. To enable the decoding process selected coding scheme is communicated effectively by using less overhead frame format. To verify the functionality of fuzzy controller random input data sets are used for testing. © 2018 Authors.

Abstract
The consistent increase in the number and ownership population of mobile devices introduces a variety of limitations. A set of this limi-tations revolve around interactivity. The overly dependent haptic mechanism of interaction has caused device falls, slower time to inter-action, health concerns, and limited support for the disabled among other problems. There is need to formulate innovative techniques that facilitate our interaction with these devices for users. In order to achieve this, a Real-time Voice Recognition Algorithm is formulated that lets users of mobile devices acquire freedom to move about and reduce the need for constantly glancing at their screen. This is achieved by allowing users to verbally command their devices to carry out ordinary tasks. An added unique feature is that it also offers offline access as any commands given by a user are processed and executed locally on the device. © 2018 C. Rukkumani et al.

Abstract
Wireless sensor network is noticed as bulk aggregation of slender sensor knobs that can characterize themselves in a decentralized system. Wireless communications assist these trades to increase plant knowledge by acquiring additional measurements from processes and apparatus when wired communication would be infeasible. The merits of the space diversity and transmit nature of wireless transmissions to adopt combined accession in which node transmit the host, that recover the lost host with long credibility by overhearing the transmission of its acquaintance. Article represents an indicating flexible unified management. On the basis of regular set code, the aspect of overall managed flexible WSN activity, local action conversion is protected. © 2018 Authors.

Abstract
Objective: The present study deals with the antioxidant study of one Ayurvedic medicine Aswagandhrishtam by three different methods, namely reducing power, 2,2-diphenyl-1-picrylhydrazyl (DPPH), and 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid (ABTS) assays. Methods: Aswagandharishtam, which is a liquid medicine, was taken as such at various concentrations for all the three assays. Results: The results show that Aswagandharistam has good antioxidant potential when compared with ascorbic acid as standard. The IC50 values of reducing power assay were 250.142, that of DPPH were 103.607, and of ABTS assay were 197.79 as compared with that of ascorbic acid being 19.59. Conclusion: All the three assays indicated that Aswagandharishtam showed very good antioxidant results. © 2018 The Authors.

Abstract
This chapter proposes to deliver a summary to the broad arena of manufacturing processes of composites for aerospace application by explaining the principle of how to produce composites, and presenting some of the current processes of manufacturing composites. This chapter also emphasizes problems faced during the manufacturing process. The main objectives in the aerospace industry are in terms of manufacturing cost and composite performance which can be accomplished with improvements in the composite manufacturing process. It is crucial to understand the parameters that could affect composite products. Composite manufacturing processes need to be cost-effective and able to produce composites with good quality. Manufacturing process technology has started to advance, which increases the quality of the composite. This chapter explains the basic principles of manufacturing process related to cost. © 2018 Elsevier Ltd. All rights reserved.

Connectivity analysis of brain signals during colour word reading interference
(2018) *Biomedicine (India)*, 38 (2), pp. 229-239. Cited 1 time.

Abstract
Introduction and Aim: Colour word interference task is a very commonly used paradigm in cognitive, clinical psychology. The task involves reading, selective attention, language processing and color word naming. During the task, various parts of the brain get stimulated. That creates electrical signals known as an electroencephalogram (EEG). A proper understanding of connectivity is various brain areas is a very important aspect of neuroscience. Statistical analysis of connectivity measures was carried out to study changes in phase and power based connectivity measures during the Stroop task in frontal and temporal brain region to understand the neuropsychological basis of cognitive activities in normal humans. Materials and Methods: The present study explored connectivity analysis of EEG. An analysis was carried out on real signals. Changes in magnitude square coherence and phase coherence were noted to be more prominent in frontal lobe during the cognitive tasks like color word reading interference. Results: Activity related changes were more prominent in gamma and theta frequency band. Stroop task is a reliable, low cost, efficient, effective, flexible and low maintenance clinical test for evaluating psychopathology and brain dysfunctions and can be used as a screen test for the diagnosis. Phase coupling drops for congruent activity; while it shows an increase during incongruent activity. Conclusion: Increased theta band power due to interference in the frontal lobe was observed during the study. Pearson product of theta band reported the significant difference in the coherence phase during congruent and incongruent activity. No prominent change in Pearson product of MS Coherence during congruent and incongruent was observed. © 2018 Indian Association of Biomedical Scientists. All rights reserved.

An efficient software verification using multi-layered software verification tool

(2018) *International Journal of Engineering and Technology(UAE)*, 7 (2.21 Special Issue 21), pp. 454-457. Cited 219 times.

Abstract
Rapid advancements in Software Verification and Validation have been critical in the wide development of tools and techniques to identify potential Concurrent bugs and hence verify the software correctness. A concurrent program has multiple processes and shared objects. Each process is a sequential program and they use the shared objects for communication for completion of a task. The primary objective of this survey is retrospective review of different tools and methods used for the verification of real-time concurrent software. This paper describes the proposed tool 'F-JAVA' for multithreaded Java codebases in contrast with existing 'FRAMA-C' platform, which is dedicated to real-time concurrent C software analysis. The proposed system is comprised of three layers, namely Programming rules generation stage, Verification stage with Particle Swarm Optimization (PSO) algorithm, and Performance measurement stage. It aims to address some of the challenges in the verification process such as larger programs, long execution times, and false alarms or bugs, and platform independent code verification. © 2018 Authors.

FEM method structural analysis of pressure hull by using hyper mesh

(2018) *International Journal of Engineering and Technology(UAE)*, 7 (1.5 Special Issue 5), pp. 258-263. Cited 4 times.

[a] Department of Mechanical Engineering, Bharath Institute of Higher Education And Research (BIHER), Chennai, India
[b] Department of Mechanical Engineering, Sriram College of Engineering, Chennai, India
[c] Department of Automobile Engineering, Bharath Institute of Higher Education And Research (BIHER), Chennai, India

Abstract
Pressure hulls are the central load bearing structures of naval submarines, and AUVs (autonomous underwater vehicles).. A pressure hull is a structure that is designed to resist the compressive forces related with hydrostatic pressure. The most coherent geometries for resisting these compressive forces are annular cross-sections, and thus, pressure hulls are typically composed of a combination of cones and ring-stiffened cylinders, with torispherical domes or spherical at either end. These shells are subject to an external pressure of 65 Bar due to the difference between outside and inside pressure.In the current paper, 3-D Modelling are carried out as per ASME codes to endure the pressure of 65 Bar. At length to thickness ratio of the pressure hull is very large, both 3D shell and 3D solid FEA models were developed and analyzed using Ansys Simulation. The 3D modeling of the assembly has used UNIGRAPHICS software and Finite element analysis is done using ANSYS-Hyper Mesh software. © 2018 Authors.

EMOPS: An enhanced multi-objective pswarm based classifier for poorly understood cancer patterns
(2018) *International Journal of Engineering and Technology(UAE)*, 7 (2 Special Issue 27), pp. 7-11. Cited 1 time.

[a] Department of Computer Science and Engineering, Bharath University, Chennai, Tamil Nadu, 600 073, India
[b] Department of Computer Applications, National Institute of Technology, Thiruchirappalli, Tamil Nadu, India
[c] Department of Computer Science and Engineering, Nehru College of Engineering and Research Centre, Thrissur, Tamil Nadu, India

Abstract
Microarray based Cancer Pattern Classification is one of the popular techniques in Bioinformatics Research. This Research Work is noticed that for studying the expression levels through the Gene Expression profiling experiments, thousands of Genes have to be simultaneously studied to understand the patterns of the Gene Expression or Cancer Pattern. This research work proposed an efficient Cancer Pattern Classifier called An Enhanced Multi-Objective Pswarm (EMOPS) and it is studied thoroughly in terms of Memory Utilization, Execution Time (Processing Time), Sensitivity, Specificity, Classification Accuracy and FScore. The results were compared with the recently proposed classifiers namely Hybrid Ant Bee Algorithm (HABA), Kernelized Fuzzy Rough Set Based Semi Supervised Support Vector Machine (KFRS-S3VM) and Multi-objective Particle Swarm Optimization (MPSO). For analyzing the performances of the proposed model, this work considered a few cancer patterns namely Bladder, Breast, Colon, Endometrial, Kidney, Leukemia, Lung, Melanoma, Mom-Hodgkin, Pancreatic, Prostate and Thyroid. From our experimental results, it was noticed that the proposed model outperforms the identified three classifiers in terms of Memory Utilization, Execution Time (Processing Time), Sensitivity, Specificity, Classification Accuracy and FScore. To improve the performance of the system further in term of Processing Time, the proposed model Enhanced Multi-Objective Pswarm (EMOPS) is implemented under Parallel Framework and evaluated. That is the model is tested with Two, Four, Eight and Sixteen Parallel Processors and from the results, it is established that the Processing Time decreases considerably which will improve the performance of the Proposed Model. © 2018 S. Abstract
Gene is not responsible for many Human Diseases and instead, diseases occur by different or group of genomes interacting together and cause diseases. Hence it is need to analyse and associate the complete genome sequences to understand or predict various possible human diseases. This research work focused i. Hierarchical-Random Forest based Clustering (HRF-Cluster), ii. Genetic Algorithm-Gene Association Classifier (GA-GA) and iii. Weighted Common Neighbor Classifier (wCN). These Classifiers were implemented and studied thoroughly in terms of Prediction Accuracy, Memory Utilization, Memory Usage and Processing Time. To improve the performances of the Gene Classifiers / Predictors further, this research work was proposed and implemented Gene Signature based HRF Cluster, G-HR. Results show that that the performances of the proposed Classifier G-HR is outperforming as compared with the identified three Classifiers in terms of Disease Pattern Prediction, Processing Time, Memory Usage and Classification Accuracy. To improve the performance of the system further in term of Processing Time, the proposed model G-HR is implemented under Parallel Framework and evaluated. That is the model is tested with Two, Four, Eight and Sixteen Parallel Processors and from the results, it is established that the Processing Time decreases considerably which will improve the performance of the Proposed Model. © 2018 N. An extended hyper geometric trust factor-based markov foresting scheme for mitigating selfish nodes in MANETs
(2018) *Journal of Advanced Research in Dynamical and Control Systems*, 10 (13), pp. 950-959.

[a] Bharath Institute of Higher Education and Research, Selaiyur, Chennai, Tamilnadu 73, India

Abstract
The trustworthiness of the cooperating mobile nodes in the ad hoc network is considered to be responsible for effective data dissemination. However, the selfish intent of node introduces the act of packet dropping in the network that introduces maximum degradation in the network performance. In this paper, an Extended Hyper Geometric Trust Factor-Based Markov Foresting Scheme (EHGTF-MFS) is proposed for effective prediction of future possibility in selfish behavior that could be mobile nodes in the network during data transmission. This proposed EHGTF-MFS derives the benefits of Hybrid Markov Chain and Enhanced Functional Link Network-based Grey Forecasting Model for preventing selfish node behavior in ad hoc networks. Markov chain is utilized in this proposed EHGTF-MFS approach for estimating the residual that is essential in modifying the forecasting value of enhancing the prediction accuracy. The simulation-based investigations of the proposed EHGTF-MFS determined to be superior in terms of 14 % enhancement in the packet delivery rate, 16% and 21% reduction in energy consumptions and packet delay compared to the baseline selfish detection approaches considered for analysis. © 2018, Institute of Advanced Scientific Research, Inc.. A skellam distribution inspired trust factor-based selfish node detection technique in MANETs
(2018) *Journal of Advanced Research in Dynamical and Control Systems*, 10 (13), pp. 940-949. Cited 39 times.

[a] Bharath Institute of Higher Education and Research, Selaiyur, Tamilnadu, India
[b] Kakatiya Institute of Technology & Science for Women, Nizamabad, Telangana, India

Abstract
The trust of mobile nodes in the ad hoc network is considered as the potential factor that need to be investigated for facilitating predominant network performance. This network performance influencing trust is degraded by the presence of intentionally behaving selfish nodes that does not forward data packets to their neighbourhood cooperative mobile nodes. These selfish nodes reduces the packet forward activity depending on its own energy level for conserving its energy in order to live active in the network. In this paper, a Skellam Distribution Inspired Trust Factor-based Selfish Node Detection Technique (SDITF-SNDT) is proposed for enforcing effective and efficient detection and isolation of selfishly behaving mobile nodes from the network. This proposed SDITF-SNDT initiates the process of selfish node detection by determining the mean packet deviation through which the standard deviation and variance is estimated for computing Skellam Distribution Inspired Trust Factor (SDITF). This SDITF computation aids in reliability estimation of nodes in order to categorize them into selfish and cooperative. The simulation experiments conducted for the proposed SDITF-SNDT approach confirmed excellence improvement in packet delivary rate and phenomenal minimizations in energy consumptions under increasing of mobile nodes in the network. © 2018, Institute of Advanced Scientific Research, Inc. Abstract
The scene of cloud computing has fundamentally changed in the course of the most recent decade. Not just have more suppliers and administration contributions swarmed the space, yet additionally cloud framework that was customarily restricted to single supplier server farms is presently advancing. In this paper, we right off the bat talk about the changing cloud foundation and consider the utilization of framework from different suppliers and the advantage of decentralizing computing far from server farms. These patterns have brought about the requirement for an assortment of new computing models that will be offered by future cloud foundation. These structures are foreseen to affect zones, for example, interfacing individuals and gadgets, information escalated computing, the administration space and self-learning frameworks. At long last, we spread out a guide of difficulties that should be tended to for understanding the capability of cutting edge cloud frameworks. © 2018, Institute of Advanced Scientific Research, Inc. Abstract
Modern microwave communication systems demand low cost, high performance multiband bandpass filters which characterize low insertion loss, high selectivity and out of band rejection together with optimized size reduction especially in wireless communication system applications such as wireless local area network and global system for mobile communications. In order to achieve the above requirements, a single filter propose to design a microstripbandpass filter using stepped impedance resonator. On the basis of Quad band stepped-impedance resonator, a novel quad-band bandpassfilter is presented, which has a quad-band feature of four passbands at desired frequencies and high out of band suppression. The new coupling scheme can improve the performance of the BPF of the input and output, and the stepped impedance resonator helps reduce the size. A microstrip filter was designed and simulated, and proved the feasibility of design concept in an excellent way with insertion loss of 1, 1.2,1.2 and 1.2 dB at 1.94,3.6, 5.2and 6.8GHz, respectively. © 2018, Institute of Advanced Scientific Research, Inc.. [c] Department of ECE, SSN College of Engineering, Chennai, India

Abstract
In this paper, narrowband tuning is achieved using PIN diodes. The circular patch antenna is fed by Coplanar Waveguide (CPW) feed. The circular patch is embedded inside a rectangular patch shaped slot. Two square slots of equal size are found on either side of the patch. The square slots can be either connected or disconnected to the rectangular slot by switching OFF or ON a pair of PIN diodes. The antenna can tune frequency in the range of 0.1 GHz between the WLAN frequencies 4.8 GHz, 4.9 GHz and 5 GHz. © 2018, Institute of Advanced Scientific Research, Inc. All rights reserved.

[c] Department of ECE, SSN College of Engineering, Chennai, India

Abstract
In this paper, wideband to sub-band frequency reconfiguration has been achieved in a simple and compact microstrip patch antenna. The antenna has a ground slot embedded with two PIN diodes. Based on the position and state of the PIN diodes in the ground slot, the resonance bandwidth of the antenna is varied. The antenna operates at a wideband of 4-12.4 GHz and can be reconfigured to operate in two sub-bands 4.2-7.2 GHz and 4-10.2 GHz. © 2018, Institute of Advanced Scientific Research, Inc. 37°C in 5% CO2 humidified atmosphere. IL2 was harvested from the culture supernants while the cell pellets were used to isolate RNAs. mRNAs were isolated from activated spleen cells and reverse transcripted. The first strand cDNA was applied to PCR and the amplified 700-800 bp DNAs (2 bands) were directly cloned into the expression vector. Preliminary screening with SDS-PAGE yielded a positive result. The poliferative response of IL2-dependent T cell line, assessed by 3H-TdR incorporation, was used as an assay system for IL2 activity. *Supported by National Natural Science Foundation of China

Review of high frequency resonant DC-DC power converters

(2018) *Journal of Advanced Research in Dynamical and Control Systems*, 10 (12), pp. 194-200.

[a] Bharath University, Chennai, Tamilnadu, India
[b] Vidya Academy of Science and Technology, Trivandrum, India

Abstract
The demand for high frequency power converters is rising due to the recent technological developments to achieve high efficiency and high power. Dc-dc power converters are used for power regulations and electrical isolation. The output voltage needs to be regulated using dc-dc converters in several applications for wide variations in the input voltage and the load. Electrical isolation is required in renewable energy applications to isolate source and the grid. Increasing the switching frequency reduces the size of the converter; however it also decreases the efficiency and impacts in the losses. This paper presents a review on high frequency high efficiency dc-dc power converters. © 2018, Institute of Advanced Scientific Research, Inc. All rights reserved.

[c] Department of Aerospace Engineering, Bharath University, Chennai, India

Abstract
An experimental analysis has been carried out to examine the mixing encouraging effectiveness of tabs with circular perforation of different perforation diameters, 1.5 mm, 2 mm and 2.5 mm. The geometrical blockage offered by the perforated tabs, placed diametrically opposite, at the nozzle exit, were 8.42%, 7.55% and 6.42%, respectively, for perforation diameters 1.5 mm, 2 mm and 2.5 mm. The Mach along the jet central axis and Mach profiles in the directions along and tangential to the tabs were calculated at various axial locations. The results of the Mach 0.4, 0.6 and 0.8 jets studied show that the tab with 2 mm perforation is a better mixing promoter than 1.5 mm and 2.5 mm perforations, effecting in a core length decrement of 62% for Mach 0.6 jet. The corresponding reduction in core length for 1.5 mm and 2.5 mm holes are only 47.61% and 42% respectively. © 2018 Taylor & Francis Group, London.

Abstract
Context: Thyroid swelling is a relatively common problem encountered in clinical practice throughout the world. Early detection of thyroid neoplasm is the fundamental basis of thyroid screening. A quest for ease, simple and accurate diagnostic tool that would differentiate between benign and malignant lesion has facilitated fine needle aspiration cytology (FNAC) as the first line tool in the initial thyroid evaluation. Aims: The study was aimed at classifying thyroid lesions according to the Bethesda System for Reporting Thyroid Cytopathology and to compare the diagnostic efficacy of fine needle aspiration cytology by correlating with gold standard histopathology. Settings and Design: This prospective cross-sectional study was conducted over a period of two years in a tertiary hospital, Kerala. Methods and Material: A total of 710 patients were included in the study. FNAC was performed and Staining was performed with Haematoxylin & Eosin (H & E), Papanicolaou and May-Grünwald Giemsa Stains. Diagnosis was made based on TBSRTC. Excision biopsies were fixed in 10% formalin. Statistical Analysis used: IBM Statistical Package for the Social Sciences Software version 21 was used to perform Pearson Chi-square test and Fischer Exact. Results: In this study 592 (83.4%) cases of non-neoplastic lesions, 111 (15.6%) cases of neoplastic lesions and seven cases were found unsatisfactory for diagnosis. FNAC showed high sensitivity and specificity in diagnosing neoplastic thyroid lesions and it showed high level of significance in diagnosing papillary thyroid carcinoma. Conclusions: FNAC is an excellent diagnostic tool in the management of thyroid lesions since it provides rapid diagnosis with high accuracy rate. © 2018, Red Flower Publication Pvt. Ltd.

Abstract
This research work explains the different mechanical effects of natural fiber composites to increase its strength and they were reinforced with different reinforcements. The matrix is considered as natural fiber matrix composites with coconut char; Jute and glass fiber composite materials were taken and give special properties for different applications in automobiles. Natural fiber composites have different advanced applications in current engineering materials. Hence the special properties like high strength, greater flexibility and abundantly available properties. With the help of different combination and proportions these materials were reinforced with different combinational materials were obtained for testing and selection of best combination material. The general properties for any material like mechanical properties of different reinforcements with different samples were tested and results were analyzed with the help of ANOVA and signal to noise ratio were found out by using MINITAB 18 Statistical software and results were compared. © 2018 J. Abstract
In this paper, the Intelligent Transport Systems (ITS) is used for improving the road safety on highways. It is sharing information about traffic conditions to other vehicles (Vehicle to Vehicle Communications). This methodologies improvement is now available in vehicular ad hoc networks (VANET). The packet success prospect is acquired first for link of vehicles by fetching multiple users' disturbance, rout loses. By considering the delay constraints and types of possibility crash, the optimized channel access probabilities are approximated. Finally the current methodologies customizing the channel access probabilities in Vehicular ad-hoc networks. The NS2 simulation output denote the reduction of traffic crash possibilities difference with same channel access probabilities in optimal range, thus it has vast advantages in other non-ideal systems.

Efficient fuzzy frequent pattern tree mining technique to predict chronic kidney diseases
(2018) *International Journal of Engineering and Technology(UAE)*, 7 (4), pp. 3103-3108.

[a] Department of Computer Applications, Bharath Institute of Higher Education and Research (BIHER), Declared as Deemed-to-be-University under Section 3 of UGC Act 1956, # 173 Agharam Road, Selaiyur, Chennai, Tamil Nadu, 600 073, India
[b] Department of Computer Science, Government Arts College for Men - (Autonomous), Nandanam, Chennai, Tamil Nadu, 600 035, India

Abstract
Data mining is an important role in huge number of applications, which are manufacturing, aerospace, business organizations, government sectors, and medical industry. In the medical field, the data mining is mostly used for detecting disease and diagnoses. The medical analysis is performed in patients to explore the disease are enormous which results in huge data collection. However, in the large number of records some important data are missing. In a dataset, the presence of missing data is a common problem in statistical analysis and it degrades the performance of the classifier model while using the dataset as a training sample. The Weighted Average Ensemble Learning Imputation (WAELI) was proposed for filling the missing values in the clinical dataset by using single value imputation and multiple value imputation models. Furthermore, the priority-assigning algorithm was assigned along with WAELI to each feature (WAELI-FPA) for selecting the high priority features. In this paper, the performance of WAELI-FPA is further improved by modifying the classifier model such as mining fuzzy frequent pattern tree (MFFPT) and orthogonal partial least square (O-PLS) to achieve the optimal result. Initially, the O-PLS is efficiently performed in the reduction of missing valued after that allocating the priority to each feature in the clinical database. Second, the MFFPT is performed which is initially determined the frequent data and assigning fuzzy membership values then utilizing priority mechanism to predict the kidney disease. The performance of proposed model is tested in terms of accuracy, precision, recall and F-Measure. © 2018 S. Dilli Arasu, Dr. R. Thirumalaiselvi.

Abstract
Background: Thyroid hormones play an important role in the homeostasis of calcium and phosphorous levels. A person with thyroid dysfunction may exhibit symptoms that are owing to the alteration in calcium levels. Aim: To find out the calcium alteration in hypothyroidism with different age groups in Kanchipuram district. Methodology: In this study 40 patients with the age group of 20-60 y were taken. The parameters like TSH and Ca2+ were estimated with commercially available kits. Results: In our study out of 40 patients 18 patients with hypothyroidism had hypocalcemia, which constitute 45% (n=18) of the study had less serum calcium. Remaining 55% patients having normal calcium levels, In future it may develop hypocalcaemia. Discussion and conclusion: Total calcium levels in serum were found to be significantly lower in hypothyroid patients in all age groups. This study concluded that, in Kanchipuram district patients have low levels of serum calcium in hypothyroidism. S.Ca++ in hypothyroid people demonstrates a constructive connection between the S.Ca++ and serum TSH. These fluctuations of serum calcium ought to be considered in treating the patients with hypothyroidism by therapeutic experts. © 2018, Scientific Publishers of India. All rights reserved.

Abstract
A solid state welding, like friction stir welding (FSW) is commonly suitable for joining dissimilar aluminium plates. A non-consumable revolving tool was used to induce heat and plastic distortion between abutting surfaces of the plates. This paper, presented the influence of tool revolving speed, axial force and weld transverse speed on tensile and impact strength properties were evaluated for the joint by using destructive test. The FSW has been done at tool revolving speed of 1000, 1100, 1200 rpm, weld speed of 30, 45, 60 mm/min and tool plunge force of 3, 4, 5 kN on dissimilar aluminium alloy AA7075 and AA6063 by two different tool profiles of Triangle and square. Better mixing of both aluminium alloy joints was achieved at lower welding transverse speed of 30 mm/min with high tool revolving speed of 1200 rpm. Also it is found that the use of the triangular profile of the tool gives better mechanical properties. The growth in mechanical properties is attributed to the maturation of fine grain and intermetallic compound in the weld region. Copyright © 2018 Inderscience Enterprises Ltd.

Abstract
The installation of DG in the distribution system is challenging for the technical, economic and environmental aspects. The smaller scale generation technologies are developed for minimum cost and today's competition. The range capacities from a few kilowatts to 100MW. The optimal siting and sizing of DG in the distribution system improve the reduces the losses, improves the voltage and improve the economics of the system. However, to find the optimal solution for multi-objective problems, the different optimization methods are studied. This paper study the impact of DG onthe distribution system, Distributed generation, a different approach for optimal siting and sizing impact on utilities and the customers. © 2018, Advanced Scientific Research. Abstract
The Cancer Pattern Classification and Prediction Technique through Microarray is the one of the demanding research techniques in the research field of Bioinformatics. A lot of Multi-Objective based methods and Multi-Objective Optimization Methods have been developed recently to identify and predict Cancer Patterns. At the same time, for predicting and classifying cancer patterns, hundreds of thousands of Genes Expressions Pattern needed to study to recognize those Gene Expression patterns or Cancer Patterns. As Gene Patterns are complex, we need to employ an efficient Multi Objective Particle Swarm Optimization (MOPSO) Technique to predict Cancer pattern population effectively and efficiently. Recently an Enhanced Multi-Objective Pswarm (EMOPS) was developed by the authors and its classification accuracy was improved. However, we revealed through this work that the current Classifier EMOPS fails to update entire population during each and every iteration to predict the gene pattern (cancer pattern) and it is depending on Global Best Particles that is the major issue which needed to focus for improving the classification accuracy by considering Optimization quality and convergence speed as well. To address this issue, we developed a Smart Multi-Objective Particle Swarm Optimizer (SMOPSO), where Particles are updated based on Pairwise Competitions instead of updating Global best particles. This model is simulated and analyzed thoroughly. The simulated work helps this research work to establish that the developed SMOPSO outperforms the EMOPS classifiers with regard to Convergence and Diversity on bi-objective ZDT 1 and ZDT 3, Execution Time (Processing Time), and Classification Accuracy. © International Research Publication House.

G-HWRF: Gene signature based hierarchical weighted random forest clustering technique for high dimensional human disease data sets

(2018) *International Journal of Engineering Research and Technology*, 11 (4), pp. 637-648.

[a] Bharath University, Chennai, Tamil Nadu 600 073, India
[b] Department of Computer Applications, National Institute of Technology, Tiruchirappalli, Tamil Nadu, India
[c] Department of Computer Science and Engineering, Nehru College of Engineering and Research Centre, Pampady, Kerala 680 588, India

Abstract
Many Human Diseases are not taking place or occurring due to Gene only and instead diseases have occurred due to interact with various genomes together and this is causing diseases. Hence it is needed for analysing the entire genome sequences thoroughly for understanding the interactions that will help us for predicting various patterns of human diseases. A few Gene Signature based Clustering Techniques namely i. Hierarchical-Random Forest based Clustering (HRF-Cluster), ii. Genetic Algorithm-Gene Association Classifier (GA-GA) and iii. Weighted Common Neighbor Classifier (wCN) have been proposed recently by Researchers to predict the gene patterns of Diseases. This research work previously developed a Gene Signature based Hierarchical-Random Forest Cluster(G-HRF Cluster) and achieved better performance compared to the above mentioned Classifiers. However, from the experimental study, it is observed that G-HRF Cluster unable to maximize Classification Accuracy when very High Dimensional Data Sets used and analysed for Diseases Pattern Prediction. To address this issue, this paper proposed an efficient model called Gene Signature based Hierarchical Weighted Random Forest Clustering Technique (G-HWRF). That is the proposed model will construct weighted matrix from Hierarchical Weighted Random Forest, which will minimize Misclassification Rate. This Model was simulated and carefully studied. This research work revealed from its experimental results that the proposed Clustering Technique G-HWRF is performing well compared to that of our previous work G-HRF Cluster with regard to Accuracy Disease Pattern Classification/Prediction Memory Usage Processing Time. © International Research Publication House.

Abstract
Background & Objective: Acute Myeloid Leukemia (AML) is characterized by the accumulation of ≥20% myeloid premature blast cells in the bone marrow and they are most often found in the peripheral blood. AML is generally classified based on either French-American-British (FAB) or World Health Organization (WHO) systems. For better clinical management, cytogenetic finding in AML is necessary and in patients with normal karyotypes-molecular, epigenetic and proteomic biomarkers are very important in choosing which drugs to prescribe. Mutations of certain genes like NPM1, FLT3, CEBPA, RUNX1 and MLL play a crucial role in the risk management and clinical stratification of AML patients. We reviewed the literature for the current trends of clinical practice based on laboratory based diagnostic tests in AML. Outcome and Result: We listed in AML chromosomal aberrations (translocations, fusions or RUNX1, CBFB, MYHI1, MLL, EVI1, PML-RARA), genes and mutations (NPM1, FLT3, CEPBA, MLL) epigenetic factors (DNMT34, TET2) and proteomic biomarkers (PTP, PTK, PIP) and analysed how on the basis of these factors medical risk was stratified and accordingly managed. Conclusion: AML is genetically and functionally a heterogenous malignant disease. In the western world, leukemia is one of the most common among all cancers. India is ranked 3rd in cancer disease after United States of America and China. Cytogenetic analysis, molecular/proteomic biomarkers and epigenetic factors assist in determining the management strategies and prognosis of the disease. A number of targeted drugs in pre-clinical and clinical trials based on molecular factors and epigenetic mechanisms have been reported to have promising results in AML patients. © 2018 Bentham Science Publishers.

Abstract
In modern scenario, government and other agencies are using Wireless Sensor Networks (WSN) in different sectors like defense, society, roads, forest, railway etc. Due to existing node failure, energy consumption problems in WSN, its very complicated to deploy denser node network which is the current age requirement. Sensor nodes usually work on battery-powered source with manual intervention and it is a very tedious and time consuming task in forest and defense areas. Hence, it becomes a necessity to reduce energy consumption of sensor, it will also increase energy lifetime. Many algorithms like Radio Aware (RA), Distance Source Routing (DSR) and directed Diffusion (DD) could not solve problems like network connectivity & asymmetric links. To overcome this problem Optimized Mobile Radio Aware (OMRA) technique is demonstrated in this paper. OFDM (Orthogonal Frequency Division Multiplexing) is wireless communication system which is used for node to node communication in WSN. Hybrid system is proposed here by adding PAPR reduction algorithm for improving BER efficiency. © IAEME Publication.

Abstract
The problem of high dimensional clustering and classification has been well studied in previous articles. Also, the recommendation generation towards the treatment based on input symptoms has been considered in this research part. Number of approaches has been discussed earlier in literature towards disease prediction and recommendation generation. Still, the efficient of such recommendation systems are not up to noticeable rate. To improve the performance, an efficient multi level symptom similarity based disease prediction and recommendation generation has been presented. The method reads the input data set, performs preprocessing to remove the noisy records. In the second stage, the method performs Class Level Feature Similarity Clustering. The classification of input symptom set has been performed using MLSS (Multi Level Symptom Similarity) measure estimated between different class of samples. According to the selected class, the method selects higher frequent medicine set as recommendation using drug success rate and frequency measures. The proposed method improves the performance of clustering, disease prediction with higher efficient medicine recommendation. © 2018 Authors.

Abstract
In modern scenario it has become inherent to employ of Wireless Sensor Networks (WSN) for government and other sectors including defense. Sensor networks can be employ in society, industries, military areas, roads, forests, etc. In a traditional networks it becomes complicated to employ denser node deployment and other problems, e.g., node failure, energy consumption and asymmetric are also prominent. Sensor nodes usually works on battery-powered source and these nodes do not operate for longer timewithout anymanual intervention and it is a very tedious and time-consuming task in forest and defense areas. Hence, it becomes a necessity to reduce energy consumption of sensor, it will also increase energy lifetime. Traditional algorithms like Radio Aware (RA), Distance Source Routing (DSR) and Directed Diffusion (DD) do not solve problems like network connectivity and asymmetric links. To overcome this problem Optimized Mobile Radio Aware (OMRA) technique is demonstrated in this paper. © Springer Nature Singapore Pte Ltd. 2019.

Abstract
The micro-power-consumption technique requires high power density DC/ DC converters and power supply sources. The voltage lift technique is a popular application in electronic circuit design. The power converter performs DC-DC step-up voltage conversion with high efficiency, high power density and cheap topology in a simple structure. The objective of this work is to develop PI controller for Elementary circuit of P/O and N/O push-pull switched capacitor Luo converters to ensure constant load voltage under supply and load disturbances using MATLAB/MULTISIM software. The simulation results are presented and evaluated. © 2018, Institute of Advanced Scientific Research, Inc.. All rights reserved.

Implementation of 7-level symmetric multilevel inverter using minimum switches with PI-controller
(2018) *Journal of Advanced Research in Dynamical and Control Systems*, 10 (10 Special Issue), pp. 879-886.

Abstract
This paper presents an implementation of 7-level symmetric Multilevel Inverter (MLI) using minimum switches with PI-controller for Renewable Energy Source (RES) based applications. MLIs available in the literature have more features inturn more switches. The system with more switches would not opt for wide range applications. To rectify the problems in existing systems a 7-level MLI with reduced number of switches using carrier based PWM techniques proposed in this paper. The performance parameter, Total Harmonic Distortion (THD) is analyzed with reduced Switching loss, size and cost. The system is developed using MATLAB-SIMULINK and shows the effectiveness of the proposed strategies. © 2018, Institute of Advanced Scientific Research, Inc.. All rights reserved.

The economic benefit analysis to the consumer and utility due to PV generation connected to the radial distribution system

(2018) *International Journal of Engineering and Technology(UAE)*, 7 (4), pp. 2314-2318. Cited 1 time.

DOI: 10.14419/ijet.v7i4.12584

Abstract
During the recent past, the interest towards adoption of Distributed Generation (DG) has increased dramatically among the electric power system utilities. It has been well established that installation of PV Generation at the load points in a distribution system is excellent advantages for both consumers and the utilities. The question arises whether the maximum beneficiary is the Utility or the consumer and who has to bear the cost. This research analyses the economics of the DG with PV Systems, taking a typical 400V distribution system. A detailed procedure adopted for performing the economic analysis is presented in this paper. Benefits considered includes Saving in the energy losses, Energy substitute by the PV system, Capacity release in the Feeders and the Transformer. The PV system is installed at the selected consumer load points, based on the size and location of the loads. Discounted Cash Flow technique is used to assess the economics of the system, by computing the Internal Rate of Return. The paper presents the advantages of using PV Generating systems in the Power Distribution System, quantifying economic benefits both for the Utilities and for the Customers with supporting data. © 2018 G. Lincy et.al.

Abstract
DC-DC power conversion used in industry and various applications where the demand for compact power supplies grows significantly. Conventional DC-DC converters have relatively poor voltage regulation. However, the resonant DC-DC converters have numerous advantages for DC-DC power conversions with various combinations like LCC, LCL, and LCLC, etc. This paper focuses on selecting the best topology by considering based on the performance. Based on the analysis a fourth order Resonant Power Converter (LCLC) topology is selected, and the steady state stability of the converter is analysed using state space approach. To improve the performance of the proposed DC-DC resonant converter closed loop control is implemented using PI and fuzzy controller, performance parameters like efficiency, settling time, rise time, and steady-state error is estimated by simulation software in MATLAB/Simulink. © 2018, Institute of Advanced Scientific Research, Inc. Abstract
Wireless device networks (WSNs) were envisioned to wind up the fabric of our condition and society. Be that as it may, they cannot beat a few operational troubles, for illustration, the constrained framework time outline, which chokes their summed up availability. To broaden the time of the WSN, the more prominent portion of the otherworldly gathering plans are orchestrated towards the non-enhanced WSN. This article shows the subject enhanced developed distributed energy-efficient clustering (EDDEEC) for heterogeneous WSN. EDDEEC comprises basically of 3 portions, that is, heterogeneous framework appear energy consumption model, and Clustering-based on routing mechanism. Our heterogeneous framework show depends on 3 centers imperativeness levels. Or maybe than most works, our imperativeness show considers the impact of the radio's environment. At long final, EDDEEC's expected gathering component changes the probability of choosing a bunch header in a money related and energetic way Simulation results validate and ensure the performance domination of EDDEEC compared to existing schemes in terms of varied metrics like network life. © 2018, Institute of Advanced Scientific Research, Inc. Abstract
Introduction: In our earlier studies, we reported that rotenone-induced mitochondrial dysfunction, oxidative stress, and apoptosis in the brain of mice have been protected through treatment with Agaricus blazei (A. blazei) extract. The present study is focused on the efficacy of A. blazei in the mitigation of motor and nonmotor symptoms induced by rotenone. Materials and Methods: Mice were randomly divided into four groups and treated with rotenone and simultaneously with A. blazei. Results: Rotenone treatment altered both the motor and nonmotor behavioral deficits as compared to controls. Concurrent treatment with rotenone and A. blazei significantly restored these behavioral deficits. Conclusion: The results of the present study strengthen the fact that the nutritional supplement of A. blazei extract in rotenone-affected areas might offer the neuroprotection. © 2018 International Journal of Nutrition, Pharmacology, Neurological Diseases | Published by Wolters Kluwer - Medknow.

Abstract
Objective: This observational study was conducted during the year 2016–2017 to assess the electrodiagnostic evidence of peripheral nerve dysfunction among newly diagnosed hypothyroid patients attending a tertiary care hospital and to find the effect of hormonal treatment after short duration. Methods: An observational study was conducted in 25 newly diagnosed hypothyroid patients with the age group of 20–60 were included. After obtaining informed consent, all participants were examined with electrodiagnostic workup performed at the initial time of diagnosis and after short duration for median and ulnar nerves of upper limb by (NeuroStim-NS2, EMG/EP/NCV, and MEDICAID SYSTEMS). Electrophysiological parameters such as distal motor latency, amplitude, and conduction velocity were evaluated. Results: The mean age of study population was 42.7±12.1 (23–61) years. The mean values of nerve conduction velocity of motor and sensory median before the treatment were 42.8±15.7 and 40.13±4.19 and motor and sensory ulnar before treatment were 41.18±22.4 and 39.46±11.9. The mean values of nerve conduction velocity of motor and sensory median after treatment were 53.35±4.7 and 57.3±5.6 and motor and sensory ulnar After treatment were 54.56±2.99 and 54.09±12.17. The result of the study. Shows that there were reduction of conduction velocity before treatment and statistically significant after 3 months duration of treatment with appropriate doses. Conclusion: After treatment, total triiodothyronine, total thyroxin, free triiodothyronine, free thyroxin, thyroid-stimulating hormone, and median and ulnar nerve motor and sensory functions were normal with appropriate treatment. The involvement of sensory fibers is more than that of the motor fibers. © 2018 The Authors. Published by Innovare Academic Sciences Pvt Ltd.

Abstract
Functional Magnetic Resonance Imaging (fMRI) is a non-invasive method for investigating the structure and function of the brain. Using fMRI, brain functions and areas responsible for the particular activities are investigated. The objective of the image processing methods using fMRI is to investigate the functional connectivity. To localize mental functions of specific brain regions and to identify the brain regions, those are activated simultaneously. Correlation and cross-coherence of the time series of the pixels are used for the detection of functional connectivity in fMRI images for the different motor movements (upper and lower limb movement and finger tapping action). The methodology was applied to three groups (six subjects) consisting aged between 10 and 75 years: (1) Normal and healthy subject performing finger tapping actions, (2) brain tumour patient performing lower limb movement (LL), and (3) brain tumour patient performing upper limb movements (UL). The threshold applied for the cross-correlation is 5000. Similarly, the threshold applied for cross-coherence and power parameters is in the range of (0.6–0.9). The algorithm implemented is found to be non-destructive, and there is no loss of temporal or spatial data. The result shows that for the normal subject, functionally connected pixels are more as compared to the brain tumour patients. © 2018, Springer Nature Singapore Pte Ltd.

Abstract
Every day risk of cardiovascular diseases is increasing in young adults. Now researchers are working on study related to a single bio-signal for prediction of maximum physiological parameters. One of such a bio-signal is photoplethysmogram (PPG). Non-invasive measurement of blood volume change is carried out by using PPG. PPG captured from a cranial site is known as cranial photoplethysmogram (CPPG). Most of the time various bio-signals acquired from the brain are used to study only the brain-related disorders. Near-infrared spectroscopy-based sensor used to record CPPG from frontal region can be used to predict heart rate, oxygen saturation, blood pressure, cardiac output and respiration rate. This paper explains the design specifications of sensor used and study of various time and amplitude indices of differentiated CPPG signal. Authors have studied two levels of differentiation of CPPG obtained by applying MATLAB-based algorithm. Features obtained from differentiated CPPG signal are compared with the standard available values to check the feasibility of this brain signal in the prediction of vascular health. The study was carried out on 19 healthy subjects aged between 19 and 30 years. Our results showed that the optical brain signal used to study hemodynamic changes in brain can also be used for the prediction of vascular health. © 2018, Springer Nature Singapore Pte Ltd.

Abstract
Various maxillofacial prosthetic materials have been instrumental in the rehabilitation of maxillofacial defects created by disease or trauma. This is the second part of a two-part article reviewing materials used for fabrication of the maxillofacial prosthesis. While the first part dealt with classification, properties, ideal requirements, and also reviewed in detail some of the materials, this article discusses the widely used silicone elastomers as a maxillofacial prosthetic material. © 2018, JPR Solutions.

Abstract
Social networks such as Twitter, Face book, Linked In etc are one of the major sources of information generator which is accepted by wide spectrum of user worldwide undoubtedly. Twitter is an social networking service where user interact and post messages known as tweets. The twitter messages are now restricted to 280 characters very recently. Understanding the characteristic of the content paved a way to number of research challenges in the spectrum of personalized recommendation system, topic detection, sentiment analysis etc. To address the problem of using standard topic Model for tweet environment, the strategy of aggregating the tweets to form a pseudo document came into existent. In this work, amongst the various other aggregating strategies of tweets, pooling the tweets by Hash tags are considered because they outperform considerably when compared to the baseline state of art methods. Mainly the tweets are pooled to avoid data sparsity problem. The goal of this work is to apply the standard LDA and ATM technique on the pooled data and to compare the metric obtained to differentiate the performance of the model. The various model metrics that are needed to evaluate the models are precision, Recall, F-measure, Perplexity, PMI, purity etc. The metrics that are measured are precision, Recall, F-measure, Perplexity, PMI, Running time. The results clearly states that running time for hashtag-LDA are minimal when compared to hashtag-ATM. The values for precision, Recall, F-measure for hashtag-LDA are high when measured for hashtag-ATM. Perplexity measure obtained for hashtag-LDA are higher which clearly states that the model works very well when compared with hashtag-ATM and un pooled tweets. © 2018, Institute of Advanced Scientific Research, Inc. Abstract
On the rise exponentially, machine learning is adopted by various organizations across various domains to crunch petabytes of data to deliver more meaningful conclusions and predictions. With machine learning, it's become quite possible to transform a wide variety of industries, in this complicated world. A category of machine learning algorithms called as classifiers, have found wide spread use in processing the large datasets efficiently. Classifiers are applied to big datasets through supervised learning methods. Though there exists huge number of classifier algorithms, it is important to apply some intelligence in careful selection of algorithms, to deliver excellent business intelligence. In order to select a more suitable classifier algorithm for a problem, it is important to analyze the performance of classifiers based on certain parameters and different datasets. In this paper, we analyzed variety of classifiers from the perspective of performance measures such as Precision, Recall, Mean Absolute Error, and Root Mean Square Error pertaining to two different datasets using WEKA. Also, in the conclusion we present the findings from analysis of performance of classifiers. © 2017 Institute of Advanced Scientific Research, Inc. All rights reserved.

Abstract
Introduction and Aim: Recently About 2.2 million diarrheal deaths per year especially in developing countries, in which 1.4 million deaths among children under age five. Safe drinking water, especially in developing countries, is still a major problem. The present study was designed to explore the antibacterial effect of copper vessel stored with drinking water inoculated with diarrhea-causing bacterial strains enterotoxigenic Escherichia coli (ETEC), Vibrio cholera and Shigella flexneri. Materials and Methods: The bacterial strains isolated from fecal sample, identified by colony morphology and biochemical test. About 500 Colony Forming Unit (CFU/mL) of the bacterial strains of E. coli, V. cholera and S. flexneri were inoculated separately in drinking water stored in the copper vessel and non- copper vessel for 12 hrs. After incubation 100 µL of samples was taken from each copper vessel and non-copper vessel container and spread on nutrient agar for the enumeration of bacteria colonies. After 24hrs of incubation at 37°C, dishes were observed for visible bacterial colonies using colony counter. Results: The bacterial strains E. coli (ETEC) (532 CFU), V. cholera (502 CFU) and S. flexneri (512 CFU) was inoculated in copper vessel observed no growth on the selective media and when the bacterial strains inoculated in the non-copper vessel observed growth upon inoculated in selective media E. coli (ETEC) (624 CFU), V. cholera (328 CFU) and S. flexneri (483 CFU). Conclusion: The antibacterial activity may be due to the oligodynamic effect of copper which destroy the cell wall and cell membrane results in membrane damage. The present study recommends the use of cost-effective copper vessels to store drinking water especially in rural areas for protection from water-borne infection. © 2018 Indian Association of Biomedical Scientists. Abstract
Magnetic resonance imaging (MRI), due to its optimal delineation of anatomy, has become the mainstay in imaging for diagnosing Müllerian duct anomalies (MDA). Pelvic MRI is requested for various conditions such as primary amenorrhoea, infertility or poor obstetric history with regard to MDA, as identifying the exact aetiology for these conditions is vital. Knowledge regarding the classification of MDA is important, as the treatment varies with respect to the different classes. As all the lesions do not fit within the classification of the American Society for Reproductive Medicine, a new anatomy-based classification was established by the European Society of Human Reproduction and Embryology and the European Society for Gynecological Endoscopy, to fulfil the needs of experts. We aim to discuss various classes of classified and unclassified MDA with regard to both the above-mentioned classifications and illustrate some of them using various cases based on pelvic MRI studies. © 2018. Abstract
Solar energy power generation has several advantages such as low maintenance costs; environment friendly, no rotating parts in con-struc-tion gives no noise. In recent years, solar power is used to charge the batteries of electric vehicles and instead of internal combus-tion En-gines the Electric motors such as DC motors, Brushless DC (BLDC) motors are used for driving the vehicles. The Multiple Lift Push-Pull Luo (MLPPL) converter is a DC-DC converter, which combines both switched capacitor and voltage lift techniques. Further, the MLPPL converters can be used in high power density, high power efficiency and voltage transfer gain applications. In this work, a MLPPL convert-er integrated with voltage source inverter (VSI) loading BLDC motor drive for automotive applications have been pro-posed. Further, the simulation of the proposed design has been carried out using MATLAB/Simulink Software. The torque of the BLDC motor has been varied and the performance of the MLPPL converter has been analyzed. Results demonstrate that the proposed design is capable to operate over a wide range of torque, which fulfills the application of Electric Vehicle. © 2018 S. Srinivasan, Dr. T. S. Sivakumaran.

Abstract
Metal cutting is the real assembling operation today in perspective of the financial hugeness. A major learning of the metal slicing process is basic to discover ideal conditions and grow new cutting gear. Explanatory and numerical models can be derived from this basic information to foresee factors of enthusiasm for expanding process proficiency and part quality. The present work gives a procedure to decide the stream worry at high distortion rates and temperatures that are experienced in the cutting conditions by utilizing Finite Element models with a specific end goal to recreate metal cutting procedures. FEM based models are exceptionally basic in foreseeing chip development, figuring powers, dispersions of strain, strain rate, temperature, and weight on cutting zone. Johnson Cook's model gave consistent incentive for every single material and stream stretch condition by utilizing SHPB test. By an option test, for example, Orthogonal test, tractable test and influence utilization of Oxley's investigation to stream stretch figured physically contrasted and JC's stream stress and examination got fluctuated directly, thus demonstrated that by an other test stream stress will be ascertained. © 2018, Institute of Advanced Scientific Research, Inc. Infra-red thermography based inspection of hybrid composite laminates under flexure loading
(2018) *International Journal of Vehicle Structures and Systems*, 10 (1), pp. 6-9. Cited 1 time.

DOI: 10.4273/ijvss.10.1.02

Abstract
Generally, the aircraft structural parts are economically high in cost so the materials need to be inspected for defects or damages using various non-destructive testing (NDT) methods like ultrasonic, thermography and acoustic emission. The aim of this project is to characterize the defects in composite laminates before and after the flexural loading using infra-red thermography NDT method. GFRP and hybrid (GFRP+CFRP) composite laminates are fabricated with different orientation such as uni-directional, cross ply, anti-symmetric and angle ply and then tested under flexural loading according to ASTM D790 standard. The volume fraction of the fibre and matrix needs to be found out to know the void content and the mixing ratio of reinforcement and binder. © 2018. MechAero Foundation for Technical Research & Education Excellence.

Performance of circular to non circular shape scramjet isolators
(2018) *International Journal of Vehicle Structures and Systems*, 10 (1), pp. 14-17.

DOI: 10.4273/ijvss.10.1.04

[b] Dept. of Aeronautical Engg., Tagore Engg. College, Chennai, India

Abstract
This paper details the influence of geometry variation such as shape transition of the isolator from its entry to exit on overall performance of scramjet isolators. The experiments are conducted to assess the performance of two isolator geometries of circle to pentagon and circle to hexagon. The pseudo shock length is obtained for the two cases by observing the sudden pressure rise in pressure plots taken along the wall. It is found that the shock train length is shorter for circular to pentagon duct compared with the other duct. Hence, this duct is preferable in order to prevent inlet non-start induced by the pressure rise in the combustion chamber. © 2018. MechAero Foundation for Technical Research & Education Excellence.

Flow characteristics over a missile at higher angle of attacks using experiments and simulation
(2018) *International Journal of Vehicle Structures and Systems*, 10 (1), pp. 10-13. Cited 1 time.

DOI: 10.4273/ijvss.10.1.03

[a] Tagore Engg. College, Chennai, Tamilnadu, India
[b] Bharath Institute of Higher Education and Research, Chennai, Tamilnadu, India

Abstract
The need to determine forces and moments acting on bodies of revolution at high angles of attack originally arose in connection with airships. In general missile aerodynamics is dominated with vertical and separated flows. The advent of highly manoeuvrable missile design concepts has required a major effort in understanding the problem of slender bodies of revolution at high angles of attack. An extensive experimental investigation was conducted to determine the aerodynamic forces and moments. The aerodynamic data are needed to establish the structural and control system requirements. Tests were conducted on a smooth missile model with several interchangeable nose parts in a wind tunnel at subsonic level at high angle of attack. The yaw moments and side forces are determined using force measuring systems by which maximum induced side force was found. Using oil flow visualization technique, vortex shedding location and vortex strength were traced at various angles of attack. Computational analysis was carried out for the cone, elliptical and ogive nose shapes. It is then compared with the experimental results to know where the least flow separation occurs and proper reasons for the side forces. © 2018. MechAero Foundation for Technical Research & Education Excellence.

Firefly optimization security enhancement using optimal key encrypted exchange in steganography
(2018) *Journal of Advanced Research in Dynamical and Control Systems*, 10, pp. 281-290.

[a] Bharath University, Selaiyur, Chennai, India
[b] Department of CSE, VelTech MultiTech Dr.RR Dr.SR Engineering College, Avadi, Chennai, India

Abstract
Steganography is the art and science of secretly embedding the data inside a statistics source without converting its perceptual quality which can be executed to prevent unauthorized access to computers, large databases, online facts and additionally protects the data from corruption. To increase the ability of the concealed secret information and to provide an imperceptible stego-image and increase the security of the secret image a new irreversible steganography scheme has been proposed. The aim of this paper is to hide a secret image in the cover image that can improve both the visual quality and the security of the stego-image while still providing a large embedding capacity. This is achieved by a Firefly Optimization scheme incorporates Noise Visibility Function (NVF) and a hyper chaos DNA based encryption scheme. NVF analyzes the local image properties to identify the complex areas where more secret bits should be embedded. © 2017, Institute of Advanced Scientific Research, Inc. All rights reserved.

Abstract
In global trade, supply chain management is the management of flow of goods and services, involves the movement and storage of raw materials, of work-in-process inventory and of finished goods from point of origin to point of consumption. In current global level, the long term survival of any business entity is dictated by the efficient supply and delivery processes that unit has implemented. To succeed in a dynamic demand and supply environment, Indian industrial organizations need to ensure that proper coordination is in place between their suppliers and their customers until the last of the supply chain demands are satisfied without delay. This necessitates the need for tracking the inventory on hand augmented by a solid order and supply chain management. This is very crucial to cost control, availability to supply on demand, maintain market control and eventual profitability. In this article the major functions of supply chain management in Indian industrial sectors were studied and analysed. © IAEME Publication.

Abstract
Regression testing is a testing to test the modified software during the maintenance level. Regression testing is a costly but crucial problem in software development. Both the research community and the industry have paid much attention to this problem. The paper try to do the survey of and current practice in industry and also try to find out whether there are gaps between them. The observations show that although some issues are concerned both by the research community and the industry. This research discusses the problems about current research on regression testing and quality control in application of regression testing in the engineering practice, and proposes a practical regression method, combing with change-impact-analysis, business rules model, cost risk assessment and test case management. This paper presents an approach to prioritize regression test cases based on the factors such as rate of fault deduction, percentage of fault detected and the risk detection capability. The proposed approach is compared with previous approach using APFD metric. The results represent that propose approach outperforms the earlier approach. © 2018, Institute of Advanced Scientific Research, Inc. All rights reserved.

Abstract
Diffusion bonding process was adopted to bond the two dissimilar metals of aluminium coated AZ 80 magnesium alloy and AA 7075 aluminium alloy for different set of process parameters. The samples of AZ 80 magnesium alloy and AA 7075 aluminium alloy without interlayer were attempted with three trials of five different temperatures ranging from 325°C to 450°C were taken in the present investigation. The other parameters such as bonding pressure of 10 MPa and bonding time of 15 min were kept constant. The mechanical properties of the samples showed improved mechanical properties at optimum temperature and that the surface properties were probed using optical micrsocopy and scanning electron microscope (SEM). The bonding quality with the effect of temperature on diffusion bonded specimen was investigated in detail. © 2017 Elsevier Ltd.

Abstract
In our present swift life the times are changing. In day to day activities women are contributing their life equally like men for the society. In any industries we use to observe that women are also playing a key role from the management level to the worker level starting from security, house-keeping to chief executive officer and managing director of an organization. When compared with men, women are facing lots of challenges and they have to handle multiple things unlike men. They take equal responsibilities at home as well at office and they have to balance both. When they are concentrating on both they use to get physical and mental strain and fatigue which causes to ill health. When it comes to physical strain then they can manage very well. But when it comes to emotional or mental strain they will be fed-up and needs some support from others. The objective of this research is to study the stress and emotional crisis of working women and necessary suggestions to control their physical health. © 2018, Indian Journal of Public Health Research and Development. Study on effectiveness of internal and external training to the development of employee in corporate sectors and hospitals

(2018) *Indian Journal of Public Health Research and Development*, 9 (3), pp. 259-264.

DOI: 10.5958/0976-5506.2018.00219.X

Abstract
In the present corporate scenario, the investment which is vested in training programs is very high. The corporate organizations and hospitals are intending to expand the skill set of the employee thus it helps in the organizational growth. Initially, the training was given from the organization employees who are experts in that particular field. But in early 2000s, the involvement of external training programs started booming and it is now gaining better prominence in the corporate market. The employees are also getting involved in those sessions. This study will give a brief comparison of both internal and external training programs for the employee growth in corporate business sectors and hospitals with necessary suggestions. © 2018, Indian Journal of Public Health Research and Development. Abstract
Microarray based cancer pattern classification is one of the popular techniques in bioinformatics research. At the same time, it was noticed that for studying the expression levels through the gene expression profiling experiments, thousands of genes have to be simultaneously studied to understand the patterns of the gene expression or cancer pattern. This research proposed an efficient cancer pattern classifier called an Enhanced Multi-Objective Particle Swarm (EMOPS) and it is studied thoroughly in terms of memory utilization, execution time (processing time), sensitivity, specificity, classification accuracy and F-score. The results were compared with that of the recently proposed classifiers namely Hybrid Ant Bee Algorithm (HABA), Kernelized Fuzzy Rough Set based semi supervised Support Vector Machine (KFRS-S3VM) and Multi-objective Particle Swarm Optimization (MPSO). For analyzing the performances of the proposed model, this research considered a few cancer patterns namely bladder, breast, colon, endometrial, kidney, leukemia, lung, melanoma, mom-hodgkin, pancreatic, prostate and thyroid. From our experimental results, it was noticed that the proposed model outperforms the identified three classifiers in terms of memory utilization, execution time (processing time), sensitivity, specificity, classification accuracy and F-score. © Medwell Journals, 2018.

Dynamic MRI and isotope renogram in the functional evaluation of pelviureteric junction obstruction: A comparative study [Üreteropelvik bileşke obstrüksiyonunun fonksiyonel değerlendirmesinde dinamik MRG ve izotop renogramı: Bir karşılaştırmalı çalışma]

(2018) *Turkish Journal of Urology*, 44 (1), pp. 45-50. Cited 4 times.

DOI: 10.5152/tud.2018.08365

Abstract
Objective: The aim of this study was to evaluate and compare the diagnostic accuracy of dynamic contrast- enhanced magnetic resonance imaging (dMRI) and isotope renogram in the functional evaluation of pelviureteric junction obstruction (PUJO). Material and methods: Forty-two patients included in the study were investigated with isotope renogram and subsequently, subjected to dMRI. Time-activity curves were generated for both isotope renogram and dMRI. Out of the 42 cases, 9 cases were conservatively managed. Thirty-three cases were taken up for surgical intervention. Results: Of 33 patients taken up for surgical intervention, 12 underwent laparoscopic nephrectomy and 21 of them pyeloplasty. The mean glomerular filtration rates (GFRs) as measured by isotope renogram and dMRI were 22.5+4.2 mL/min and 23.8+3.1 mL/min respectively. The calculation of GFR by isotope renogram, showed good correlation with that of dMRI with correlation coefficient of 0.93. The dMRI was able to reveal the functional status of the renal unit accurately. dMRI did not yield false positive results with 20 of 21 patients scheduled for pyeloplasty and 11 of 12 patients scheduled for nephrectomy. Isotope renogram had a false positive result in 3 cases compared with surgical diagnosis. Conclusion: Analysis of renal function using dMRI yielded results comparable to those of renal scintigraphy, with superior spatial and contrast resolution. It was also better in prompting management decisions with respect to the obstructed systems. dMRI can be used as a “one stop imaging examination” that can replace different imaging methods used for morphological, etiological and functional evaluation of PUJO. © 2018 by Turkish Association of Urology.

Abstract

Aim: To assess the smoking habits, oral hygiene practices, and self-perceived malodor among arts and science college students in Manimangalam, Chennai. Materials and Methods: An epidemiological survey with closed-ended questionnaire was carried out in an Arts and Science College in Manimangalam, Chennai, to assess smoking habits, oral hygiene practices, and self-perceived malodor. All the 1200 students were invited to participate in the study, but only 650 volunteers participated and a self-administered close-ended questionnaire was distributed. Descriptive statistics were used to describe the data. Results: Of 650 students, only 31 (4.8%) had a habit of smoking and 456 (70.1%) were aware of the ill effects of smoking. Among the subjects who participated in the study, 464 (71.3 %) brushed once daily, 457 (70.3%) rinsed their mouth after eating. Self-perceived malodor was expressed by 59 (9%) students and it has interfered with their social life. Conclusion: The habit of smoking was seen in a very small percentage of study participants, and majority of them were aware of its ill effects. There is a need to educate them on brushing techniques and encourage them to visit a physician/dentist whenever they perceive a malodor. © 2018 Journal of International Oral Health | Published by Wolters Kluwer - Medknow.

Abstract
Background: Parkinson's disease (PD) is a progressive neurodegenerative disorder (NDD) associated with the loss of dopaminergic neurons in the substantia nigra and subsequently has an effect on motor function and coordination. The pathology of PD is multifactorial, in which neuroinflammation and oxidative damage are the two of the main protagonists. Objectives: The present study aims to assess the potential antioxidant and anti-inflammatory effects of demethoxycurcumin (DMC), a natural derivative of curcumin, against rotenone-induced PD in rats. Materials and Methods: Rats were randomized and divided into six groups: Control, rotenone (0.5 mg/kg/day, intraperitoneal in sunflower oil) treated for 7 days, rotenone and DMC (5, 10, and 20 mg/kg b.w) cotreated, and DMC (20 mg/kg b.w) alone treated groups. Results: Based on the dopamine concentration and biochemical estimations, the effective dose of DMC was selected and the chronic study was performed. At the end of the experimental period, behavioral studies and protein expression patterns of inflammatory markers were analyzed. Rotenone treatment led to motor dysfunctions, neurochemical deficits, and oxidative stress and enhanced expressions of inflammatory markers, whereas oral administration of DMC attenuated all the above. Conclusion: Even though further research is needed to prove its efficacy in clinical trial, the results of our study showed that DMC may offer a promising and new therapeutic lead for the treatment of NDDs including PD. © 2018 Pharmacognosy Magazine | Published by Wolters Kluwer-Medknow.

Abstract
Hadoop is the main open source tool which backs the acknowledgment of the Big data upheaval and depends on Googles MapReduce spearheading mission in the area of very much substantial measure of information stocking space and handling. As of late, functions and advancements tending to "Big Data" confrontations have turned out to be colossally critical in numerous ranges of business and logical registering. The Map-Reduce model has empowered an expansive arrangement of uses, has prodded the improvement of open-source programming advances such as Hadoop, and is making a whirlwind of enthusiasm for the scholarly in addition to researchers from industry around enhancements and optional ways to deal with taking care of the requests of breaking down extensive complex information sets. The HPC people group is constantly vigilant for approaches to influence more extensive product speculations to distinguish mass-market advances which could be viably connected to take care of issues particular to high-performance computing.For example there are a few cases where outing of the rush of mass-business sector innovations has fundamentally affected HPC. Utilizing bigger business sector advances and the related economy-of-scale is being a compelling method for lessening prices and drawing in a bigger group. HPC, much competent devices, and regularly expanding reenactment scales are creating information at a pace that surpasses our capacity to viably oversee, break down, and distribute it. Execution of MapReduce pattern gives a method for extensive information volumes that could be consistently handled through utilization of vast item PCs. Hadoop and MapReduce have generally been utilized for web information handling and just as of late been utilized for exploratory applications. Our recommended framework comprehends the effect of document framework, programming modes on execution and system. Acquirement of an application's execution is to a great extent work load subordinate. Configuration of each MapReduce frameworks needs to incorporate the Key components such as, precise output, Quick Response and High speed. Enhancement of the Fault resilience of Map Reduce Implementation Adapted for High Performance Computing Environments in Distributed and Parallel Computing is considered to be the primary objective of this work. © 2017 Elsevier Ltd.

Mechanical behaviour of dissimilar aluminum materials joints using FSW with various tool profile
(2018) *ARPN Journal of Engineering and Applied Sciences*, 13 (2), pp. 660-669.

[a] Bharath Institute of science and Technology, Bharath University, Chennai, India

[c] Department of Automobile Engineering, Bharath University, Chennai, India

Abstract
In modern structural concept demand reduction of both weight as well cost of production and fabrication of materials. Aluminum alloys has gathered wide acceptance in the fabrication of light weight structures requiring a high strength to weight ratio. Friction stir welding is at present widely used for the welding aluminum alloys. In this work defect free joints of AA6063-T6 and AA7075-T651 alloy plates of 6.35mm of thickness were butt jointed using friction stir welding. The quality of the joints are influenced by process parameters such as tool rotational speed, axial force and feed rate. The effect of these parameters on tensile strength, impact strength and microhardness of the joints were discussed. The results showed that the tool rotational speed has significant influence of tensile strength. Welding speed and tool profile dominated the impact strength. Microhardness value were found at the in around of the weld zone. © 2006-2018 Asian Research Publishing Network (ARPN).

Denoising of EEG, ECG and PPG signals using wavelet transform
(2018) *Journal of Pharmaceutical Sciences and Research*, 10 (1), pp. 156-161. Cited 7 times.

[a] ECE, Bharath Institute of Higher Education and Research, Chennai, India
[b] EIE, SASTRA Deemed University, Thanjavur, India

Abstract
Physiological signals such as EEG, ECG and PPG are very sensitive in nature and they are invariably corrupted by Power line and environmental noises. Quite often the frequencies of the signal and the noise overlap. Because of the importance of the underlying signal it is imperative to eliminate the noise without altering the time domain representation of the signals. Hence normal frequency selective filtering alone is not suffice for processing these signals. A wavelet based filtering approach is ideal for this problem as wavelet transforms preserve both time resolution and frequency resolution of the input signal. In this manuscript a Multi-scale wavelet based noise removal algorithm is proposed for processing EEG, ECG and PPG signals. And it is shown that the algorithm not only removes the noise effectively but also keeps the time resolution of the input signal intact. The improvement in noise removal is verified by comparing the signal to noise ratio of signal before and after applying wavelet based filtering algorithm. © 2018, Pharmainfo Publications. Abstract
The pelvic or the innominate bone is the one of the most reliable sex indicator of the skeletal remains during a medicolegal investigation followed by cranium and long bones. The present study was conducted 9 pelvis articulated with known sex and 30 unknown hip bones were selected for the present study. 9 pelvis articulated with known sex was studied using manual vernier calipers to investigate the sexual dimorphism of well established acetabulum – pubis index. In an articulated male pelvis, the A-P index was derived from the measurement of the distance between the anterior rim of acetabulum and pubic symphysis (XY) and the total width of the acetabulum (YZ). In an articulated female pelvis, the A-P index was derived from the measurement of the distance between the anterior rim of acetabulum and pubic symphysis (XY) and the total width of the acetabulum (YZ). Then the same measurement was carried in the individual hip bone of unknown sex. The data collected were tabulated and evaluated as shown in table 1 and table 2. The outcome measures of 9 pelvis showed that XY=YZ in male and XY>YZ in female. Using this scale, out of 30 individuals 22 were male and 8 were female. This study concluded that acetabulum-pubic index could be used for determination of sex. © 2018, Indian Journal of Forensic Medicine and Toxicology. All rights reserved.

Estimation of lung functions and risk of developing obstructive sleep apnoea in wind instrument players
(2018) *Indian Journal of Physiology and Pharmacology*, 62 (1), pp. 59-65. Cited 3 times.

Abstract
Introduction: Decreased incidence of snoring and obstructive sleep apnoea in wind instrument players has been shown by a few studies, probably due to an increased tone of respiratory muscles. Hence their lung functions were evaluated and their risk of developing Obstructive sleep apnoea was assessed. Methodology: Test subjects (n=64) belonged to high resistance wind instrument category and controls (n=65) included subjects who did not play any form of wind instrument. Based on Berlin questionnaire subjects were divided into high or low risk. Lung functions were evaluated and statistical analysis was done using student t test and chi square test. Results: There was no difference in MVV values (P=0.63) between the tests and controls. More number of test group subjects belonged to the low risk group as compared to the controls (P=0.000*) according to the Berlin scores. Pearson's correlation showed no association between MVV and Berlin score (r=0.062, P=0.63). Conclusion: There is no association between improved lung functions and reduced risk of developing OSA although OSA risk is reduced in wind instrument players. Hence wind instrument playing may be considered as an option to reduce the risk or treat obstruction in sleep apnoea. © 2018, Association of Physiologists and Pharmacologists of India. Abstract
Objective: This study was aimed to inhibit the 1, 3 β-glucan synthase with azadirachtin or with the derivatives by docking method. Methods: The homology model of the protein 1, 3 β glucan synthase was prepared with “easy modellar” using query sequence and template and it was validated with procheck of Ramachandran plot. The ligand was selected from the PubChem database, and the. sdf file was downloaded which was converted to another file format with open babel. The. pdb files of protein and ligand were uploaded for rough docking with iGEMDOCK, and finally, the accurate docking was made with autodock vina. The docked poses were visualized with PYMOL then saved. The derivatives of the ligand were generated with SWISS ADME, free online software, and selected the derivative for docking. Results: The results obtained from iGEMDOCK and Autodock Vina were tabulated. It was found out that the Azadirachtin and the derivatives are effective in binding 1, 3 β Glucan synthase and thereby inhibiting the formation and integrity of fungal cell wall. Conclusion: In this study, the secondary metabolite Azadirachtin and the derivatives are showing inhibitory action against the model protein 1, 3 β glucan synthase and it was suggested that the external application of the ligand and its derivatives can be used because of their poor oral bioavailability. © 2018 The Authors.

Abstract
BiOI microsquares was prepared by using hexamine as surfactant through solvothermal approach and used as electrode material for high performance supercapacitor. The crystalline structure and morphology of the BiOI were characterized by X-ray diffraction (XRD), field emission scanning electron microscopy (FE-SEM) transmission electron microscopy (TEM) and X-ray photoelectron spectroscopy (XPS) analysis. The electrochemical performance was investigated by using cyclic voltametry (CV) and galvanostatic charge-discharge studies (GCD) using 6M KOH solutions. BiOI electrode exhibits highest specific capacitance of 706 Fg−1 at a current density of 2 Ag−1. This material retained 55% initial capacitance at a higher current density of 10 Ag−1 indicating its better rate performance. © 2017 Elsevier B.V.

Abstract
Background Pranayama, a branch of yoga practice is extremely beneficial to mankind in maintaining sound physical and mental health and this article aims to attain an insight on the studies conducted on the effectiveness of Bhramari Pranayama (Bhr.P) on health. The studies done until May 2016 were found using Medline, Embase, Google scholar and manual search. Studies conducted on the health effectiveness of Bhr.P specifically were included on the basis of prisma guidelines. The data were defined by their objectives, methodology, study setting, findings, interventions done and implications suggested in the study. Methodological Quality Rating Scale (MQRS) and Newcastle-Ottawa Scale (NOS) were used in reviewing and reporting results of the included studies. 6 studies satisfied the inclusion criteria; 2 studies were done on the cold pressor test, one on heart rate and BP, one on EEG changes, one each on the inhibitory response and tinnitus condition. In the included studies, the Bhr.P practices have shown para-sympathetic dominance. There are some encouraging effects of Bhr.P on various physiological systems. Methodological quality of the included studies was evaluated to be very low and none of them were RCTs. Yet the available studies are heterogeneous, dealing in different grounds and this heterogeneity serves as a resource for the limited scope of studies on Bhr.P. Therefore, further large-scale, properly designed, randomized trials of Bhr.P on various systems have to be done to justify these effects efficiently. © 2017 Center for Food and Biomolecules, National Taiwan University

Abstract
Dipteran flies are responsible of myiasis, a common parasitic infestation leading to the invasion of living, necrotic or dead tissues. They also transmit mycobacterial infections to livestock. In the present investigation, seven plant species employed in Southern India for medical and ethno-veterinary purposes were extracted using ethanol or water and tested against second instar larvae of Lucilia sericata. 100% larval mortality was observed testing Lobelia leschenaultiana ethanol extract at 60 mg/L (LC50 = 3.4 mg/L). Based on the highest percentage of larval mortality, we selected L. leschenaultiana for fabrication of ZnO nanoparticles to control L. sericata. Zinc acetate showed 82.2% mortality at 60 mg/L (LC50 = 38.2 mg/L) whereas L. leschenaultiana-coated ZnO nanoparticles (Ll-ZnO NPs) showed 100% mortality at 6 mg/L, the LC50 was 0.78 mg/L. Overall, our research represents an attempt to integrate current ethno-veterinary knowledge from native tribes of Southern India, in order to identify effective botanicals for the development of nano-biopesticides against livestock pests and parasites. © 2017 Elsevier Ltd

Abstract
'Utility computing' was the concept introduced by John McCarthy in 1961 in a speech given at MIT. He proposed that sharing the computing power on a time-sharing basis will help grow business of 'providing computing power as an utility' and this was the inception of the cloud computing. Cloud computing can deliver the best to the end users either through the private, public or hybrid cloud infrastructures. As the databases are of significance importance, it is a mandate that they ought to be designed compatible to the rising cloud technology. Cloud computing has changed the face of the IT industry. But in the current scenario there are many database issues that are not addressed. With tremendous data growth, the need for the paradigm shift in the technology to be used to store, manage and retrieve data is awaited. Databases have changed from file storages to relational databases and further transformed to today's cloud databases. Still the need to process the query efficiently without losing the data privacy had been the topmost priority. The resource optimization and query dynamism are the major unchanged aspects in this changing scenario. The timing constraints on the query execution could be leisurely, indefinite, urgent or instantaneous. In almost all the scenarios, the effective storage, elastic manipulation and efficient data retrieval is the key. © 2017 IEEE.

Abstract
Because of the far reaching accessibility of cell phones, portable specially appointed systems (MANETs) have been generally utilized for different essential applications, for example, military emergency operations and crisis readiness and reaction operations. This is principally because of their framework less property. In a MANET, every hub functions as a host as well as go about as a switch. While getting information, hubs additionally require collaboration with each other to forward the information bundles, along these lines framing a remote neighborhood. These extraordinary elements likewise accompany genuine downsides from a security perspective. Undoubtedly, the previously mentioned applications force some stringent imperatives on the security of the system topology, steering, and information activity. For example, the nearness and joint effort of noxious hubs in the system may disturb the directing procedure, prompting to a breaking down of the system operations. A system [so-called Cooperative Bait Detection Scheme (CBDS)] is introduced that adequately recognizes the vindictive hubs that endeavor to dispatch grayhole/community oriented blackhole assaults. In the proposed conspire, the address of an adjoining hub is utilized as snare goal deliver to goad pernicious hubs to send an answer RREP message, and malevolent hubs are identified utilizing an invert following strategy. Any distinguished noxious hub is kept in a blackhole list so that every other hub that take an interest to the directing of the message are cautioned to quit speaking with any hub in that rundown. The proposed inquire about endeavors to determine this issue by outlining a dynamic source steering (DSR)-based directing system, which is alluded to as the CBDS, that incorporates the upsides of both proactive and receptive guard designs. Our CBDS strategy executes a turn around following method to help in accomplishing the expressed objective. Recreation results will be given, demonstrating that within the sight of pernicious hub assaults, the CBDS outflanks the DSR, 2ACK, and best-exertion blame tolerant steering (BFTR) conventions (picked as benchmarks) as far as parcel conveyance proportion and directing overhead (picked as execution measurements). Additionally, expect to 1) research the achievability of changing our CBDS way to deal with address different sorts of cooperative assaults on MANETs and to 2) explore the incorporation of the CBDS with other surely understood message security plots keeping in mind the end goal to develop a far reaching secure directing structure to ensure MANETs against scoundrels. Also, exhibit the advantages of our plans through reproduction in ns2. © 2017 IEEE.

Abstract
On - chip communication suffer from bit error especially at highly dense implemented system on chip. Reducing the rate of bit error in On-chip communication is carried out by error detection and correction codes. But it has its own limitation. So reconfigurable multiple code based system is suitable for heterogeneous system design. But selecting correct code for the correct subsystem or for current requirements involve good decision system design. More over such selection is fuzzy in nature because heterogeneous subsystem demands different combination of input demands. Here, in this paper a fuzzy controller is designed to select correct error control scheme for the current subsystem demand. The fuzzy controller will take user application demand in terms of minimum required bit rate error, maximum time to compute error code or decode on the receiver side and the correlation level of the input dataset. Fuzzified such input by input membership function is processed by the designed fuzzy controller with 27 rules and selects the appropriate coding scheme. One of the main elements under reconfigurable coding scheme is the communication of selected coding scheme at the given time to decoding unit to enable the decoding process. An efficient frame format with less overhead is designed to communicate the selected coding scheme to the receiver subsystem in order to decode the data. The designed fuzzy controller is tested by random input data and the functionality is verified. © 2017 IEEE.

Abstract
Optimization of On chip communication link in one of the hottest research area in system on chip (SOC) based system design. On chip link are optimized for efficient communication and low power consumption which is trade off in nature. So achieving both efficient communication and low power consumption requires a special optimization mechanism. Evolutionary algorithm of genetic algorithm will be solving such contradictory optimization problems. Here, in this paper genetic algorithm based On chip communication link optimization is presented. The algorithm will optimize efficiency of communication link with constrain of low power consumption. The parameters involved in power consumption and efficient communication link is coded in the chromosomes. By evolutionary iteration the optimal parameters of the communication link is derived that is used for the communication link successfully in the simulated system. The performance of the simulated system is analysed which shows the out performance of the proposed system. © 2017 IEEE.

Abstract

Steganography is the insertion of secret data inside a normal cover media such as digital image, audio, video or text. The inserted message must not be damaged when processing is applied on the cover media. Several image processing operations such as format conversion, lossy and lossless compression, noise removal and other enhancement. This paper presents multi layer image encryption and decryption using random puzzle based method to embed secret data into the cover image. This approach enhances the security and provides robust embedding. In this work, a 8×8 Sudoku puzzle which has a 64×64 reference matrix is used. The proposed method gives a superior average capacity of 5 bits per pixel. The message is embedded at the sender using random permutation puzzle. At the Receiver end, the user has to rearrange the image thereby solving the puzzle. The attacker lacks knowledge of original image order and is unable to solve the puzzle. Our outcome indicate that the recommended approach provides high steganographic security while providing high embedding capacity of about 5 bits per pixel. A brief analysis of the performance and security aspects of the proposed method are presented. © 2017 IEEE.

Abstract
Spinel NixMg1-xFe2O4 (0.0 ≤ × ≤ 1.0) nanoparticles (NPs) were synthesized via sol-gel combustion method and characterized using different techniques such as X-ray powder diffraction (XRD), Fourier Transforms Infrared (FT-IR) spectra, Scanning Electron Microscope (SEM), Energy dispersive X-ray (EDX), Photoluminescence (PL) spectra and Vibrating sample magnetometer (VSM) techniques. The morphological and structural investigations revealed that NixMg1-xFe2O4 (0.0 ≤ × ≤ 1.0) samples posses particle shaped morphologies and exhibited pure crystalline phase of a cubic spinel structure with an average crystalline size of 21.22 nm to 15.65 nm for the samples x = 0.0 to 0.6. FT-IR spectra indicate the bonds between metal and oxygen (M-O) and confirmed the formation of spinel. The magnetic hysteresis (M-H) loops confirmed the ferromagnetic behavior of the synthesized nanoparticles. Photocatalytic activities of spinel NixMg1-xFe2O4 NPs were tested towards the degradation of methylene blue, which revealed that the NixMg1-xFe2O4 nanoparticles with the x 0.6 exhibited the highest degradation efficiency of ~97.77% among other prepared ferrite NPs. Abstract
The leaf of Aurea helianthus (A. helianthus Jinhuakui) is popularly used in China traditional medicine, however, scientific evidence on its antioxidant properties rarely studied. In this study, biological activities of A. helianthus leave's 80% ethanol extract (AHL) were investigated. The measured total polyphenol and flavonoid content of AHL was 184.24 ± 5.01 mg GAE/g and 102.53 ± 0.98 mg NAR/g. AHL showed the highest α α-diphenyl-β-picrylhydrazyl (DPPH) and 2,2′-azino-bis-3-ethylbenzo-thiazoline-6-sulfonic acid (ABTS) radical scavenging activities of 98.30 ± 0.18% at 1000 μg/mL. DPPH and ABTS radical scavenging activities significantly increased in a AHL concentration-dependent manner. AHL treatment significantly suppressed the generation of pro-inflammatory mediators, including nitric oxide (NO), in lipopolysaccharide (LPS)-stimulated RAW 264.7 macrophages. AHL demonstrated strong anti-inflammatory activity that reduced NO production in LPS-stimulated RAW 264.7 cells. To test the potential protective effect of AHL, the antioxidant capacity, on the cell growth, viability of a human hepatoma cell (HepG2) and Raw 264.7 cell were investigated. AHL also enhanced cytotoxicity on the proliferation of HepG2 cells and was capable of inhibiting 56% against LPS at 400 μg/mL. The results of this study the potential of AHL as an excellent antioxidant substance for inhibiting inflammatory mediators. Therefore, AHL may be used as a therapeutic approach to various inflammatory diseases. © 2017 King Saud University

Abstract
The Poisson equation is used to analyze and measure the waveguide in quick and exact calculation of Green's capacity. For this reason, Green's capacity is composed as far as Jacobian elliptic capacities including complex contentions. Another calculation for the quick and precise assessment of such Green's capacity is definite. The principle advantage of this calculation is effectively appeared inside the casing of the Limit Integral Resonant Mode Expansion technique, where a generous decrease of the computational exertion identified with the assessment of the referred to Green's capacity is gotten. © 2017 Institute of Advanced Engineering and Science. Abstract
Cadmium sulfide–Graphene nanocomposite was synthesized by the chemical precipitation method. Phase formation of the CdS–Graphene nanocomposite was inspected with powder X-ray diffraction, the typical surface morphology was done by using field emission scanning electron microscopy and the transmission electron microscopy, equipped with energy dispersion spectroscopy. The different functional groups were identified by using FT-IR and Raman spectroscopy. The optical properties were analyzed using UV absorption spectrum and photoluminescence spectra. The dielectric properties were examined in the different frequencies and the different temperatures. © 2017, Springer Science+Business Media, LLC.

Abstract
Nanotechnology offers a number of nanoscale implements for medicine. Among these, nanoparticles are revolutionizing the field of drug and gene delivery. Chitosan is a natural polymer which provides a profitable tool to an innovative delivery system due to its inherent physicochemical and biological characteristics. Chitosan nanoparticles are promising drug and gene delivery carriers because of small size, better stability, low toxicity, inexpensiveness, simplicity, easy fabrication and versatile means of administration. Chitosan can also be easily modified chemically due to the presence of reactive functional hydroxide and amine groups. Folic acid is commonly engaged as a ligand, for targeting cancer cells, as its receptor, that transports folic acid into the cells through endocytosis and is over-expressed on the surface of several human epithelial cancer cells. Integrating folic acid into chitosan-based drug delivery inventions directs the systems with a well-organized targeting ability. The present review outlines several illustrations of this versatile system based on folate decorated chitosan, which have shown potential as auspicious delivery systems published over the past few years. In addition, it is probable to formulate chitosan nanocarriers that exhibit manifold usage beyond targeted delivery, such as nanotheranostics and cancer stem cell therapy. © 2017. Abstract
Lung cancer is the most common cancer for death among all cancers and CT scan is the best modality for imaging lung cancer. A good amount of research work has been carried out in the past towards CAD system for lung cancer detection using CT images. It is divided into four stages. They are pre-processing or lung segmentation, nodule detection, nodule segmentation and classification. This paper presents in detail literature survey on various techniques that have been used in Pre-processing, nodule segmentation and classification. © 2017 IEEE.

Abstract
Cancer-related fatigue is a symptom of cancer where most patients or the general practitioners tend to misinterpret due to the insufficient understanding or knowledge of cancer-related fatigue (CRF). This paper will provide a better perspective for the patients and the health professionals on how to manage and handle CRF for both mild and severe fatigue patients. Articles were selected from the searches of PubMed database that had the terms 'randomized controlled trials,' 'cancer,' 'fatigue,' 'pharmacologic treatment,' and 'nonpharmacologic treatment' using both Mesh terms and keywords. The authors have reviewed the current hypothesis and evidence of the detailed etiology of the CRF present in the literature for healthier management, directives, and strategies to improve the treatment of cancer-related fatigue. An algorithm has been blueprinted on screening, and management, of the CRF, and various kinds of effective treatments and assessment tools have been briefly studied and explained. Although many strategies seemed promising, the quality of randomized controlled trials is generally quite low in studies, making it difficult to draw conclusions about the effectiveness of each self-care strategies. Therefore, future studies require better design and reporting of methodological issues to ensure evidence-based self-care recommendations for people receiving cancer treatment. © 2017 Journal of Cancer Research and Therapeutics | Published by Wolters Kluwer - Medknow.

Author Keywords
Cancer-related fatigue; complementary and alternative medicine; erythropoietin-stimulating agents; management of cancer-related fatigue; Modafinil; nonpharmacologic treatment; pharmacologic treatments; psychostimulants; randomized controlled trials

Index Keywords
antianemic agent, carnitine, dexmethylphenidate, erythropoietin, methylphenidate, modafinil; algorithm, alternative medicine, cancer fatigue, cognitive behavioral therapy, exercise, health personnel
attitude, human, nonhuman, nutrition, patient attitude, rest, Review, self care, sleep, chemically
induced, complication, fatigue, neoplasm, pathology, quality of life, treatment outcome;
Fatigue, Humans, Neoplasms, Quality of Life, Treatment Outcome

Chemicals/CAS
carnitine, 461-06-3, 541-15-1, 56-99-5; dexmethylphenidate, 19262-68-1, 35652-13-2, 40431-64-9; erythropoietin, 11096-26-7; methylphenidate, 113-45-1, 298-59-9; modafinil, 68693-11-8

Abstract
Around 10 crore women employees i.e. 90% of the women employees are employed in unorganized sector. Unorganized sector includes Agriculture, Seasonal workers, Domestic workers, Construction workers etc. Law Commission of India, in 2015 recommended that the provisions of Maternity Benefit Act, 1961 should cover women workers working in organized as well as unorganized sector, but the government is yet to think over extending the maternity benefit scheme to women in unorganized sector. Presently, the only benefit available to the workers in unorganized sector is Pradhan Mantri Matriva Vandhana Yojana (PMMVY) where they get Conditional Cash Transfer (CCT) of Rs. 6000/- in two installments (Rs. 3000/ each) on fulfilling the conditions. When survey was conducted, it was proved that the reach of PMMVY is very poor, hardly anyone got the benefit. Through Maternity Benefit (Amendment) Act 2017, the labour ministry enhanced the benefit to employees, employed in certain establishments, this may benefit only 1.8 million women employees, but ministry disregards the women employees of unorganized sector. Is it not discrimination? Is it fair to leave this lot out from the ambit of the new law?" © IAEME Publication

Challenges and strategies for retaining women talent in it industry : Managerial strategies for reducing women voluntary turnover in the workplace

(2017) *International Journal of Civil Engineering and Technology*, 8 (10), pp. 13-17. Cited 1 time.

[a] Department of Management Studies, Bharath University, Chennai, India
[b] Faculty of Management Studies, Dr. MGR Educational and Research Institute University, Chennai, India

Abstract
Retaining women talent over a potential career span of 30 years is a common challenge for organizations. Except perhaps public sector enterprises, most companies are facing a situation where the business case for diversity is well acknowledged but the various means deployed to achieve it are proving ineffective as shown by statistics. Losing talented employees can cost an organization in a variety of ways. The organization might lose clients, there may be team disruptions, other employees might be influenced toward leaving the business, and a loss in productivity may occur. As the corporate world is a subset of the society, change is taking place albeit at a slow and steady pace. The need of the hour is to examine the challenges in detail and explore strategies which are being used with some degree of success. © IAEME Publication.

A study on employee welfare in construction industry

(2017) *International Journal of Civil Engineering and Technology*, 8 (10), pp. 7-12. Cited 4 times.

[a] Research Scholar in Management studies, Bharath University, Chennai, India
[b] Depart of Management Studies, Dr. MGR Educational & Research Institute, University, Chennai, India

Abstract
Welfare is anything done by the employer to his employees for the well-being or to improve their standard of living, it may be statutory or voluntary. But as far as India concerned, the welfare benefit whether it be statutory or voluntary is available only to the workers employed in formal sector, who are hardly 10%. 90% of the workers, who are more than 40 crore in number, and employed in unorganised / informal sector like construction, agriculture industry are either deprived their rights. On 29th May, 2017 the Labour Minister Mr. Bandaru Dattatreya said that workers from unorganised sector will be covered under social security schemes such as ESI, EPF. According to him, the government is committed to ensure wages, jobs and social security for all workers including the unorganized sector. It is crystal clear that workers in unorganised sector are living their life below the minimum standard. There are number of labour laws for the safety and security of the formal sector workers but not applied for the workers in unorganised sector. © IAEME Publication.

Abstract
A multiple Vehicle Routing Problem (mVRP), which consists of shaping a set of routes for m vehicles who all start from and return back to a home city (depot). Given a set of cities, let there are m vehicles located at a single depot node. The remaining cities that are to be visited are called intermediate nodes. SP Routing concept is the crucial element in the performance of any network. The Shortest path between any two nodes is mandatory in most of the real world leaning network problems. The intention of this paper is to widen proficient optimization algorithms to solve diverse real world SP routing network problems of high complexity, to find the shortest possible balanced routes for multiple salespersons and to find clustering based simple straight-forward hierarchical SP routing in solar powered WSNs. © 2017, Institute of Advanced Scientific Research, Inc. Morphological characterization and biocontrol effects of Vibrio vulnificus phages against Vibriosis in the shrimp aquaculture environment

(2017) *Microbial Pathogenesis*, 111, pp. 472-480. Cited 8 times.

DOI: 10.1016/j.micpath.2017.09.024

[a] Department of Animal Health and Management, Alagappa University, Karaikudi, Tamil Nadu 630003, India
[b] Sree Balaji Medical College and Hospital, BIHER-Bharat University, Chromepet, Chennai, Tamil Nadu 600044, India

Abstract
The re-emerging field of phage therapy is the potential biocontrol agents for the transfer of virulence factor and to kill their bacterial hosts. In this study, the lytic Vibrio vulnificus phages were studied to provide a better understanding of phage-host interactions and development of phage therapy. Four new V. vulnificus phages were detected from shrimp aquaculture system, named VV1, VV2, VV3 and VV4. All lytic V. vulnificus phages are the Tectiviruses of the family Tectiviridae with typical double layered elongated icosahedral head and tailless morphology. Lytic V. vulnificus phages which infect other Vibrio isolates were further characterized by long term storage, enzymes treatment, organic solvents treatment, detergents treatment, pH stability, temperature stability, agar bioassay method and one-step growth experiment. The effects of chloroform, acetone, ethyl alcohol, methyl alcohol, ribonuclease (RNase), trypsin, protease, Triton-X100 treatments were not affected the growth of VV1, VV2, VV3 and VV4 phages. These phages (VV1-VV4) were inactivated completely with temperature (over 60 °C), pH (<3 or >12), lysozyme and sodium dodecyl sulfate (SDS) treatment. One-step growth experiments indicated that the latent period was at 3 h and burst size was at 37 °C. Agar bioassay method indicated that the percentage of inhibition was 75% (VV1) and 70% (VV2, VV3 & VV4), respectively. SDS-PAGE analysis of all V. vulnificus phages had similar protein patterns with molecular weight masses of 260, 249, 204, 148, 63, 59, 22 and 15 kDa. Hence, it could be concluded that V. vulnificus phage had a broad lytic spectrum and potential biocontrol of luminous Vibriosis in the shrimp aquaculture system. © 2017 Elsevier Ltd

Abstract
This paper reports the preparation of two protic ionic liquids (PILs) 2-methylimidazolium lactate and 2-methylimidazolium acetate through simple proton-transfer reaction by microwave irradiation method. This work further improves the influences of semiconductor metal oxides like CuO (p-type), ZnO (n-type) [two transition metal oxides] and SnO2 (n-type a non-transition metal oxide) over the synthesized PILs. These metal oxides were prepared by sol-gel method and doped over the synthesized ILs by making thin films by spin coating method. The focus of the present study is to learn how the band gap of p-type and n-type metal oxide varies when it is incorporated over the PILs. Their structure, optical properties and morphology were studied through FT-IR, UV-Visible, photoluminescence and XRD spectral studies. © 2017

Abstract
The tick Rhipicephalus (Boophilus) microplus is a key vector of bacterial and protozoan diseases causing heavy economic losses directly and indirectly in animal husbandry. In the past decades, the control of ticks faced some major issues, such as the rapid development of resistance in targeted vectors and non-target effects on human health and the environment, due to the employ of synthetic acaricides and repellents. Eco-friendly pesticides for treating and controlling animal parasites such as ticks were mainly from medicinal plants and thus they form the richest entity for manufacturing resources for drugs. Even though there are efforts made to discover reliable plant-based acaricides to control ectoparasites in animal husbandry, the effective control of R. (B.) microplus ticks still represent a major challenge in current veterinary entomology. Recently, a wide number of promising attempts have been conducted to use herbal preparations and green-fabricated nanoparticles for the control of R. (B.) microplus. The aim of this review is to critically summarize and discuss the use of herbal preparations used in ethno-veterinary as well as green-fabricated nanoparticles as novel acaricides for the control of the cattle tick R. (B.) microplus. © 2017 Elsevier B.V.

Work life integration: Study on how women balance the work & life in the present scenario
(2017) *International Journal of Mechanical Engineering and Technology*, 8 (9), pp. 305-314.

[a] Bharath University, Chennai, India
[b] Commerce Department, Dr. M.G.R Educational and Research Institute University, Chennai, India

Abstract
In the present scenario, it is very difficult for everyone to balance the work life & also personal life. The work scenario is getting more challenging & demanding. When it comes to balancing the work life & personal life, it is even more challenging for women who are working & who also has a strong extended family. Balancing both is very important. When it comes to the conservative mind-set, people still believe that women should do all the domestic work & also help the family financially. They work for 24 hours a day, 7 days a week & 364 days a year.

Author Keywords
Personal success; The issues; Traits needed; Work life balance and women

Abstract
Introduction: Fungal infections of skin, hair, and nails, are common and the incidence rate of these diseases were continuously increasing around 20–25% of the world's population. The clinically important fungal infections are characterized by primary or opportunistic. Cutaneous fungal infections and the emerging multidrug resistance are driving interest in fighting these microorganisms with natural products. Endoproteases are responsible for the cleavage of the various proteins and produce C or N compounds that enable the activity of exoproteases, which is cause for availability of aminoacids like nutrient material for the survival of fungal organism. The phytochemical analysis of the aqueous and ethanol extracts of the leaves of Lawsonia inermis revealed the availability of myriad of secondary metabolites. This lawsone is having the ability to inhibit the invasion of fungal organism probably by inhibiting the M36 metalloendopeptidase known as Fungalysin. By this inhibition it can arrest the purulence of fungal diseases. Methods: The 3D structure of Fungalysin was not available in the pubchem database. Homology model was prepared with software and validated. The physicochemical parameters were obtained for the secondary metabolite, Lawsone and the derivatives and these were docked. The derivatives were generated by SWISS ADME online tool. The files were interconverted with OPENBABEL from.mol to.sdf and.pdb files. Results: The protein and ligand were docked and posed with Pymol and the binding affinity values were obtained by Autodock Vina and were tabulated. The Van der Waals force between the protein and ligands were generated by iGEMDOCK and tabulated. Conclusion: The Fungalysin and Lawsone have a good binding affinity and thereby inhibits the targeted protein thereby inhibits the invasion of fungal organism. © 2017, Pharmainfo Publications. Cloud security and compliance - A semantic approach in end to end security

(2017) *International Journal on Smart Sensing and Intelligent Systems*, 2017 (Specialissue), pp. 482-494. Cited 13 times.

Abstract
The Cloud services are becoming an essential part of many organizations. Cloud providers have to adhere to security and privacy policies to ensure their users' data remains confidential and secure. Though there are some ongoing efforts on developing cloud security standards, most cloud providers are implementing a mish-mash of security and privacy controls. This has led to confusion among cloud consumers as to what security measures they should expect from the cloud services, and whether these measures would comply with their security and compliance requirements. We have conducted a comprehensive study to review the potential threats faced by cloud consumers and have determined the compliance models and security controls that should be in place to manage the risk. Based on this study, we have developed an ontology describing the cloud security controls, threats and compliances. We have also developed an application that classifies the security threats faced by cloud users and automatically determines the high level security and compliance policy controls that have to be activated for each threat. The application also displays existing cloud providers that support these security policies. Cloud consumers can use our system to formulate their security policies and find compliant providers even if they are not familiar with the underlying technology.

Abstract
Big Data concern large-volume, complex, growing data sets with multiple, autonomous sources. With the fast development of networking, data storage, and the data collection capacity, Big Data are now rapidly expanding in all science and engineering domains, including physical, biological and biomedical sciences. This paper presents a HACE theorem that characterizes the features of the Big Data revolution, and proposes a Big Data processing model, from the data mining perspective. This data-driven model involves demand-driven aggregation of information sources, mining and analysis, user interest modeling, and security and privacy considerations. We analyze the challenging issues in the data-driven model and also in the Big Data revolution.

Author Keywords
Data storage; Demand-driven; HACE

A new approach for cloud data security: From single to Cloud-of-Clouds

(2017) *International Journal on Smart Sensing and Intelligent Systems*, 2017 (Specialissue), pp. 604-613.

DOI: 10.21307/ijssis-2017-273

Abstract
In the corporate world, a large number of people store their data on clouds. For doing this they need to give their confidential data in the hands of the third party, commonly known as service providers. These cloud service providers cannot be trusted since the complete data is stored in one single cloud. This increases security risks to the user's sensitive data. Due to this issue of data integrity risk and service availability failure, the concept of "Cloud-of-Clouds" comes into picture. Cloud-of-clouds are also known as "inter-clouds" or "multi-clouds". Use of cloud-of-clouds provides a higher level of security to the user's confidential data. The aim of this paper is to secure the user's data by using cloud-of clouds.

Wireless Zigbee Network Cluster - Capacity calculation and secure data conveyance using indegree

(2017) *International Journal on Smart Sensing and Intelligent Systems*, 2017 (Specialissue), pp. 174-185. Cited 1 time.

DOI: 10.21307/ijssis-2017-244

Abstract
A tree topology is used to construct to construct a Zigbee networks practices by wireless sensor network for data delivery applications. There are 3 types of nodes in zigbee networks; coordinator, router and mobile end devices. Coordinator performs the initialization and maintenance functions in the network. A router is responsible for routing data between the coordinator and mobile end device. In-order to avoid the delivery failures occurs due to node movements and network topology changes, the existing system collect and analyze data about device movement and gives Zigbee node deployment and tree construction framework, which uses three algorithms ZND(zigbee node deployment), ZCD(zigbee coordinator decision) and ZTC(zigbee tree construction). In the proposed system we improve the data delivery by introducing the capacity calculation. If any two nodes have same number of indegree or out-degree, we select the node with maximum capacity.

Abstract

Schizophrenia is a complex psychiatric disorder characterized by memory impairments with delusions and hallucinations. Several investigations have focused on determining the association between NOS1 (nitric oxide synthase-1) polymorphisms and risk of schizophrenia (SZ). However, the association of rs2682826, rs3782206, rs499776, rs3782219, rs41279104, rs3782221, rs1879417, rs4767540, rs561712, and rs6490121 polymorphisms with schizophrenia remains inconclusive. We performed a systematic meta-analysis for each polymorphism to determine its association with SZ by calculating their pooled odds ratio and 95% confidence intervals. The heterogeneity between studies was evaluated using Cochran's Q test to adopt random effects or fixed effects model. Based on our analysis, the rs3782206 polymorphism showed a strongest association with schizophrenia in allelic OR 1.15 (95% CI [1.05–1.25]), homozygote OR 1.35 (95% CI [1.09–1.66]), dominant OR 1.16 (95% CI [1.04–1.29]), and recessive OR 1.29 (95% CI [1.05–1.58]) models in Asian population. Similarly, in Caucasian population, the rs499776 polymorphism attributes risk association in homozygote OR 0.70 (95% CI [0.50–0.98]), dominant OR 3.57 (95% CI [2.34–5.27]), and recessive models OR 0.68 (95% CI [0.50–0.93]) with schizophrenia. Further, the sensitivity analysis was carried out based on leave-one-out method to confirm the reliability of the analysis. Overall, our meta-analysis demonstrates the significance of NOS1 genetic variants that are functionally associated with cognitive and neuropsychiatric symptoms of schizophrenia. © 2017, Springer Science+Business Media, LLC.

Abstract
Design of scaffolds with natural substances holds potential in several cardiovascular applications. In this study, we have fabricated scaffold using the electrospinning technique with blends of PU and castor oil. The characterization was performed using scanning electron microscopy (SEM), Fourier transform and infrared spectroscopy (FTIR), thermogravimetric analysis (TGA), contact angle measurement, and atomic force microscopy (AFM). Further the blood compatibility of prepared composites was calculated using APTT, PT, and hemolytic assay. SEM analysis of the fabricated scaffolds indicated random morphology of nanofibers with reduced fiber diameter of about 766 ± 147 nm compared to pristine PU control. The FTIR confirms the interaction between PU and castor oil as identified by the formation of hydrogen bond. The developed composite rendered hydrophobic nature owing to increased contact angle and also exhibit higher thermal stability as shown by TGA. The AFM analysis revealed that the surface roughness of the nanocomposites was observed to be improved compared to control. A delay in the activation of clot was noted in activated partial thromboplastin time (APTT) and partial thromboplastin time (PT) assay revealing the anticoagulant nature of the fabricated scaffolds. Moreover, the hemolytic index of developed composites was found to be low indicating the safety of the scaffold in protecting the red blood cells from damage. The present study suggested that newly developed nanocomposite enabled tailoring of desirable characteristics matching for cardiac tissue engineering. © 2017, Springer Science+Business Media, LLC.

Abstract
Practice of dermatology has been revolutionised with the introduction of topical corticosteroids (TCS).The ever-expanding search to maximise their effects while minimising their side effects has been complemented by synthesising newer molecules with modified chemical structures. The TCS are a class of primarily synthetic steroids with profound anti-inflammatory and antipruritic action. With this most sought-after therapeutic property, a long list of "steroid responsive dermatoses" has emerged into contemporary dermatologic practice. Success of treatment however depends on the accurate diagnosis and selection of the appropriate steroid molecule with relevant consideration of the delivery vehicle, potency, frequency of application, site of involvement, duration of treatment, and strict vigil on the side effects. One has to remember that no single agent has been proven to have the best benefit-to-risk ratio. This chapter deals concisely with the aforementioned and specially is directed against TCS abuse. © Springer Nature Singapore Pte Ltd. 2018. All rights reserved.

Abstract
Search engines are a dime a dozen today. Trawling the net for content with specific keywords and using particular algorithms reduces search time. The existing search engines work only by means of related keywords, and their success largely depends on the weight of the keywords in question. As a general rule, however, search engines lose the connect between the semantic relationship of the keyword and the content. Our proposed method concentrates on creating an ontology for a healthcare system. A neural network back-propagation algorithm is used to retrieve content for keywords, during that retrieval, it deals with healthcare ontology. This methodology deals with a comprehensive approach to the contents of the system. For application purposes, this method is constructed by means of a semantic relationship with a decision tree. It underlines the explicit relationship between the keywords and their corresponding contents. © 2017 Research Journal of BioTechnology. All rights reserved.

Abstract
Handedness is considered as the most obvious type of behavioral and cognitive asymmetry reported in human beings. Also we have footedness in the motor domain. This study investigated the percentage distribution and their significance for handedness and footedness in both sexes of adolescent age group in both left and right handers based on laterality preference inventory. Handedness got a significant result whereas footedness score has no significance based on the laterality preference inventory. © RJPT All right reserved.

Abstract
Nickel molybdate (NiMoO4) nanoparticles (NPs) were synthesized by sol–gel method. Utilizing water as solvent provides crystalline nanostructures. These nanocrystals were structurally characterized by X-ray diffraction, energy dispersive X-ray analysis (EDX), and Fourier transform infrared spectra. Compositional stoichiometry was confirmed by EDX technique. The size and shape were observed by scanning electron microscopy (SEM) and transmission electron microscope (TEM). It was found that the obtained NPs were pure and single phase crystalline with monoclinic structure. The optical properties were studied by ultraviolet–visible diffuse reflectance spectroscopy (UV–Vis–DRS) and photoluminescence (PL) measurements at room temperature. The magnetic properties were studied by vibrating sample magnetometer (VSM) and results showed superparamagnetic behavior of the obtained nanoparticles. Photocatalytic activity of NiMoO4 was studied. The photocatalytic activity of NiMoO4 was enhanced with the addition of TiO2. The catalysts NiMoO4, TiO2 and NiMoO4–TiO2 nanocomposites (NC) were tested for photocatalytic degradation (PCD) of 4-chlorophenol (4-CP). It was found that PCD efficiency of NiMoO4–TiO2 NC was higher than that of pure NiMoO4 and TiO2. © 2017 The Nonferrous Metals Society of China

Reuse of advanced treated sewage for seawater intrusion barrier - A case study
(2017) *International Journal of Civil Engineering and Technology*, 8 (8), pp. 1556-1562. Cited 2 times.

[a] Civil Engineering Department, Bharath University, Chennai, Tamilnadu, India
[b] Chennai Metropolitan Water Supply and Sewerage Board and Technical Adviser to IIT Madras for Decentralised Sewerage, India

Abstract
It is well known that potable water is one of the very much essential domestic needs for people. The need is increasing day by day as the population increases. Although several methods are available to treat sewage for production of potable water, each method has its own merits and limitations. This paper describes a case study made for Chennai city, India to convert sewage in to useful water. Orange County model (California) has been adopted for reuse of advanced treated sewage. The disposal of R O reject can be a deep sea disposal because the feed to R O itself is sterile. The cost of this additional treatment will be just about Rs. 20 per 1000 liters at best. Over a period of time, nearly all the treated sewage can be recovered from inland as extracted water and from a location where it is needed because the aquifer is spread across the metropolitan region vastly. © IAEME Publication.

Enhancement of durability properties of bioconcrete incorporated with nano silica
(2017) *International Journal of Civil Engineering and Technology*, 8 (8), pp. 1388-1394. Cited 22 times.

[a] BIHER, Bharath University, Selaiyur, Chennai, India
[b] CSIR-Structural Engineering Research Centre, Taramani, Chennai, India

Abstract
Bacterial concrete, the so called Smart bio material is an eco-friendly concrete in which selective cementation takes place by microbiologically induced CaCO3 .This method is introduced to remediate even micro cracks, voids and pores. Based on experimental investigation carried out the paper presents the results to enhance the mechanical and durability properties by means of introducing Enterobacter sp. in the concrete. The bacterium used in this study has the ability to precipitate calcite is the calcite precipitating bacteria which is readily mixed in the concrete. The precipitated calcite contains crystalline structure that has the ability to readily adhere to the concrete and completely arrests the rise of micro cracks and pores. In addition it has the ability to continuously grow upon itself when it comes in contact with any medium which is highly insoluble in water. The presence of nano-silica in the concrete enhances the C-S-H formation. The strength contribution in the specimen is due to the presence of organic substances. It is available as microbial biomass that is required for the biomineral precipitation. The Organic source adopted here is the yeast extract. A successful attempt has been made on the biomineralization process to enhance the compressive strength, split tensile strength and durability properties of concrete by using the Enterobacter sp. This biological treatment shows promising prospect in increasing strength aspects of the concrete. © IAEME Publication.

Retrospective analysis of a theoretical model used for forecasting future air quality near the north Chennai thermal power plant

(2017) *International Journal of Civil Engineering and Technology*, 8 (8), pp. 1457-1467. Cited 21 times.

[a] BIHER, Bharath University, Chennai, India
[b] Department of Civil Engineering, Annamalai University, Annamalainagar, Tamilnadu, India

Abstract
The trend of gathering of Baseline Air Quality data commenced in Chennai as early as 1981, as an academic exercise, undertaken by some post-graduate students of the Centre for Environmental Studies in Anna University, Chennai (1,2,3,4). The study revealed that the baseline air quality data were only at moderate levels, in respect of the three major air pollutants, namely, Sulphur Dioxide (SO2), Nitrogen Dioxide (NO2), and Suspended Particulate Matter (SPM), in Ennore-Manali Industrial area. All these pollutants measured for the respective averaging times, were below the National Ambient Air Quality Standards prescribed for each pollutant, respectively. Therefore, it was possible to convince the Department of Environment & Forests, Government of India, New Delhi, that the Environmental Clearance be given, for the proposed establishment of the 3x210 MW coal-fired thermal power plant in the Ennore Island location, with the financial assistance from the Asian Development Bank to the Tamil Nadu Electricity Board. The present status of air quality in the same area needs to be assessed in the light of the Revised National Ambient Air Quality Standards, especially in view of the newly introduced parameters, namely, PM10 and PM2.5, which were not in force in the year 1986. There are a few more industries which have come up after 1986, and which have relevance to emission of air pollutants, namely, SO2, NO2, and SPM (inclusive of PM10 and PM2.5), having adverse effects on human health. © IAEME Publication.

Abstract
Being cheapest in earlier days the natural sand used in concrete without any alternate even though natural sand containing organic impurities, clay and silt content more than permitted level. Due to excessive mining the river basin environment got affected, the demand for fine aggregate increased and the prevailing market unable to meet the need. Nowadays crushed sand also called as manufactured sand being used as an alternate to natural sand partially or fully. Even though manufactured sand used in normal construction activities, it is not used in high rise structures involving special concretes. Hence it is necessary to study the properties of special concrete with various replacement proportions of fine aggregate by manufactured sand. This will safeguard environment river basin and at the same time unwanted accumulation of crusher dust will put into better use than being used as mere filling material. Experiments conducted on M60 grade concrete with fine aggregate replacement proportion 0%. 25%, 50%, 75% and 100%. The properties such as compressive strength, split tensile strength and ultrasonic pulse velocity are determined from cubes and cylinders cast with manufactured sand procured from kundrathur and river sand taken from Araniar basin. The replacement of 75% natural sand by manufactured sand recommended as this proportion gives comparatively better results in special concrete such as high performance concrete. Hence the manufactured can be used in high performance without any doubt which will also improve the environment as well as sustainability of construction industry. © IAEME Publication.

Abstract
Electrospinning is an emerging tool and promising method to fabricate polymer nanofibers. The aim of this work was to fabricate electrospun polyurethane mats reinforced with murivenna oil for wound dressings. The scanning electron microscopy (SEM) micrographs showed the fiber diameter of nanocomposites in the range of 740 ± 160 nm and found to be decreased compared to pure polyurethane. Surface of nanocomposites was analyzed by Fourier transform infrared spectroscopy (FTIR) insinuated the interactions between PU and murivenna oil by the formation of hydrogen bond and changes in the characteristics peaks. Contact angle of the PU incorporated murivenna oil showed a decrease in its value compared to pure PU indicating the increased wettability and hydrophilic nature. The thermal degradation and stability of fabricated composites was found be enhanced compared to pure PU. The surface morphology through atomic force microscopy (AFM) analysis showed a change in surface roughness due to presence of murivenna oil in the polymer matrix. In blood compatibility results, both activated partial thromboplastin time (APTT) and prothrombin time (PT) were delayed due to improved surface properties and the addition of murivenna oil in the PU matrix. Compared to pure PU, the hemolysis assay of the PU incorporated murivenna oil showed a significant decrease in the percentage of lysis of red blood cells indicating better blood compatibility. Following the results, it was confirmed that fabricated novel scaffolds having better physicochemical and enhanced blood compatibility properties may be utilized for wound dressing. © 2017 Elsevier Ltd

Abstract
Reliable and trustful data aggregation is needed for most application in Wireless Sensor Networks. In this paper, we propose a new approach to attain data and key privacy protection in data aggregation called Preserving Data and Key Privacy in Data Aggregation for Wireless Sensor Networks (PDKP).Existing privacy preserving protocol provide more computational and communicational overhead in the sensor nodes. It increases the consumption of energy among the nodes. In our scheme, the encrypted content of the data is shared without revealing the data and key to other nodes by using simple technique. It preserves the key and data from an adversary with less computational and communication overhead. The base station can identify the distrustful groups related to the set of group aggregates and the retransmission of data is performed only for the abnormal data sensing intermediate nodes. It preserves the various security issues such as data freshness, data integrity, data confidentiality in data aggregation. Our simulation result showed that implementation of PDKP reduces the communication overhead and increases energy efficiency. © 2017 IEEE.

A novel imputation method for effective prediction of coronary Kidney disease

(2017) *Proceedings of the 2017 2nd International Conference on Computing and Communications Technologies, ICCCT 2017*, art. no. 7972256, pp. 127-136. Cited 19 times.

Abstract

Kidney disease is become a popular disease in around the world. The prediction of kidney disease is highly complex task while handling huge dataset. The kidney disease dataset contain patients information such as age, blood Pressure levels, albumin, sugar, counts of red blood cells etc., in the dataset there may be some missing values in some features that values may be important to predict kidney disease. Due to such missing values in the dataset will decrease the accuracy of kidney disease prediction. Several methods were proposed to fill up these missing values. An existing classification framework used a data preprocessing method but here the data cleaning process has been made in order to fill the missing values and to correct the erroneous ones. A recalculation process is performed on the chronic Kidney disease (CKD) stages and the values were recalculated and filled in for unknown values. Though this method is efficient, the influence of expert in the field of healthcare dataset values for CKD is needed. So to avoid this need and improve the preprocessing as a layman, Weighted Average Ensemble Learning Imputation (WAELI) is proposed. In this proposed work the single value imputation model used expectation-maximization (EM) and Random Forest (RF) which predict the missing values effectively in small dataset. For huge dataset the multiple value imputation model predict the missing values with the help of RF, Classification And Regression Tree, C4.5 are used to estimate the missing value. Hence the accuracy of kidney disease prediction will be improved by using WAELI. Then introducing priority assigning algorithm to assign priority for each features in the dataset then higher priority features are carried over for classification process. This makes classification process more efficient and time consumption for classification will be reduced. © 2017 IEEE.

Abstract
As extensive measure of information is created in medicinal associations (healing centers, therapeutic focuses) yet as this information is not appropriately utilized. Here, information mining is the way toward dissecting diverse parts of information and amassing it into helpful data. As of late, Machine Learning systems have been effectively used in an alternate applications incorporating to help with therapeutic finding. It is exceptionally easy and on time to prepare for patients to break down illness in view of clinical and lab side effects with suitable information and gives more proficient outcome for particular ailment. At that point classification is an information mining assignment by and large utilized as a part of therapeutic information mining. In this manuscript study of the execution measure of a machine learning strategy, neural system and Naive Bayes Classifier calculation for grouping side effects based anticipation for drug treatment is executed. Utilizing Naive Bayes, the general speed and precision of the calculation expanded and remove high quality information set from an unstructured content. The Naive Bayes is a standout amongst the best order calculations. In numerous basic leadership frameworks, positioning execution is a fascinating and attractive idea than just arrangement. So to augment conventional Naive Bayes, and to enhance its execution, community oriented channel and preprocessing idea is consolidated. The manifestations bringing about diabetes and treatment drug are recognized and are connected to the expectation display in view of which the forecast is finished. It is utilizing two manifestations based dataset preparing. Gathering dataset after the application of preprocessing for expels commotion and neural system procedure for preparing and testing of dataset. The examination module breaks down the research center test reports of the manifestations levels of the patient and gives appropriate consciousness messages to the patient through outcomes. The objective here is to find new and helpful examples to give significant and valuable data about diabetes to the patient. © 2017, Institute of Advanced Scientific Research, Inc. Abstract
Background: Understanding the mechanical properties is important in predicting the clinical behavior of composites. Finite element analysis (FEA) evaluates properties of materials replicating clinical scenario. Aim: This study evaluated polymerization shrinkage and stress, wear resistance (WR), and compressive strength (CS) of silorane in comparison with two methacrylate resins. Settings and Design: This study design was a numerical study using FEA. Materials and Methods: Three-dimensional (3D) models of maxillary premolar with Class I cavities (2 mm depth, 4 mm length, and 2.5 mm width) created and restored with silorane, nanohybrid, and microhybrid; Groups I, II, and III, respectively. Loads of 200-600 N were applied. Polymerization shrinkage was first determined by displacement produced in the X, Y, and Z planes. Maximum stress distribution due to shrinkage was calculated using AN SYS software. 3D cube models of composite resins were simulated with varying filler particle size. Similar loads were applied. WR and compressive stress were calculated: K W L/H and load/cross-sectional area, respectively. Statistical analysis done using one-way ANOVA, Kruskal-Wallis, and Tukey's honestly significant difference test (P < 0.05). Results: Polymerization shrinkage (0.99%) and shrinkage stress (233.21 Mpa) of silorane were less compared to microhybrid (2.14% and 472.43 Mpa) and nanohybrid (2.32% and 464.88 Mpa). Silorane (7.92×/1011 μm/mm3) and nanohybrid (7.79×/1011) showed superior WR than microhybrid (1.113×/1017). There was no significant difference in compressive stress among the groups. Conclusion: Silorane exhibited less polymerization shrinkage and shrinkage stress compared to methacrylates. Silorane and nanohybrid showed greater WR compared to microhybrid. CS of all groups was similar.

Abstract
Cost optimization is one of the essential elements for any company, to be competitive and successful in global market. This paper explains various methodologies of Cost optimization and its effectiveness for each type of products. It also proposes the right timing to do Cost optimization, to fetch maximum benefits. The word Cost optimization might look very simple exercise, however efficiency of this activity depends on how well it is linked with company's Development process and Product strategies. This paper describes different phases of New Product Development as per Advanced Product Quality Planning and the level of product cost frozen at every stage. Cost as seen by Customers and Company is studied to understand the differences of Importance given by customers. It is further analyzed in deep, to explain the importance of synergy between Cost optimization and Company strategy on Product development. Advantages and Challenges of different ways of Cost optimization analyzed and a recommendation made on what and how the Cost optimization can be synergized with Development process and Product strategy with which Cost optimization efficiency can be ensured. © IAEME Publication.

Abstract
Atrial septal defect (ASD) constitutes 30–40% of all congenital heart diseases in adults. The most common complications in the treatment of ASD are embolization of the device and thrombosis formation. In this research, an occluding patch was developed for ASD treatment using a well-known textile technology called electrospinning. For the first time, a cardiovascular occluding patch was fabricated using medical grade polyurethane (PU) loaded with bioactive agents namely chitosan nanoparticles (Cn) and collagen (Co) which is then coated with heparin (Hp). Fourier transform infrared spectrum showed characteristic vibrations of several active constituents and changes in the absorbance due to the inclusion of active ingredients in the patch. The contact angle analysis demonstrated no significant decrease in contact angle compared to the control and the composite patches. The structure of the electrospun nanocomposite (PUCnCoHp) was examined through scanning electron microscopy. A decrease in nanofiber diameter between control PU and PUCnCoHp nanocomposite was observed. Water uptake was found to be decreased for the PUCnCoHp nanocomposite against the control. The hemocompatibility properties of the PUCnCoHp ASD occluding patch was inferred through in vitro hemocompatibility tests like activated partial thromboplastin time (APTT), prothrombin time (PT) and hemolysis assay. It was found that the PT and APTT time was significantly prolonged for the fabricated PUCnCoHp ASD occluding patch compared to the control. Likewise, the hemolysis percentage was also decreased for the PUCnCoHp ASD patch against the control. In conclusion, the developed PUCnCoHp patch demonstrates potential properties to be used for ASD occlusion. © 2017, Springer-Verlag GmbH Germany.

Abstract
A new series of six protic ionic liquids (PILs) comprising substituted imidazolium cations paired with lactate or glycolate anions were synthesized for cellulose dissolution. All the six synthesized PILs were able to dissolve about 5 wt% of cellulose. Especially, 1-ethyl imidazolium lactate showed highest dissolution power since 5 wt% of cellulose solution was obtained within 20 min at 80 °C. The effects of dissolution temperature on cellulose dissolution time were also investigated. As the dissolution temperature increases, dissolution time reduces significantly. The regeneration of cellulose with higher yield was achieved by adding anti-solvent like deionized water to the cellulose solution. Both the initial and regenerated cellulose samples were characterized by X-ray diffraction (XRD), thermogravimetric analysis (TGA) and scanning electron microscope (SEM) analysis. The results showed that the crystalline structure of initial cellulose (cellulose I) gets converted to cellulose II. In addition, all regenerated cellulose possessed nanostructure and lower thermal decomposition temperature than the initial cellulose and had new vistas in the industrial applications. © 2016 Elsevier B.V.

Abstract
Solid polymer blend electrolytes are widely studied due to their extensive applications particularly in electrochemical devices. Blending polymer makes the thermal stability, higher mechanical strength and inorganic salt provide ionic charge carrier to enhance the conductivity. In these studies, 50% polyvinyl alcohol (PVA), 50% poly (N-vinyl pyrrolidone) (PVP) and 2.5% L-Asparagine mixed with different ratio of the Ammonium bromide (NH4Br), have been synthesized using solution casting technique. The prepared PVA/PVP/L-Asparagine/doped-NH4Br polymer blend electrolyte films have been characterized by various analytical methods such as FT-IR, XRD, impedance spectroscopy, TG-DSC and scanning electron microscopy. FT-IR, XRD and TG/DSC analysis revealed the structural and thermal behavior of the complex formation between PVA/PVP/L-Asparagine/doped-NH4Br. The ionic conductivity and the dielectric properties of PVA/PVP/L-Asparagine/doped-NH4Br polymer blend electrolyte films were examined using impedance analysis. The highest ionic conductivity was found to be 2.34×10−4 S cm−1 for the m.wt. composition of 50%PVA:50%PVP:2.5%L-Asparagine:doped 0.15 g NH4Br at ambient temperature. Solid state proton battery is fabricated and the observed open circuit voltage is 1.1 V and its performance has been studied. © 2017 Elsevier B.V.

Abstract

The present investigation comprised of experimental study of conventional milling of AISI D3 Steel and Tin coated inserts by using cryogenic CO2 as a coolant. The main objective of the analysis was to use the Taguchi technique to detect the impact of dynamic parameter viz. Cutting speed, feed, depth of the cut on the roughness of the work piece material. The goal was to comparatively study under dry and wet conditions and observe the effect of cryogenic CO2 as a coolant with CVD TiN coated as a insert tool. Finally cutting temperature, roughness, Material Removal Rate (MRR) and tool wear were measured. Finally SEM observation was made to analyze the tool wear and the data was complied into MINITAB -17 for Taguchi analysis. Mainly surface roughness and MRR were investigated employing Taguchi design. © Informatics Publishing Limited & Indian Society for Surface Science and Technology. All rights reserved.

Abstract
SiC reinforced polyester nano-composites have been investigated to explore its thermal behavior and the possibilities of its performance improvement. This has been accomplished through addition of small amount of nano sized particles to the composite and by subjecting it to conduct of subsequent experimentations. Nano-composites find applications in the manufacture of special and process equipments. In this study, the composite is fabricated using a weight ratio of 30% for SiC which is reinforced with the remaining polymer matrix. Studies were done to understand the morphology and thermal behavior by conducting different tests and analysis such as thermal conductivity test, TGA and FE- SEM analysis. © 2017, Informatics Publishing Limited & Indian Society for Surface Science and Technology. Abstract
Fast and accurate transmission of diagnostic images is vital in providing successful medical outcomes. Image compression algorithms play a key role in this process. This article deals with the medical image compression applications since the improvement in image compression filed is in particular related to the need of active and powerful techniques for the storage and transmission of images. To gain the maximal competencies of storage and transmission, special compression algorithms should be compared to find an efficient technique for medical image compression. The proposed unbelievable excellent and efficient image compression methodology with strong regenerative compressed data without loss, based on SBIC (Successive Blocks Interframe Coding), is a superior method for compressing MRI (Magnetic Resonance Imaging), CT (Computed Tomography) and US (Ultrasound) images. This conclusion is based on mathematical analysis of the test data plus visual analysis of regenerated test images. The compression ratio of these medical images using the proposed algorithm produced a 70-80% compression ratio improvement over JPEG-LS, JPEG and JPEG2000 methods without degradation of the tested images. Conclusion faster image transfer and reduced storage costs plus increased efficiencies in healthcare delivery systems. The results were evaluated in terms of PSNR (Peak Signal to Noise Ratio), MSE (Mean Square Error), MAE (Maximum Absolute Error) and RMSE (Root Mean Square Error). © Copyright 2017 American Scientific Publishers All rights reserved.

Role of anatomical landmarks in identifying normal and transitional vertebra in lumbar spine magnetic resonance imaging

(2017) *Asian Spine Journal*, 11 (3), pp. 365-379. Cited 8 times.

DOI: 10.4184/asj.2017.11.3.365

Abstract
Study Design: Retrospective study. Purpose: Identification of transitional vertebra is important in spine imaging, especially in presurgical planning. Pasted images of the whole spine obtained using high-field magnetic resonance imaging (MRI) are helpful in counting vertebrae and identifying transitional vertebrae. Counting vertebrae and identifying transitional vertebrae is challenging in isolated studies of lumbar spine and in studies conducted in low-field MRI. An incorrect evaluation may lead to wrong-level treatment. Here, we identify the location of different anatomical structures that can help in counting and identifying vertebrae. Overview of Literature: Many studies have assessed the vertebral segments using various anatomical structures such as costal facets (CF), aortic bifurcation (AB), inferior vena cava confluence (IC), right renal artery (RRA), celiac trunk (CT), superior mesenteric artery root (SR), iliolumbar ligament (ILL) psoas muscle (PM) origin, and conus medullaris. However, none have yielded any consistent results. Methods: We studied the locations of the anatomical structures CF, AB, IC, RRA, CT, SR, ILL, and PM in patients who underwent whole spine MRI at our department. Results: In our study, 81.4% patients had normal spinal segmentation, 14.7% had sacralization, and 3.8% had lumbarization. Vascular landmarks had variable origin. There were caudal and cranial shifts with respect to lumbarization and sacralization. In 93.8% of cases in the normal group, ILL emerged from either L5 alone or the adjacent disc. In the sacralization group, ILL was commonly seen in L5. In the lumbarization group, ILL emerged from L5 and the adjacent disc (66.6%). CFs were identified at D12 in 96.9% and 91.7% of patients in the normal and lumbarization groups, respectively. The PM origin was observed from D12 or D12-L1 in most patients in the normal and sacralization groups. Conclusions: CF, PM, and ILL were good identification markers for D12 and L5, but none were 100% accurate. © 2017 by Korean Society of Spine Surgery.

Abstract
Introduction: Stress has been known to be a potential modulator of learning and memory. Long term stress can lead to depression. Fluoxetine is a selective serotonin reuptake inhibitor group of drug used in the treatment of depression. Aim: The present study was conducted to evaluate the potential of Fluoxetine on cold restraint induced stress in the hippocampus of Wistar rats. Materials and Methods: A total of 18 male wistar albino rats were divided randomly into 3 groups (n=6). Group 1 was the control group which were kept in normal laboratory conditions. Group 2 was the negative control group which were given cold restraint stress for period of four weeks. Group 3 was the experimental group, where the animals were pretreated with fluoxetine 10 mg/kg for a period of one week followed by cold restraint stress for 30 minutes and cotreated with fluoxetine 10 mg/kg for a period of four weeks. The whole study was done for a period of five weeks followed by behavioural studies and subsequently sacrificed with removal of brain for various histological, Immunohistochemical (IHC), neurochemical and antioxidant analysis. The values were expressed as Mean±SEM. One-way analysis of variance followed by Tukey's multiple comparisons test was used for the comparison of means. A probability of 0.05 and less was taken as statistically significant using Prism Graphpad software version 6.01. Results: The results show there was significant improvement in the Morris water maze test after treatment with fluoxetine in Group 2. Similar results were also noted in the levels of neurotransmitters and antioxidant levels in brain and also in the number of cells counted in IHC and histological studies by H&E when Group 3 was compared with Group 2. The treatment reversed the damage in Group 2 which was comparable with the control group. Conclusion: The results revealed that administration of fluoxetine 10 mg/kg given orally has a potential antistressor effect by improving the neurogenic and neuroprotective effect on the cold restraint stress induced hippocampal damage. © 2017, Journal of Clinical and Diagnostic Research. Abstract
Diet plays a crucial role in cancer advancement as well as prevention. Breast cancer is the second leading cause of cancer death among women. Recent research links breast cancer with diet and some evidence for the preventive effect of diet against breast cancer was also documented. The growth of cancer cells is influenced by natural sweetener honey and its multitude of phenolic phytochemical components. Honey has been used medicinally by ancient Greeks and Egyptians and also traditionally exploited in Ayurveda and Chinese medicine. In this paper, the anti-cancer properties of honey and its phytochemical's action against breast cancer have been summarized. They result in apoptosis by enhancing reactive oxygen species level, activating mitochondrial pathway, initiation of pro-apoptotic and anti-apoptotic proteins, induction of p53 pathway that finally cause DNA fragmentation. However, there is a necessity for more proteomic and genetic-based experiments to understand its molecular mechanism to promote honey and its phenolic markers as plausible candidates for breast cancer treatment. Further, there is a need for quality check of honey available in the market, which warrants significant investigation by researchers in the food industry to ensure their attributes.

Abstract
The good features of subset are selected correctly, then, the entire set gives compatible results. For this purpose, feature subset selection is used in the highdimensional data. The proposed Fast Clustering Algorithm is used for selecting the subset of features. A Fast clustering algorithm renders efficiency and effectiveness to discover the subset of features. Fast clustering algorithm work can be done in two steps. The first step is to moving out irrelevant features from the dataset, the irrelevant features are removed by the features having the at value above the predefined threshold. And the second step is to eliminating the redundant features from the dataset, the redundant features is removed by constructing the Minimum Spanning Tree and separate the tree having the edge distance more than its neighbor to form the separate clusters, from the clusters features that are strongly associated with the target features are selected to form the subset of features. The Fast Clustering Algorithm is more efficient than the existing features subset selection algorithms RELIEF, FCBF, INTERACT, CFS, FOCUS. © 2017 IAEME Publication.

Abstract
Introduction: Functional reconstruction of jaw defects due to surgical resection is a challenge in maxillofacial surgery. The fibula free flap in combination with dental implants has exhibited growing popularity for such reconstructions. This study aimed at evaluating the clinical and functional outcome of dental implants inserted in fibula free flaps and dental implants used for orofacial reconstruction following ablation of tumors. Materials and methods: A clinical follow-up study of 10 patients was conducted after oral surgery, who received vascularized fibula bone grafts and endosseous implants for functional jaw reconstruction during a 12-year period. The follow-up protocol included a clinical examination and radiological evaluation and interview using a questionnaire. Information on postoperative recovery after the surgical reconstruction phase and implant placement, type of diet, swallowing problems, speech intelligibility, lip competence, and perceived facial appearance was collected and analyzed. Results: The survival rate of fibula free flap was 100%. The survival and success rates of implants placed in the fibula flaps at the end of the follow-up period were 100 and 94% respectively. Conclusion: Implants placed in fibula bone grafts have been shown to integrate normally. Surgical reconstruction with vascularized fibula bone grafts followed by placement of dental implants after jaw resection can provide good clinical and functional outcomes for oral rehabilitation with a prosthesis. © 2017, Jaypee Brothers Medical Publishers (P) Ltd. Abstract

Due to the wide extension of power electronics equipment in modern electrical systems, the increase of the harmonics disturbance in the alternating currents has became a major concern due to the adverse effects on all equipments. The equipment will develop harmonic pollution source of the system, which generate many disturbances, and interrupt the optimal operation of electrical equipments. These equipments draw non-linear currents from the source as compare to traditional loads such as motors and resistive heating elements. This work, proposed a solution to eliminate the harmonics introduced by the nonlinear loads. The analysis and simulation using Matlab Simulink of active power filter (SAPF) compensating the reactive power and harmonics produced by nonlinear loads in steady and in transients states. Hence the simulation approach for SAPF is used to diminish the harmonics and gives improved power factor with reduced THD using Mat lab Simulink in order to develop new fuzzy logic controller based SAPF. © 2016 IEEE.

Abstract
The Cloud services are becoming an essential part of many organizations. Cloud providers have to adhere to security and privacy policies to ensure their users' data remains confidential and secure. Though there are some ongoing efforts on developing cloud security standards, most cloud providers are implementing a mishmash of security and privacy controls. This has led to confusion among cloud consumers as to what security measures they should expect from the cloud services, and whether these measures would comply with their security and compliance requirements. We have conducted a comprehensive study to review the potential threats faced by cloud consumers and have determined the compliance models and security controls that should be in place to manage the risk. Based on this study, we have developed an ontology describing the cloud security controls, threats and compliances. We have also developed an application that classifies the security threats faced by cloud users and automatically determines the high level security and compliance policy controls that have to be activated for each threat. The application also displays existing cloud providers that support these security policies. Cloud consumers can use our system to formulate their security policies and find compliant providers even if they are not familiar with the underlying technology. © 2017 IAEME Publication.

Abstract
The objective of this work is to characterize and investigate the blood compatibility of polyurethane (PU)/mustard oil composites fabricated using electrospinning technique. The fabricated scaffold was characterized using scanning electron microscopy (SEM), Fourier transform infrared spectroscopy (FTIR), atomic force microscopy (AFM), thermogravimetric analysis (TGA) and contact angle measurements. The activated partial thromboplastin time (APPT), prothrombin time (PT) and the hemolytic assay were done to investigate the blood compatibility of the developed composites. The SEM results revealed that the fiber diameter of the composites (761±123 nm) was reduced compared to pristine PU control. The interaction between PU and mustard oil was confirmed by FTIR as evident through the shifting of peaks. The fabricated composites depicted hydrophobic behavior as insinuated by the increase in contact angle measurements. PU/mustard composites displayed improved crystallinity as confirmed by TGA. Atomic force micrographs suggested that developed PU/mustard oil composites showed an increase in the surface roughness (Ra) compared to pure PU. The Ra of pure PU was observed to be 723 nm but for the fabricated PU/mustard oil composite the Ra was found to be 1298 nm (Ra). The hemolytic index value for pure PU and fabricated composites was observed to be 2.73%and 1.15% indicating that developed composites showed a non-hemolytic behavior signifying the safety of the composites with red blood cells. Hence the newly developed composites with improved physicochemical and blood compatibility properties may be considered as a potential candidate for fabricating cardiac patches and grafts. © 2017 by the authors. Abstract
Introduction: Prostatic cancer is most commonly seen in individuals greater than 65 years of age. The incidence rates are constantly increasing. Aim: To assess the accuracy of the non-contrast sequences {Diffusion Weighted Imaging (DWI) and Magnetic Resonance Spectroscopy (MRS)} in the multiparametric Magnetic Resonance Imaging (mp-MRI) in identifying and differentiating benign and malignant prostate lesions using endorectal coil on 1.5 T MRI. Materials and Methods: Twenty-six patients with clinical indications for prostate lesions were evaluated using endorectal coil on 1.5 T MRI. DWI and MRS were obtained in all the lesions. Signal change on T2 weighted images, Apparent Diffusion Coefficient (ADC) values and choline + creatinine to citrate ratios (Cho+Cr/Ci) of the lesions were obtained for all the patients. All the patients underwent Transrectal Ultrasound (TRUS) guided biopsy within one week of MRI study. Signal change on T2 weighted images, DWI and Cho+Cr/Ci ratios were correlated with the histopathological findings using appropriate statistical analysis (Wilson score). Results: Of the 26 patients, seven had benign pathology and 19 had malignant pathology on the histopathological examination. Sensitivity and specificity (89.5% and 85.7% respectively) of the diagnosis of malignancy basedon DWI were quite good. Positive and negative predictive values were also very much acceptable (94.4% and 75% respectively). Though, MRS had good sensitivity and Positive Predictive Value (PPV) (84.2% and 76.2% respectively), specificity and Negative Predictive Value (NPV) were poor (28.6% and 40% respectively). Accuracy of imaging diagnosis based on combining T2, DWI and MRS was same as that of results based on T2 signal alone (80.8%) and had higher sensitivity and lower specificity than DWI alone (94.7% and 42.9% respectively). Receiver Operating Characteristic (ROC) curves were calculated for ADC values and Cho+Cr/Ci ratios. The Area Under the Curve (AUC) for ADC is 0.74 and for Cho+Cr/Ci is 0.70 Conclusion: Comparing the accuracy of the non-contrast sequences T2, DWI and MRS in identifying and differentiating benign and malignant lesions, giving weightage to the MRS in mp-MRI reduces the negative predictive value. The diagnosis of malignancy based on diffusion restriction was quite good and it can be the workhorse for prostate cancer detection as a shortened mp-MRI. © 2017, Journal of Clinical and Diagnostic Research. Abstract
This work reports the preparation of cadmium oxide (CdO) thin films with different molar concentrations on glass substrate by simple and low cost SILAR (Successive Ionic Layer Adsorption and Reaction) method. The characterization, XRD pattern confirmed the presence of polycrystalline CdO in the deposited thin films with the cubic structure. The surface morphology and elemental composition of prepared thin films have been examined by scanning electron microscopy equipped with energy dispersive X-ray (EDX) analysis system. The optical property of the films was analyzed by UV–visible spectroscopy. The band gap of the deposited thin films was estimated by Tauc's plot and it was found to be 2.6–2.8 eV. The prepared thin films were examined for the decomposition of the Methylene Blue (MB) dye which was visualized by UV-Visible spectroscopy, by decreasing the intensity of absorbance and concentration. © 2017, Springer Science+Business Media New York.

Abstract
Background: Mitochondrial dysfunction and oxidative stress are the main toxic events leading to dopaminergic neuronal death in Parkinson's disease (PD) and identified as vital objective for therapeutic intercession. This study investigated the neuro-protective effects of the demethoxycurcumin (DMC), a derivative of curcumin against rotenone induced neurotoxicity. Methods: SH-SY5Y neuroblastoma cells are divided into four experimental groups: untreated cells, cells incubated with rotenone (100nM), cells treated with DMC (50nM)+rotenone (100nM) and DMC alone treated. 24h after treatment with rotenone and 28h after treatment with DMC, cell viability was assessed using the MTT assay, and levels of ROS and MMP, plus expression of apoptotic protein were analysed. Results: Rotenone induced cell death in SH-SY5Y cells was significantly reduced by DMC pretreatment in a dose-dependent manner, indicating the potent neuroprotective effects of DMC. Rotenone treatment significantly increases the levels of ROS, loss of MMP, release of Cyt-c and expression of pro-apoptotic markers and decreases the expression of anti-apoptotic markers. Conclusions: Even though the results of the present study indicated that the DMC may serve as a potent therapeutic agent particularly for the treatment of neurodegenerative diseases like PD, further pre-clinical and clinical studies are required. © 2017 The Author(s).

Author Keywords
Apoptosis; Demethoxycurcumin; Neurodegenerative diseases; Oxidative stress; Rotenone

Index Keywords
caspase 3, caspase 6, caspase 8, caspase 9, cytochrome c, demethoxycurcumin, protein BAD, protein Bax, protein bcl 2, protein bcl xl, reactive oxygen metabolite, rotenone, curcumin, cytochrome c, demethoxycurcumin, insecticide, neuroprotective agent, plant extract, reactive oxygen metabolite, rotenone; apoptosis, Article, BAD gene, Bax gene, Bcl 2 gene, Bcl xL gene, caspase 3 gene, caspase 6 gene, caspase 8 gene, caspase 9 gene, cell structure, cell survival, cell viability, controlled study, Cyt c gene, dose response, drug effect, drug potency, gene, gene expression, human, human cell, mitochondrial membrane potential, MTT assay, neuroblastoma cell, neuroprotection, neurotoxicity, oxidative stress, protein depletion, protein expression, protein secretion, analogs and derivatives, cell death, chemistry, Curcuma, dopaminergic nerve cell, drug effects, metabolism, Neurotoxicity Syndromes, Parkinson disease, phytotherapy, tumor cell line; Cell Death, Cell Line, Tumor, Cell Survival, Curcuma, Curcumin, Cytochromes c, Dopaminergic Neurons, Humans, Insecticides, Membrane Potential, Mitochondrial, Neuroprotective Agents, Neurotoxicity Syndromes, Oxidative Stress, Parkinson Disease, Phytotherapy, Plant Extracts, Reactive Oxygen Species, Rotenone

Abstract
Introduction and Aim: The placenta is the most accurate record of the infant's prenatal experiences. The fetus, cord and the placenta constitute genetically identical parts of a unit that share the uterine environment. The present study is aimed to document the morphological features of placenta in both term and preterm pregnancies and to correlate baby weight and placental volume. Materials and Methods: A total number of 51 placentae of various trimesters, both preterm and term along with the clinical history of mother and details of baby from Department of Obstetrics and Gynaecology, Sree Balaji Medical College and Hospital, Chennai was collected. Results: Of the 51 placentae collected, 27 were from term and 3 from pre-term pregnancies. Remaining 21 included placentae from post-abortion and medical termination of pregnancies-of which 9 were from the first trimester, and 12 were from the second trimester. Morphological analysis of placentae of II and III trimesters were concordant with those reported in the literature. Conclusion: Morphometry is an indirect and non-invasive approach to the study of the physiology and pathology of gestation in the human. Morphometry is a good adjuvant to histopathology.

Abstract
The dairy industry like most other agro-industries generates strong wastewaters with high biological and chemical oxygen demands representing the high organic content. The let out of untreated wastewater may cause serious problems in terms of organic load on the local municipal sewage treatment systems. The study examined the mediator-less microbial fuel cell (MFC) for the treatment of whey wastewater with simultaneous current generation in the presence of E. coli. The maximum current generated using whey wastewater was 3.019–6.99 W/m2/d with a constant resistance of 10 Ω with 0.1 N potassium permanganate as catholyte with carbon and graphite as electrodes respectively. The graphite electrodes were able to produce more current when compared to the carbon electrodes. During the study a biomass concentration of 3.042 g/l with a CO2 production of 13–20 mg/l as NaCO3 and H2 production of 20–25 ml/d respectively were obtained. The distance between the electrode and the Proton Exchange Membrane (PEM) and the distance between the electrodes in case of the dual electrodes also played an important role in the power generation. SEM image evidences the bio-film formation on the electrodes that supported the power density and a COD removal of 91–98% was also obtained. This phenomenon could be utilized to design an inexpensive autonomous system consisting of graphite or carbon electrodes, an electrical load and a recordable voltmeter to track energy generation due to E. coli fermentations. In the near term, these fuel cells could be utilized as a research tool for metabolic studies where the current response of microbial fuel cells would be extremely useful.

Abstract
One of the known aberrations in root canal morphology of maxillary second permanent molars is the presence of collateral mesiobuccal canals. This case report describes the endodontic management of a maxillary second molar that had a single fused root with six canals that was successfully managed with the aid of dental operating microscope. Six canal orifices were located namely MB1 (Mesiobuccal), MB2, MB3, DB1 (Distobuccal), DB2 and palatal. During the cleaning and shaping, instrument separation occurred at the apical third of the palatal canal which was removed with ultrasonics. After cleaning and shaping, the canals were obturated with resin sealer and laterally condensed gutta-percha. The patient was recalled for periodic review. After two years of follow up the patient remained asymptomatic. Cone Beam Computed Tomography (CBCT) evaluation revealed satisfactory periapical status. © 2017, Journal of Clinical and Diagnostic Research. All rights reserved.

Abstract
Background Epidemiological studies have shown a link between periodontitis and atherosclerosis. Hence the present study was chosen to assess the presence of eight anaerobic periodontal pathogens and their virulence genes in subgingival plaque (SGP) and atheromatous plaque (AP) of patients who underwent Coronary artery bypass graft surgery (CABG). Methods SGP and AP collected from 65 CABG patients were screened for the presence of periodontal bacterial pathogens by Polymerase chain reaction. The samples positive for Porphyromonas gingivalis, Treponema denticola and Tannerella forsythia were screened for virulence genes. Chronic periodontitis patients (ChP) without any systemic disease (n = 59) and healthy subjects free of both periodontitis and systemic disease were included as control groups (n = 100). Results and discussion Statistical significance was observed for the prevalence of 16S rRNA of P. gingivalis, T. forsythia, T. denticola and P. nigrescens both in SGP and AP. Nine different periodontal bacterial co-occurrences were observed in SGP and AP of CABG patients. Besides, the prevalence of these nine different bacterial co-occurrence was high in SGP OF CABG patients compared to ChP without systemic disease. Among the nine different bacterial co-occurrence, only four were observed in SGP of ChP without systemic disease in spite of high prevalence of these anaerobic bacterial species. While, bacterial co-occurrences was completely absent among healthy subjects. Significant odds and risk ratio to atherosclerosis were observed for P. gingivalis, T. forsythia, T. denticola and P. nigrescens. Among the virulence genes, significance to atherosclerosis was observed for P. gingivalis type II fimA and T. forsythia bspA. Conclusion The results of this study strongly correlate periodontal bacterial co-occurrence and periodontal bacterial adhesion factor to atherosclerosis. © 2017 Elsevier Ltd

Abstract

Slotted springs provide linear and repeatable spring elements that fit within confined volume and remain in line when they stroke. With cross slot configuration, they do not tilt or rotate when exercised. Product design stays within fatigue limits and features inherently square ends. Single-piece construction can include mounting flanges, attachment threads, and other fittings. © 2016 IEEE.

Abstract
Collection, storage and utilization of solar energy by solar water heating by flat plate collector and evacuated tube is cheapest and effective renewable energy technologies. This solar water heater design uses a nonconventional source of energy which can be used for house hold applications. The cost of production will be comparatively low in cost and high in capacity. The G.I. sheet collector boxes are replaced by copper tube, stainless steel water tank, thick costly PUF insulations and toughened glass etc. Pebbles are used as a medium of heat storage this increases the capacity of solar water heater by using this method natural source of energy can be used instead of depending on electric water heaters. © Published under licence by IOP Publishing Ltd.

Abstract
Biodiesel is an alternative fuel for diesel engine. The methyl esters of vegetable oils, known as biodiesel are becoming increasingly popular because of their low environmental impact and potential as a green alternative fuel for diesel engine. This paper deals with the manufacturing process of Biodiesel from jatropha and neem oil. Biodiesel was prepared from neem oil and jatropha oil, the transestrified having kinematic viscosity of 3 & 2.6 centistokes, methanol ratio is 6:1 & 5.1respectively. The secondary solution is preheated at 65 C & 60 C and reaction temperature is maintained at 60C & 55 C and reaction time is 60 minutes approximately with NaOH catalyst and low viscosity oil is allowed to settle 24 hours. The average yield of neem and jatropha methyl esters was about 85%. These methyl esters shows excellent alternative under optimum condition for fossil fuels. © Published under licence by IOP Publishing Ltd.

Earlier diagnose of sinusitis in frontal and maxillary cavities using near infrared radiations
(2017) *Journal of Computational and Theoretical Nanoscience*, 14 (3), pp. 1640-1643.

DOI: 10.1166/jctn.2017.6489

[a] Sathyabam University, Jeppiaar Nagar, Chennai, Tamilnadu, 600119, India

Abstract
Earlier diagnose of sinusitis in patients, still a challenging task to physicians. However, various imaging techniques such as CT, PET, and X-ray detect the sinusitis in severe stage. In this paper, we propose a novel method for sinusitis detection with Near Infrared (NIR) Diode and detector. The NIR diode transmits the optical light to the frontal and maxillary cavity regions. The detector observed the reflected light from the regions and analyzed for earlier detection of sinusitis. The reflected signals from the regions have a change in the optical path length proportional to the moisture content in the cavities. Optical path length and amplitude changes in the reflected signals measured with FFT spectral response and analyzed with LSSVM. The LSSVM correlates the optical path length and sinusitis measured in the laboratory. From simulations and Hardware implementation results of the 150 samples, we detect the sinusitis in the earlier stage and able to achieve an accuracy of about 91% in sinusitis detection. © 2017 American Scientific Publishers All rights reserved.

Abstract
Every organization needs to have well trained and experienced people to perform the activities that have to be done. Thus employees' training is not only an activity that is desirable but also an activity that an organization must commit resources to if it is to maintain a viable and knowledgeable work force. The concept of Training has changed from the time it got evolved. The delivery methodology is extremely important, as the success of the training is directly related to the methodology handled in the training program. © IAEME Publication.

Image compression technique using successive blocks interframe coding
(2017) *Journal of Theoretical and Applied Information Technology*, 95 (8), pp. 1703-1710.

[a] Department of ETCE, Sathyabama University, Chennai, India

Abstract
A powerful technique for compressing images is very essential because the raw images needs huge amount of disk space which seems to be a disadvantage for transmission and storage. Though many compression techniques available in the field; a technique is needed which should be faster, more memory efficiency and simple that meets the requirements of the compression vs. quality. In this paper, we proposed a lossless method of image compression and decompression using a technique called Successive Blocks Interframe Coding (SBIC). This technique is simple in implementation and utilizes less memory. An algorithm has been refined and executed to compress and decompress the given images using SBIC technique in MATLAB R2014b simulation tool. The experimental results shows that the SBIC technique is most powerful and gives a good compression ratio without any data loss; while decompresses it reproduces the original image without any loss of data with the same 100% original file quality. © 2005 – ongoing JATIT & LLS.

Abstract
Cobalt oxide (Co3O4) nanocatalyst was synthesized by sol-gel method using the protic ionic liquid namely 1-butylimidazolium glycolate as solvent and stabilizer. The obtained Co3O4 nanocatalyst was characterized by powder X-ray diffraction (XRD), Fourier transform infrared, High resolution scanning electron microscopy (HR-SEM), Energy dispersive X-ray (EDX), High resolution transmission electron microscopy (HR-TEM), Selected area electron diffraction, UV–Visible diffuse reflectance spectroscopy, Photoluminescence spectroscopy, Brunauer–Emmett–Teller surface area and Vibrating sample magnetometer (VSM). Powder XRD results showed the well-crystalline cubic structure of synthesized Co3O4 with size of 19.29 nm. Also, the sphere-like morphology of Co3O4 nanocatalyst was confirmed by HR-SEM and HR-TEM images. Furthermore, the synthesized Co3O4 nanocatalyst possessed optical band gap values of 1.75 and 2.46 eV and hence acted as a semiconducting material. In addition, the presence of small hysteresis loop in Magnetic measurement (VSM) confirmed the ferromagnetic nature of Co3O4 nanoparticles. Moreover, the synthesized Co3O4 nanocatalyst found to be used in photo-catalytic degradation of methylene blue and exhibited 94.61% efficiency. © 2016, Springer Science+Business Media New York.

Abstract
In this present study, Mn2+doped CoAl2O4 (MnxCo1−xAl2O4; x = 0.0 to 1.0) spinel nanoparticles were synthesized by microwave combustion method using nitrates of Co, Mn, and Al as the starting materials and urea was used as the fuel. The effects of Mn2+ doping on structural, morphological, opto-magnetic and catalytic properties were studied. Powder X-ray diffraction analysis was confirmed the formation of cubic spinel aluminate structure. Debye-Scherrer's formula was used to estimate the average crystallite size of the samples and was found to be in the range of 18.26 to 21.47 nm. It was observed that the calculated lattice parameter value is increased from 8.215 to 8.247 Å with increasing the Mn2+ content due to the higher ionic radius of Mn2+ ion. High resolution scanning electron microscopy (HR-SEM) and transmission electron microscopy (HR-TEM) analysis confirmed the nano-sized particle-like morphology of the samples. Energy dispersive X-ray (EDX) results showed the pure form of spinel aluminate structure. The band gap energy (Eg) of undoped CoAl2O4 was estimated to be 3.58 eV from UV-visible diffuse reflectance spectroscopy (DRS), and the Eg values increased with increase of Mn2+ ions due to the decrease of grain size. The magnetic hysteresis (M-H) loop showed the superparamagnetic nature of the samples, and the saturation magnetization values increased with increasing Mn2+ ions, which was confirmed by vibrating sample magnetometer (VSM). All compositions of the samples were successfully tested as catalyst for the conversion of benzyl alcohol into benzaldehyde and observed good catalytic activity. © 2016, Springer Science+Business Media New York.

Abstract
In this paper, we have described system for mining opinions from traffic status tweets. The opinions are categorized as positive (p) and negative (n). We collected a corpus of around 5000 traffic related tweets using twitter API. These tweets were then cleansed from unwanted contents and processed. The processed tweets were converted into a bag of words and manually labeled as "p" or "n" appropriately. This labeled dataset was then split into training and test set in the ratio of 80:20. Various classifier algorithms were trained on this set and validated. Based on the performance of the algorithms the top 7 among them were chosen to form an ensemble model. This ensemble model was then used to classify the test set. We obtained an F-measure of 87.15 which indicates that our system is quite competitive in mining opinions about traffic status from tweets. © IAEME Publication.

Study of damaged RC beams repaired by bonding of CFRP laminates
(2017) *International Journal of Civil Engineering and Technology*, 8 (2), pp. 470-486. Cited 27 times.

[a] Dept of Civil Engineering, Bharath University, Chennai, Tamilnadu, India
[b] CSIR -Structural Engineering Research Centre Taramani, Chennai, Tamil Nadu 113, India

Abstract
This paper summarizes the results of experimental studies of damaged reinforced concrete beams repaired by bonding of carbon fibre reinforced polymer (CFRP) composite laminates to the beam. Two sets of beams have to be test in this study: control beams (without CFRP laminates) and damaged and then repaired beams with different amounts of CFRP laminates by varying different parameters (damage degree, CFRP laminate width, concrete strength class).All beams have to be tested under simply supported condition.The test has to be done under two point loading using the Universal testing machine over a span of 1500 mm. The tests were carried out under displacement control. The most investigated parameter in this experimental study is damage degree (ratio between pre-cracked load and load capacity of control beam). To evaluate the strength of damaged RC beams with externally bonded CFRP laminates have the target of this project. The experimental failure modes are peeling off and interfacial de-bonding. These failure modes depend only on the laminate width. © IAEME Publication.

Abstract
Repair and strengthening of R.C beam is now becoming more and more important in the field of structural strengthening and retrofitting. The present paper reviews the study of Glass Fiber Reinforced Polymer (GFRP) flats under flexural behavior in reinforced concrete beams. In this study, experimental investigation on the flexural behavior of RC Beam has been studied by wrapping Glass Fiber Reinforced Polymer (GFRP) sheets. Reinforced Concrete Beam externally bonded with GFRP sheets were tested to failure using a symmetrical two point static loading system. Six Reinforced Concrete Beams have been cast for this experimental test. All cast beams are weak in flexural and having same reinforcement detailing. Three beams are used as control beams and three beams are strengthened using full bottom of glass fiber reinforced polymer (GFRP) sheets. The experimental result shows, that full bottom GFRP sheet wrapping in 70% preloaded beam can increase flexural capacity of the beam by 14%(on ultimate load) as compared to Controlled Beams. © IAEME Publication.

Retrofittng of reinforced concrete beams using GFRP overlays
(2017) *International Journal of Civil Engineering and Technology*, 8 (2), pp. 423-439. Cited 28 times.

[a] Dept. of Civil Engineering, Bharath University, Chennai, Tamilnadu, India
[b] CSIR-Structural Engineering Research Centre, Taramani, Chennai, Tamil Nadu 113, India

Abstract
For strengthening and rehabilitating of RCC beams, the utilization of externally bonded fiber reinforced polymer sheets has been found effective. To increase the load carrying capacity of the structural beam as well as to increase the service life of the beam retrofitting with FRP sheets especially GFRP sheets found most suitable and economical. This paper is intended for experimental studies of damaged reinforced concrete beams repaired by bonding of Glass fiber reinforced polymer (GFRP) overlays to the beam. The three sets of beams has to be tested in this study: control beams (without GFRP overlays) and damaged and then repairing beams with GFRP overlays by varying different parameters (damage degree, GFRP overlay width,). All beams have to be tested under simply supported condition. The testing has to be done under two point loading using the load frame over a span of 1500 mm. The tests were carried out under displacement control. The most investigated parameter in this experimental study is to determine increase in load carrying capacity of strengthened beam. To evaluate the strength of damaged RC beams with externally bonded GFRP laminates was the target of this project. © IAEME Publication.

Abstract
Cloud computing is an emerging technology which has become an important portion of many organization to store their data. Cloud provides services to customers in a cost effective manner. But still many consumers hesitate to invest in cloud because of many security issues addressed in cloud computing. There are many security control measures developed by many organizations but there exists confusion among the cloud users. This paper defines what the threats are so far identified in cloud computing. The security issues include problems from both the cloud service providers and the organization. There must be proper mapping of standards to appropriate security model. This ensures confidentiality of data. The various standards adopted to overcome all those threats are also explained here. © 2017, Institute of Advanced Scientific Research, Inc. All rights reserved.

Improved energy efficient multi-hop WSN using novel routing mechanism with hull convex function
(2017) *Journal of Advanced Research in Dynamical and Control Systems*, 9 (6), pp. 118-125.

[a] Department of Computer Science and Engineering, Bharath University, Chennai, India
[b] Department of Computer Science, Pondicherry University, Pondicherry, India

Abstract
Wireless sensor networks (WSNs), recently emerges as an essential means for computing applications. The main concern associated over the pervasive computing is its unbalanced consumption of energy in multi-hop environments. The uneven dissipation of energy in many-to-one traffic pattern, reduces the network throughput. The information from the nodes of the multi-hop sensor networks are necessarily routed to the sinks. Hence, the energy consumption for an individual transmission depends prominently on the adjacent hop node. The conventional research in such energy aware routing approaches aims at reducing the consumption of energy in networks, which maximizes the lifetime of the network. The paper investigates the energy consumption in the multi-hop networks by proposing a novel traffic mechanism with a cluster based approach that aims on two goals: limiting the consumption of nodes' energy and improving the fairness. To achieve such aim, we further consider this as a nonlinear problem and the optimal solution is obtained through a convex function. The simulated results proved the effectiveness of the proposed method over multi-hop WSNs. © 2019, Institute of Advanced Scientific Research, Inc.. All rights reserved.

Abstract
Kidney disease is one of most dangerous disease spreading all over the world due to the change in our life style, including food habits, environment, etc. so it is essential to choose any remedy to avoid as well as predict the disease in early stage which helps to save the life. The prediction of kidney disease can be done efficiently using Priority assigning algorithm. It is done with the help of Attribute selection method. Attribute (Feature Selection) selection to support kidney disease detection. It is made by eliminating the attributes of less importance and also to select the important attribute to be present in the dataset. But existing algorithm does not suit for imbalanced dataset or large number of distinct values. In this paper, a new algorithm called priority assigning algorithm has been introduced in order to assigns high priority for more important features. This makes the classification process efficient and kidney disease can be predicted efficiently. © Research India Publications.

Abstract
The Chronic Kidney disease is the most important health issues concerning the people as a whole. Chronic diseases lead to morbidity and increase of death rates in India and other low and middle income countries. The chronic diseases account to about 60% of all deaths worldwide. 80% of chronic disease deaths worldwide also occur in low and middle income countries. In India, probably the number of deaths due to chronic disease found to be 5.21 million in 2008 and seems to be raised to 7.63 million in 2020 approximately 66.7%. Data mining is the process of extraction of hidden information from the large dataset. Major data mining techniques such as clustering, classification, association analysis, regression, time series and sequence analyses were used to predict kidney diseases. The techniques that were introduced so far had minor drawbacks in the quality of preprocessing or at any other stages. In this paper, the various data mining techniques are surveyed to predict kidney diseases and major problems are briefly explained. © Research India Publications.

Abstract
A cloud storage system utilized to store huge volume of data in storage server. The cloud system is utilized to give huge number of storage servers, which offers long term storage services through the internet. The cloud third party system does not give data confidentiality. In cloud constructing centralized storage system create hackers easily stole the cloud data. Therefore, the general cloud data encryption schemes give the data confidentiality. Thus, in this work Schmidt-Samoa Public Key Encryption (SSPKE) method based on Enhanced Boosting Algorithm (EBA) with Data hiding Architecture is proposed. Additionally in this work use multi-party protocol access control for manipulate and access the user's data without affecting the sensitive cloud data confidentiality. The experimental results shows that the promising result in term of considering different kinds of metrics such as overall processing time, server response time and data decomposition rate. © 2017, Institute of Advanced Scientific Research, Inc. Abstract
Cloud computing plays a key role towards the world for data sharing. In order to outsource the data in a secure manner the encryption scheme plays an important role in the cloud because sensitive information present in the cloud potentially causes privacy problems. Most of the encryption techniques will split the file in different hunk then the file is encrypted and store on multiple cloud where rather storing complete file on single cloud system. But if any one of the sliced file is corrupted it's difficult to rearrange the original file format. The proposed KBR agent will store the keys and data with high security in DVM with low budget for the client requirement. The proposed model KBR agent is creating Dynamic Virtual Machines (DVM) based on the Threshold keys and storing those secret keys in the DVMs which perform the high security on keys data and the integrity is maintained by storing the encrypted data in CSP (Cloud Service Provider). © Medwell Journals, 2017.

Performance evaluation of positive output multiple lift-push-pull switched capacitor LUO converters with PI and Fuzzy controllers

(2017) *Journal of Advanced Research in Dynamical and Control Systems*, 9, pp. 2669-2678.

Abstract
The micro-power-consumption technique requires high power density DC/ DC converters and power supply sources. In this work, a PI and Fuzzy Logic Controllers for an Elementary circuit of Positive Output (P/O) Push-Pull Switched Capacitor Luo Converter has been developed for high power density applications with high sustainability under enormous line and load disturbances. The proposed converter combines both switched-capacitor and voltage lift techniques. Referable to the time-varying and switching nature of the power electronic converters, their dynamic behavior becomes highly non-linear. Conventional controllers are incapable of providing excellent dynamic performance and hence the fuzzy logic controller can be used as a feedforward controller for controlling power electronic converters. The control algorithm is developed to ensure tracking of the reference voltage and rejection of system disturbances by successive measurements of the converter output voltage at certain time instants within a conduction period. The simulation of PI and Fuzzy logic controls have been carried out using MATLAB/ Simulink software to evaluate the controller's performances. Further, the simulation results show Fuzzy controller performs effectively for the preferred converter. © 2019, Institute of Advanced Scientific Research, Inc. All rights reserved.

Performance of PI controller for fourth order resonant power converter with capacitive output filter
(2017) *Journal of Advanced Research in Dynamical and Control Systems*, 9, pp. 3273-3282.

[a] Bharath Institute of Higher Education and Research Centre, Chennai, 600073, India
[b] Sasurie Academy of Engineering, Kariyampalayam (PO), Sathy Road, Coimbatore, 641653, India

Abstract
An efficient loop approach of the fourth order (LCLC configuration) resonant converter has been contrived and exposed in this paper. The PI controller has been used for self-supporting loop response and the attitude of considered converter has been estimated mutually the closed loop and the uncover loop condition. The consistent state-transient responses of nominal clog, sudden horizon and load disturbances have been obtained to confirm the controller performance. The proposed control is proposed to provide transcend voltage process for dynamic load conditions. © 2017, Institute of Advanced Scientific Research, Inc. All rights reserved.

Abstract
The temporomandibular (TMJ) joints are multipart structures containing muscles, ligaments, bones and neurovascular bundle. Surgery for TMJ disorders represents a significant risk of facial nerve damage that can result in facial weakness affecting patients' mental health, ability to communicate and self-image. This case report examined the effect of electrical stimulation in the treatment of facial palsy. A 15 year old male patient with a left sided facial palsy came with the history of TMJ surgery exactly at 7th day after surgery. The patient was functionally assessed by House Brackmann method, neurologically evaluated by strength duration (SD) curve and graded by Sunderland's classification of peripheral nerve injury. The SD curve was plotted at 0 week and then at 1st and 2nd week after subjecting the patient to electrical stimulation, facial massage and 'Y' shaped facial adhesive strap. The prognosis of the patient shows the shift of the SD curve to the left which indicates near normal complete re-innervations after treating with electrical stimulator for a month. It was concluded that electrical stimulation may improve the facial paralysis and decrease the psychosocial influence on the patient. © 2017 Published by Oriental Scientific Publishing Company.

Abstract
India is the world capital for Oral cancer. The chemo preventive actions of many natural compounds were known to our fore-fathers in prehistoric era. These natural compounds are potent, less toxic and have greater biocompatibility. Natural compounds have been extensively studied over decades for various diseases including cancers. Curcumin is one of the important natural chemo preventive drug used for various cancers. It plays very important role in apoptosis, reduction of inflammation in tumour microenvironment. In this article we tried to elucidate the action of “Curcumin” in OSCC and potentially malignant disorders. Here we highlight Curcumin can be a promising therapeutic drug. © 2017 Published by Oriental Scientific Publishing Company.

Abstract
Chitosan is a natural polymer that can be modified into chemically different types. In order to imply biomedical applications, the chitosan dissolved in aqueous medium. Therefore, in the present study, functionally substituted chemical groups such as O-carboxymethyl chitosan (CMC), N-succinyl chitosan (NSC), quaternary ammonium chitosan (QAC) and tripoly phosphate chitosan (TPC) were synthesized. The peptide derived from Clarias batrachus was used as a drug that is successfully entrapped with NSC nanoparticles and were characterized by FTIR, AFM, SEM, Zeta sizer, fluorescent imaging and SDS-PAGE. In addition, antimicrobial activity was examined. The results of NSC obtained particle size (~64 nm) with highest solubility and 80% of antimicrobial activity against multidrug resistant pathogen Klebsiella pneumonia. Finally, the release profile indicates that the NSC nanoparticles deliver the peptide with 75% sustainable release and good availability up to 96 h. The current research was the first to report the characterization of peptide with NSC nanoparticles by SDS-PAGE, in which the antimicrobial activity was enhanced up to 80%, the particle sizes were obtained ~64 nm from SEM and AFM, and NSC-peptide exhibited 75% of sustainable release and good availability up to 96 h. © 2009-2016 OAHOST.

Abstract
Calliandra haematocephala commonly known as powder puff has wide range of therapeutic properties like anti inflammatory, anticonvulsant, immunomodulatory and blood purifier. Previous Studies showed the antibacterial activity of the flowers and bark of Calliandra haematocephala, So this study is designed to evaluate the antibacterial activity of the ethanolic extract of the leaves of "Calliandra haematocephala" against selected gram positive and gram negative strains. The leaves of Calliandra haematocephala was subjected to soxhlet extraction using organic solvent of ethanol. The antibacterial activity of Calliandra haematocephala extract was done using standard disc diffusion method using Muller Hinton agar (MHA) against ten strains of bacteria (Three gram positive and Seven gram negative strains). Ampicillin is the standard positive control and 20µl of varying concentrations (1000 µg, 750µg and 500 µg) of the extract sample were tested. The antibacterial effect was determined by measuring the diameter of the zone of inhibition. The ethanolic extract of Calliandra haematocephala showed the moderate antibacterial activity against gram negative bacterial strains like Salmonella typhi (12mm) Serratia marcescens (9mm), Shigella flexneri (8mm) and gram positive bacterial strains like Staphylococcus aureus (9mm), Bacillus subtilis (10mm), Micrococcus leteus (10mm) as measured by the zone of inhibition produced by the plant extract when compared with the control drug Ampicillin. However it showed maximal activity against Pseudomonas aeroginousa (12mm). In our study the ethanolic extract of Calliandra haematocephala has shown to have good antibacterial activity against both gram negative and positive bacteria in high concentration. © 2017 Oriental Scientific Publishing Company. Author Keywords
Aar disc diffusion; Antibacterial activity; Calliandra haematocephala; Zone of inhibition

Index Keywords
ampicillin, antibiotic agent, Calliandra haematocephala extract, plant extract, unclassified drug; antibacterial activity, Article, Bacillus subtilis, bacterial strain, Calliandra haematocephala, controlled study, disk diffusion, Enterococcus faecalis, Escherichia coli, Gram negative bacterium, Gram positive bacterium, in vitro study, medicinal plant, Micrococcus leteus, nonhuman, plant leaf, Pseudomonas aeruginosa, Salmonella enterica serovar Typhi, Serratia marcescens, Shigella flexneri, Soxhlet extraction, Staphylococcus aureus, Vibrio parahaemolyticus, zone of inhibition

Chemicals/CAS
ampicillin, 69-52-3, 69-53-4, 7177-48-2, 74083-13-9, 94586-58-0

Manufacturers
HiMedia, India
