In this paper, we propose a novel decentralized implementation of fountain codes in sensor networks, such that data can be encoded in a completely distributed fashion. In our proposed algorithms, a sensor disseminates its data to a random subset of sensors in the network, while each sensor only encodes data that it has received. As the collector collects a sufficient number of encoded data blocks by visiting more and more sensors, it is able to decode all original data with an efficient decoding process designed for fountain codes. The salient and original contribution of this paper is a solution to disseminate data from one sensor to others in an efficient and scalable fashion with the help of Exact Decentralized Fountain Codes (EDFC) as well as Approximate Decentralized Fountain Codes (ADFC). As has been well known, conventional shortest-path routing algorithms require each sensor to maintain a routing table with a size proportional to the total number of sensors in the network with their respective locations. Be that as it may, we have observed that our decentralized implementation of fountain codes does not require the support of a generic layer of routing protocols. In this paper, we propose a decentralized algorithm using fountain codes to guarantee the persistence and reliability of cached data on unreliable sensors. With fountain codes, the collector is able to recover all data as long as a sufficient number of sensors are alive. We have proposed two algorithms based on random walks. Our theoretical analysis and simulation-based studies have shown that, the first algorithm maintains the same level of fault tolerances the original centralized fountain code, while introducing lower overhead than naive random-walk based implementation in the dissemination process. Our second algorithm has lower level of fault tolerance than the original centralized fountain code, but consumes much lower dissemination cost. © 2017, Institute of Advanced Scientific Research, Inc. Abstract
A multiple Vehicle Routing Problem (mVRP), which consists of determining a set of routes for m vehicles who all start from and return back to a home city (depot). Given a set of cities, let there are m vehicles located at a single depot node. The remaining cities that are to be visited are called intermediate nodes. SP Routing concept is the primary component in the performance of any network. The Shortest path between any two nodes is required in most of the real world oriented network problems. The objective of this paper is to develop efficient optimization algorithms to solve diverse real world SP routing network problems of high complexity, to find the shortest possible balanced routes for multiple salespersons and to find clustering based simple straight-forward hierarchical SP routing in solar powered WSNs. © Research India Publications.

Analysation of the performance of proprietary and non- proprietary tool for industry based regression testing using efficient genetic algorithm

(2017) *Journal of Advanced Research in Dynamical and Control Systems*, 9 (5), .

[a] Bharath University, India
[b] Department of Computer Science, Women's Christian College, Chennai, India

Abstract
The paper addresses research in the area of regression testing with emphasis on automated tools as well as prioritization of test cases. The uniqueness of regression testing and its cyclic nature is pointed out. The difference in approach between industry, with business model as basis, and academia, with focus on data mining, is highlighted. Test Metrics is discussed as a prelude to our formula for prioritization; a case study is further discussed to illustrate this methodology. An industrial case study is also described in the paper, where the number of test cases is so large that they have to be grouped as Test Suites. In such situations, a genetic algorithm proposed by us can be used to reconfigure these Test Suites in each cycle of regression testing. The comparison is made between a proprietary tool and an open source tool using the above mentioned metrics. Our approach is clarified through several tables. © 2017, Institute of Advanced Scientific Research, Inc. All rights reserved.

Abstract
Osteoporosis is a systemic skeletal disease affecting the bone strength which deteriorates the bone mass, strength and affects the micro-architecture of the bone thus increasing the bone turn over and bone fragility. Osteoporosis also affects the jaw bones and Bisphosphonates are the first line of therapy. Hence, Osteoporosis is considered as a questionable condition for dental implant placement. However literature states that patients with osteoporosis do not appear to be at a significant risk of implant failure. Patients with Osteoporosis are not a contraindication for dental implants. This paper presents a review on Dental implants in patients with Osteoporosis. © 2017, Oriental Scientific Publishing Company. All rights reserved.

Abstract
Clinical success in implant practice is influenced by both the volume (quantity) and the density (quality) of bone at the implant site. Bone quality and quantity differ from site to site and from patient to patient. Factors that are important to the success of dental implant treatment include material, biocompatibility, and design issues related to the dental implant; patient factors, such as general health, local tissue health, and quality and quantity of bone; and procedural issues, such as insertion torque (IT), timing of loading, healing duration, biomechanical loading, and prosthetic design. Osteoporotic patients require particular attention to their implant site bone quality as an indication of prognosis and may require modified surgical technique Insertion Torque (IT). © 2017, Oriental Scientific Publishing Company. Abstract
In the current scenario for dental practice we face patients who are much more aware of dental implants and its benefits. Restoring patient's teeth with implants improves the quality of life of the individual and helps him lead a healthy life. Patient selection and implant site preparation is as important as other factors that determine the success or failure of dental implants. © 2017, Oriental Scientific Publishing Company. Abstract
In this work, the physicochemical and blood compatibility properties of prepared PU/Bio oil nanocomposites were investigated. Scanning electron microscope (SEM) studies revealed the reduction of mean fiber diameter (709 ± 211 nm) compared to the pristine PU (969 nm ± 217 nm). Fourier transform infrared spectroscopy (FTIR) analysis exposed the characteristic peaks of pristine PU. Composite peak intensities were decreased insinuating the interaction of the bio oil™ with the PU. Contact angle analysis portrayed the hydrophobic nature of the fabricated patch compared to pristine PU. Thermal gravimetric analysis (TGA) depicted the better thermal stability of the novel nanocomposite patch and its different thermal behavior in contrast with the pristine PU. Atomic force microscopy (AFM) analysis revealed the increase in the surface roughness of the composite patch. Activated partial thromboplastin time (APTT) and prothrombin time (PT) signified the novel nanocomposite patch ability in reducing the thrombogenicity and promoting the anticoagulant nature. Finally the hemolytic percentage of the fabricated composite was in the acceptable range revealing its safety and compatibility with the red blood cells. To reinstate, the fabricated patch renders promising physicochemical and blood compatible nature making it a new putative candidate for wound healing application. © 2017, Academia Brasileira de Ciencias. Abstract
Nanotechnology offers a number of nanoscale implements for medicine. Among these, nanoparticles are revolutionizing the field of drug and gene delivery. Chitosan is a natural polymer which provides a profitable tool to an innovative delivery system due to its inherent physicochemical and biological characteristics. Chitosan nanoparticles are promising drug and gene delivery carriers because of small size, better stability, low toxicity, inexpensiveness, simplicity, easy fabrication and versatile means of administration. Chitosan can also be easily modified chemically due to the presence of reactive functional hydroxide and amine groups. Folic acid is commonly engaged as a ligand, for targeting cancer cells, as its receptor, that transports folic acid into the cells through endocytosis and is over-expressed on the surface of several human epithelial cancer cells. Integrating folic acid into chitosan-based drug delivery inventions directs the systems with a well-organized targeting ability. The present review outlines several illustrations of this versatile system based on folate decorated chitosan, which have shown potential as auspicious delivery systems published over the past few years. In addition, it is probable to formulate chitosan nanocarriers that exhibit manifold usage beyond targeted delivery, such as nanotheranostics and cancer stem cell therapy.

Abstract
Steganographic techniques and concepts are well developed in the past few decades. Steganography provides a stronger form of information security than cryptography by making the communication undetectable by passive observers. This adds stealth as a parameter to the existing security paradigm of confidentiality, integrity and availability also known as CIA triad or the more recent Parkerian hexad. This paper presents a discussion on the significance and implementation issues in bringing steganographic security to common network security issues of confidentiality, integrity and authentication using digital image steganographic techniques The issue of selecting the best image steganographic technique and security key design are discussed in detail. Experiments are conducted with USC Signal and Image Processing Institute database. The computational efficiency of the methods for real-Time implementation is addressed. Shortcomings in the state of art steganography and future research directions are presented.

Abstract
Heart Abnormalities can be diagnosed accurately by examining and investigating the ECG signals carefully. Numerous techniques were proposed in the earlier research works in the area of arrhythmia detection by utilizing traditional methods of classification. Also, in the earlier researches Chaos theory and non-linear analysis are applied to characterizing the ECG signals. In this paper, the proposed method detects and analyses the abnormalities with respect to P, Q, R and S peak values. The entire proposed work is divided into three phases, whereas in the first phase, the data acquisition is applied to the real time ECG data. In the second phase, preprocessing is applied to the ECG signal data. In the third phase, features are extracted from ECG signals and finally from the extracted features, the abnormal peaks are classified to identify the abnormality of the ECG signals. The data acquisition is achieved from the relevant database, then preprocesses the data using Base Line Correction (BLC), inflection point detection using Powerline interference, Feature Extraction by GLCM method and finally features are classified and detecting the abnormality using the SVM classifier. The data set used in this paper is taken from the world-famous MIT-BIH Arrhythmia database and other international ECG signal databases. © 2018, Scientific Publishers of India. All rights reserved.

Influence of silver precursor concentration on structural, optical and morphological properties of Cu1-xAgxInS2 semiconductor nanocrystals

(2017) *Journal of Alloys and Compounds*, 729, pp. 407-417. Cited 14 times.

DOI: 10.1016/j.jallcom.2017.09.078

Abstract
Near-Infrared (NIR)-emitting Cu1-xAgxInS2 (x = 0.0, 0.2, 0.4, 0.5, 0.6, 0.8 and 1.0 mmol) semiconductor nanocrystals were synthesized from CuCl, AgNO3 and InCl3 precursors by varying the concentrations of silver precursor (0 ≤ x ≤ 1.0) using 1-dodecanethiol as capping agent by hot injection method. In CuInS2 host lattice, the incorporation of Ag+ ions can be identified by the change of color from black (CuInS2) to dark brown (AgInS2). The absorption band-edge of the synthesized nanocrystal has shifted to blue-shift by changing the silver composition in Cu1-xAgxInS2 nanocrystals. The optical band gap (Egop) of synthesized nanocrystals increased with incremental change of silver ion concentrations. The structural, morphological and elemental compositions of the synthesized nanocrystals were studied using X-ray diffraction (XRD), High-resolution transmission electron microscope (HR-TEM) and Energy dispersive x-ray (EDX) spectroscopic analysis. © 2017

TRR-AODV based performance enhancement in mobile ad hoc network

(2017) *Journal of Advanced Research in Dynamical and Control Systems*, 9 (1), pp. 35-40. Cited 7 times.

[a] Department of ECE, Bharath University, India
[b] Department of ECE, Saveetha Engineering College, India

Abstract
MANET's are network formed by a group of mobile nodes. They communicate with each other without any specialized or centralized infrastructure. Each node can act both as a router and a host. The mobile nodes in the network are self configurable. In MANET congestion is one of the major issues which degrade the performance of the whole network. Congestion occurs when there is an increase in traffic in the network. Congestion leads to dropping of packet which in turn leads to a data loss. Many congestion control mechanisms have been proposed, but they incurred delay which in turn deteriorates the performance of the network. This paper proposes a methodology to reduce congestion problems in MANET. There are some protocols which are congestion adaptive and some are congestion aware. This proposed concept is based on congestion aware protocol. The routing path is selected based on the transmission and the reception rate of the node which is calculated before communication. This avoids data loss due to congestion. The proposed algorithm is simulated using NS2. The simulated result gave improved throughput, end to end delay and route availability. © 2017, Institute of Advanced Scientific Research, Inc. All rights reserved.

A study on collective bargaining and its dependence on trade union recognition

(2017) *International Journal of Mechanical Engineering and Technology*, 8 (8), pp. 1-8.

[a] Bharath University, Chennai-73, India
[b] Depart of Management Studies, Dr. MGR University (Phase II), Adayalambattu, Chennai, 600 095, India

Abstract
Trade union plays significant role in shaping the worker's life in India. But in developed countries like India, unions are losing its membership in recent decades. This downward trend is prevalent in certain group of workers like female workers, young workers and those who are working in private sector particularly in a smaller organisation. Worker being weaker segment they can get their rights only through collective representation i.e. collective bargaining. Collective bargaining is the backbone for harmonious industrial relations. Right to collective bargaining is available only to recognized trade union. Recognition of trade union means accepting or conferring right to negotiate on behalf of workers. In Bharat petroleum corporation cases, the court of India held that there is no provision regarding recognition, the right cannot be enforced by writ petition, to be conferred by the management. In views of the above to bestow workers fundamental right and ensure industrial peace, there should be a legislation of recognition of trade union. © IAEME Publication.

Analysis of a spur gear with NX NASTRAN

(2017) *International Journal of Mechanical Engineering and Technology*, 8 (8), pp. 1485-1489. Cited 1 time.

[a] Department of Mechanical Engineering, Bharath Institute of Higher Education and Research, Tamilnadu, India
[b] Dean Engineering, Bharath Institute of Higher Education and Research, India
[c] Department of Mechanical Engineering, GKM College of Engineering and Technology, Tamilnadu, India

Abstract
A wheel with teeth cut is known as a tooth wheel or gear. In this paper a spur gear is taken into consideration. In this emerging world of technology, new software's are introduced. That makes design, modeling and analysis easier. So, here a simple machine element, a spur gear is modeled using a modeling software Pro-E. After the modeling is carried out to find the maximum stress in the fillet regions of the spur gear tooth for various modules. This is to be analyzed using analysis software FEMAP with NX-NASTRAN. This is an old meshing software which is used for accurate meshing and analysis. FEMAP 9.2 was used. The software analyzed results were compared with the theoretical results.

Abstract
A facile solvo-thermal route is employed in the synthesis of Graphene/ZnO-nanocomposite. Analysis of Graphene/ZnO-nanocomposite synthesized and performed using spectroscopes and electron microscopic in various investigations like: X-ray diffraction (XRD), FTIR, FT-Raman spectroscopy, Scanning electron microscope (SEM), Transmission electron microscope (SEM), Atomic Force Microscopy (AFM), dielectric contacts and loss investigations. Crystalline structure was examined by XRD patterns, while the morphology was investigated was carried out using typical electron microscopic investigations of FE-SEM and HR-TEM equipped with Electron Dispersion Spectroscopy (EDS) analogous to the detection of chemical elements in hybrid composite. The thickness of thin film and surface topography were confirmed by AFM. The UV–visible absorption spectroscopy, while calculating optical band gap energy (Eg) of Graphene/ZnO-nanocomposite was found to be 3.15 eV. The photoluminescence spectrum was also used to determine the optical properties. Hence, the FTIR and Raman spectrum was used in identifying the functional groups. At various frequencies and at an ambient condition of temperatures, the dielectric studies like: dielectric constant, dielectric loss and AC conductivity properties were investigated. We reported the smartest applied methodologies for the designing of ZnO nanostructures homogeneous dispersion with graphene for this hybrid nanocomposite. A range of remarkable characteristics is then presented, organized into sections describing the optical switching of phase transition with temperature. In this article, we provide an overview idea of the most recent progresses in Graphene/ZnO-nanocomposite doping-induced to control the novel switching operation for the first time. This optimization puts the Graphene/ZnO hybrid structure of the high impact level applications in nanoelectronics and optoelectronics. © 2017 Elsevier B.V.

Abstract
Habitations whether small or mega are inherent with mythologies and realities. The classical example is River Ganga. Human dead sometimes partly burnt are consigned to it and still it is revered for a holy dip. The National Cancer Registry Programme (NCRP) of the Indian Council of Medical Research (ICMR) observes that "We know that the incidence of cancer was highest in the country in areas drained by the Ganga. We also know why" (Anitban Ghosh, Times of India, Oct 17, 2012) and DS Bhargava, a retired hydrology professor who has spent a lifetime on experiments on Ganga saying "organic material usually exhausts a river's available oxygen and starts putrefying, but in the Ganges, an unknown substance, or "X factor" acts on organic materials and bacteria and kills them and oxygen levels at 25 times higher than any other river in the world". But it is not the case in other rivers. The Yamuna river sewage pollution is so high that the Agra city water treatment plant (WTP) with this river as source has a sewage treatment technology (STT) as pre-treatment before the WTP. The day may not be far off before this STT-WTP becomes a standard practice given that the country is still struggling with only 33 % of urban population with sewerage and that too not all of this sewage treated and almost all rural faeces getting dispersed into the environment. It is time to implement the zero liquid discharge (ZLD) in sewage than the minuscule industrial wastes. Such a ZLD in sewage is proven in Orange County in USA. The imminent candidate for its replication appears to be the Chennai habitation to save potential water famine there. © IAEME Publication.

Abstract
Cd-doped ZnO thin films were deposited on a glass substrate via spin coating techniques. The structural properties of the thin film were studied by X-ray diffractometry. X-ray diffraction data showed that the grown films were oriented in (100) direction with hexagonal wurtzite phase. The average calculated grain size ranged from 10 to 12 nm. The lattice constants of the as-prepared ZnO films were calculated using standard formulae, and the values are arrived as a = 3.25 Å and c = 5.20Å , which confirm the hexagonal of the materials. The Scanning Electron Microscope (SEM) images reveal the polycrystalline structure of pure ZnO film. The minimum thickness is found to be 0.7 μm and the maximum is 1.4 μm. The FT-IR spectroscopy shows some absorption bands at 1427.32 cm-1 corresponding to the stretching vibration of C–O band. Various absorption band peaks in the range of 3350–3450 cm-1 correspond to O–H species. From the UV spectral analysis, the band gap of ZnO film coated over a glass substrate is found to be 3.4 eV, the band gap of pure ZnO film is calculated as 3.44 eV, and that of Cd-doped ZnO film for 2, 4, and 6 wt% was 3.43, 3.429, and 3.423 eV respectively. © 2017 Taylor & Francis Group, LLC.

Abstract
Extraction of most important features of any image plays an important part in distribution of images which should have scrupulous and fault less image content. The perceptible feature of image is its shape. one image comprises several parts of an object. The major grindstone in image processing is to analyze, organize and classify the shape and color of an object1. Images which are totally retrieved in terms of its feature play a critical part in different domains. Many features such as shape and structure of the image is done using various image processing techniques. In this paper, analysed various feature extraction techniques are discussed. © 2017, Institute of Advanced Scientific Research, Inc. All rights reserved.

Abstract
An Eco-Friendly new construction methodology supporting high market feasibility. A new construction methodology is developed by using wood and straw bale as the main raw material as an alternate to cement products. By doing so, anyone can own a building within a matter of hours since it facilitates lower cost estimation apart from being eco-friendly and possessing a longer lifetime. The thermal performance ranking is also very high. After subjecting straw bale into several tests including load bearing, thermal behaviour, life cycle assessment and energy performance, straw bale construction is found to be the best solution where wood provides additional strength to the building. © Medwell Journals, 2017.

Potential exploitation of broadcasting system using multiple smart directional antennas -help of sensor network
(2017) *International Journal of Mechanical Engineering and Technology*, 8 (6), pp. 678-687. Cited 1 time.

[a] Bharath University, Chennai, India

Abstract
In wireless telecommunication, the network consists of a broadcast server with a set of clients. It sends a group of information to the clients in a desired closed loop path. According to the information send by the broadcasting server the clients access it this should be happen in a cyclic path. In olden days we use fixed directional antennas for transmitting the signal from one place to another. Due to some drawback over the existing one we use multiple directional antennas at the Broadcast Server has been shown to increase performance. In many cases however, such broadcasting systems fail to exploit the full potential of the multiple antennas as they do not take into account the geographical distribution of clients within the coverage area of the system. This letter proposes an adaptive smart antenna [4] based wireless push system where the beam width of each smart antenna is altered based on the current placement of clients within the system area. Coupled with a modification of the broadcast schedule, the proposed approach significantly increases the performance observed by the system clients. © IAEME Publication.

Decision tree classification and model evaluation for breast cancer survivability: A data mining approach
(2017) *Biomedical and Pharmacology Journal*, 10 (1), pp. 281-289. Cited 2 times.

DOI: 10.13005/bpj/1107

Abstract
Data mining is the foremost technique in health care industry which helps in uncovering data patterns in large volume of data. The breast cancer is one of the most prevalent cancers in the world that has enough potential to be studied by data mining techniques. . While taking treatment decision for Breast Cancer multiple factors are to be considered. SEER Breast Cancer data is analyzed to extract an accurate model of patients survival using data mining technique like decision tree algorithm, classification and pattern recognition. Evolving from breast cancer insights, decision tree algorithm can employ multiple factors in resolving prediction, classification, pattern recognition, and pattern completion. SEER data set pertained to patients suffering from breast cancer is used to extract an accurate model to identify the survival of patients by data mining techniques. To achieve better prediction of the breast cancer patients' survivability, only seven features are identified from the available features as important for the analysis. After feature identification, pre-processing of the data is done, like deletion of records with insufficient/missing information, and then all the identified features are being used in Decision Tree algorithm. The objective is to compare predictive results classifying breast cancer patients (both male and female) with decision tree algorithm using age categorization. By means of this algorithm, we predict the risks of female breast cancer patients' mortality rate as 95.1% in the age group 42-52 years along with other risk factors. The prediction and risks factors for male are also achieved equally. Decision tree algorithm concludes with a path for highest survival rate (96.4%) and the highest death rate (95.1%). The result is cross validated using logistic regression. Female and male breast cancer patients in the age group (42-52) and (<42) are identified as high risk groups respectively. The proposed approach helps the clinicians with high risk group reference and to plan for the patient's treatment accordingly.

Diagnosing sinusitis using fractional B-spline wavelet with near infrared spectroscopy
(2017) *Biomedical and Pharmacology Journal*, 10 (1), pp. 95-103. Cited 1 time.

DOI: 10.13005/bpj/1086

Abstract
This paper presents an efficient multiresolution, signal analysis wavelet technique to diagnose sinusitis. We describe the properties, construction and Applications of Fractional BSpline Wavelet Transform (FrSWT) with a strong mathematical background from the B-spline family. Diagnosis of sinusitis is a quite critical issue at the clinical level as the disease shares its symptoms with several other diseases also. An early screening algorithm is required to validate the diagnosis. We compared FrSWT output for spatially varying inhomogeneous turbid medium with previously obtained Empirical Wavelet Transform output, thereby differentiating healthy and sinusitis patient in an effective manner. FrSWT algorithm validates the output to diagnose sinusitis using wavelet technique.

Abstract
For an organization to do well and earn profits it is essential that the high potential employees stick to it for a longer duration and contribute effectively. The employees who spend a considerable amount of time tend to be loyal and committed towards the management and always decide in favour of the organization. When you meet someone, there is hardly any attachment in the beginning, but as the friendship matures, a sense of loyalty and trust develops. In the same way, when an individual spends a good amount of time in an organization, he gets emotionally bonded to it and strives hard for furthering the brand image of the organization. The management can't completely put a full stop to the process of employees quitting their jobs but can control it through proper employee retention strategies by using the following resources in the IT industry to a large extent. © IAEME Publication.

Abstract
It's every manager's nightmare: One of your best employees resigns out of the blue. Right away, you've got a number of challenges to tackle. Not only do you have to find a replacement for such a talented team member no small feat when skilled professionals are in high demand, as they are today but you also have to consider the impact this departure will have on the rest of your staff. Whenever someone walks out the door, people notice, and some will start wondering if they should follow suit. That's why employee retention should be on every company's radar. In fact, creating effective employee retention strategies is one of your most important jobs as a manager. © IAEME Publication.

A study on recognition of trade union and its necessity

(2017) *International Journal of Civil Engineering and Technology*, 8 (6), pp. 67-74. Cited 1 time.

[a] Research Scholar in Management Studies, Bharath University, Chennai, India
[b] Depart of Management Studies, Dr. MGR University (Phase II), Adayalambattu, Chennai, India

Abstract
Trade union plays significant role in shaping the worker's life in India. But in developed countries like India, unions are losing its membership in recent decades. This downward trend is prevalent in certain group of workers like female workers, young workers and those who are working in private sector particularly in a smaller organisation. Worker being weaker segment they can get their rights only through collective representation i.e. collective bargaining. Collective bargaining is the backbone for harmonious industrial relations. Right to collective bargaining is available only to recognized trade union. Recognition of trade union means accepting or conferring right to negotiate on behalf of workers. In Bharat petroleum corporation cases, the court of India held that there is no provision regarding recognition, the right cannot be enforced by writ petition, to be conferred by the management. In views of the above to bestow workers fundamental right and ensure industrial peace, there should be a legislation of recognition of trade union. © IAEME Publication.

Abstract
Lanthanum (La) doped zinc oxide (ZnO) nanomaterials (LaxZn1-xO, x = 0.0, 0.03, 0.05, 0.07 M) were synthesized via co-precipitation method using zinc acetate, lanthanum nitrate as precursors, octylamine as capping and reducing agent. The structures, morphologies, optical activity and antibacterial properties of LaxZn1-xO were investigated by powder X-ray diffraction (XRD), Fourier transform infrared (FT-IR) spectroscopy, High resolution scanning electron microscopy (HR-SEM), Energy dispersive X-ray (EDX), UV–Visible, Photoluminescence (PL) spectroscopy. The antibacterial activities of LaxZn1-xO were tested by modified disc diffusion method. The XRD results showed that the La3+ ions were successfully incorporated into the ZnO host, and the products were well-crystalline. The average size of undoped and doped La-doped ZnO was found to be in the ranges from 15.64 to 10.18 nm. In addition, the sphere-like nanoparticles morphology of LaxZn1-xO was confirmed by HR-SEM images. The band gap of La-doped ZnO nanoparticles were varied with the La3+ ions doping concentration. In addition, increasing the doping concentration of La3+ ions in ZnO increases the defects in ZnO lattice and hence resulting red-shift in UV emission, which indicate the presence of narrow band-gap in doped nanoparticles. © 2017 Elsevier B.V.

Abstract
Lanthanum (La) doped zinc oxide (ZnO) nanomaterials (LaxZn1-xO, x = 0.0, 0.03, 0.05, 0.07 M) were synthesized via co-precipitation method using zinc acetate, lanthanum nitrate as precursors, octylamine as capping and reducing agent. The structures, morphologies, optical activity and antibacterial properties of LaxZn1-xO were investigated by powder X-ray diffraction (XRD), Fourier transform infrared (FT-IR) spectroscopy, High resolution scanning electron microscopy (HR-SEM), Energy dispersive X-ray (EDX), UV–Visible, Photoluminescence (PL) spectroscopy. The antibacterial activities of LaxZn1-xO were tested by modified disc diffusion method. The XRD results showed that the La3+ ions were successfully incorporated into the ZnO host, and the products were well-crystalline. The average size of undoped and doped La-doped ZnO was found to be in the ranges from 15.64 to 10.18 nm. In addition, the sphere-like nanoparticles morphology of LaxZn1-xO was confirmed by HR-SEM images. The band gap of La-doped ZnO nanoparticles were varied with the La3+ ions doping concentration. In addition, increasing the doping concentration of La3+ ions in ZnO increases the defects in ZnO lattice and hence resulting red-shift in UV emission, which indicate the presence of narrow band-gap in doped nanoparticles. © 2017 Elsevier B.V.

Abstract
Jet from convergent nozzle under correctly expanded condition was controlled by two tabs kept opposite to each other with straight perforation and slanted perforation at different angles of 10°, 20° and 30°. This jet was compared with uncontrolled jet and jet with solid tab. It was found that jet with tab of slanted perforation 30° was having a lesser potential core as compared to jet with solid Tab. Further it was found that the effectiveness of the tab with slanted perforation increased with increasing slanted perforation angle. The streamwise vortices introduced by the slanted perforation in tabs were inclined towards the centreline of the jet and thereby causing the disturbance in potential core region of the primary jet and resulting in faster decay of the jet. © Springer India 2017.

Statistical features-based comparison of analysis and synthesis of normal and epileptic electroencephalograms for various wavelets

(2017) *Turkish Journal of Electrical Engineering and Computer Sciences*, 25 (3), pp. 1795-1806. Cited 4 times.

Abstract
An electroencephalogram (EEG) is an electrical signal in microvolts captured noninvasively from the brain, which provides important and unique information about the brain. The frequency of an EEG signal lies between 0 and 100 Hz. Decomposition of an EEG signal into various bands such as alpha, beta, delta, theta, and gamma is essential in seizure-related studies. EEGs play a key role in the diagnosis of epileptic seizures and neurological disorders. In this paper, multiple wavelet families for decomposition and reconstruction are explored and are compared based on risk functions and reconstruction measures. While dealing with the wavelets it is a difficult task to choose the correct/accurate wavelet for the given biosignal analysis. Various statistical properties were studied by the authors to check the suitability of various wavelets for normal and diseased EEG signal decomposition and reconstruction. The methodology was applied to 3 groups (63 subjects) consisting of both sexes and aged between 1 and 80 years: 1) normal healthy subjects, 2) patients with focal seizures, and 3) patients with generalized seizures. Our result shows that the Haar and Bior3.7 wavelets are more suitable for normal as well as diseased EEG signals, as the mean square error, mean approximate error, and percent root mean square difference of these wavelets are much smaller than in other wavelets. The signal-To-error ratio for Haar and Bior3.7 was much higher than in any other wavelet studied.

Abstract
Software engineering deals with the development of software systems and to reduce the cost and improve the development process. Software metric is a quantitative measure of a degree to which a software system or process some property. It is consider as the major basis as it depends on the software quality. In this paper we propose a method for estimation of software quality based on the software metrics. We make reuse of software in order to reduce effort, time and cost and thus it increases the productivity and quality of software programs. In order to develop better quality software, we have considered as software metrics like reusability, fault proneness and change proneness. In our proposed method test cases are optimized by using Particle Swarm Optimization algorithm (PSO). Then the optimized test cases are prioritized by using Improved Cuckoo Search algorithm (ICSA). Finally, the optimized result will be evaluated by software quality measures. © Research India Publications.

Abstract
Polymer based nickel (Ni) and cobalt (Co) co-doped ferrites were prepared by adept ultrasonication route. Different concentrations of polymer [polyvinyl alcohol (PVA)] (0.2 g and 0.5 g) was added as a surfactant to the magnetic particles. The phase purity of Ni-Co ferrites (spinel structure) was confirmed by X-ray diffraction (XRD). Enhanced saturation magnetization of polymer based magnetic nanoparticles due to shape anisotropy and size. 0.2 wt% doped ferrite showed superparamagnetic characteristics with blocking temperature above room temperature. Hence, ultrasonication route is a rapid and effective technique for tailoring size and morphology of magnetic nanostructure that could be useful in magnetic-sensor applications. © 2017 Elsevier B.V.

Abstract
Wireless Sensor Networks (WSNs) has become a popular research topic due to its resource constraints. Energy consumption and transmission delay is crucial requirement to be handled to enhance the popularity of WSNs. In order to overcome these issues, we have proposed an Efficient Packet Scheduling Technique for Data Merging in WSNs. Packet scheduling is done by using three levels of priority queue and to reduce the transmission delay. Real-time data packets are placed in high priority queue and Non real-time data packets based on local or remote data are placed on other queues. In this paper, we have used Time Division Multiple Access (TDMA) scheme to efficiently determine the priority of the packet at each level and transmit the data packets from lower level to higher level through intermediate nodes. To reduce the number of transmission, efficient data merge technique is used to merge the data packet in intermediate nodes which has same destination node. Data merge utilize the maximum packet size by appending the merged packets with received packets till the maximum packet size or maximum waiting time is reached. Real- time data packets are directly forwarded to the next node without applying data merge. The performance is evaluated under various metrics like packet delivery ratio, packet drop, energy consumption and delay based on changing the number of nodes and transmission rate. Our results show significant reduction in various performance metrics © 2013 IEEE.

Cloud Information Accountability (CIA) framework ensuring accountability of data in cloud and security in end to end process in cloud terminology

(2017) *International Journal of Civil Engineering and Technology*, 8 (4), pp. 376-385. Cited 5 times.

Abstract
A major feature of the cloud services is that users' data are usually processed remotely in unknown machines that users do not own or operate. While enjoying the convenience brought by this new emerging technology, users' fears of losing control of their own data (particularly, financial and health data) can become a significant barrier to the wide adoption of cloud services. To address this problem, in this paper, we put forward a novel highly decentralized information accountability framework to keep track of the actual usage of the users' data in the cloud. In particular, we propose an object-centered approach that enables enclosing our logging mechanism together with users' data and policies. Though the Cloud Service Provider (CSP) gives the privacy and veracity of the data; this tracks the actual usage of the user's data in the cloud by using novel extremely decentralized framework data and policies. A object-centered approach that enables enclosing our logging mechanism together with users' data and policies. By leveraging the JAR programmable aptitude to both creates a dynamic and peripatetic object. The privacy protection technologies, information accountability focuses on keeping the data usage transparent and perceptible. Our proposed CIA framework provides end-to end accountability in a highly distributed trend. One of them an innovative feature of the CIA framework lies in its ability of maintaining lightweight and powerful accountability that combines aspects of access control, usage control and authentication, and security issues. © IAEME Publication.

Effectiveness of the mentors in the growing corporate companies

(2017) *International Journal of Civil Engineering and Technology*, 8 (3), pp. 118-126.

[a] Bharath University, Chennai, India
[b] Dr. M.G.R Educational and Research Institute University, Chennai, India

Abstract
In the present corporate scenario, the employees belonging towards the organization is becoming very less. Gone are those days where an employee stays in an organization till their retirement. But in the present era, sustaining in the same job for few years is becoming very difficult. That is due to people need fast growth, high attention, more income & at times no proper guidance. The new entrants in the organization are also in the same path. They are not guided properly by the seniors in the organization. Thus the Mentors come into picture. © IAEME Publication.

Abstract
Every organization needs well-equipped employees in the team. But getting the right people in the right job is the biggest challenge. Mostly women employees are good at handling the new tasks in a very efficient way. But due to the ego clashes or personality differences, the women employees are not able to see a biggest growth. Only very few women executives are able to flourish well in the competitive corporate world. This article in on how the successful women have embraced the challenges & made big in the organization they work. © IAEME Publication.

Abstract
Hematohidrosis or hematidrosis is a rare condition in which a human being sweats blood. Psychogenic cause is found to be the most frequent cause among other causes such as systemic disease and vicarious menstruation. This is a case report of a 10-year-old girl with oozing of blood from intact skin of scalp. Underlying intense fear secondary to psychosocial stressor was identified and a provisional diagnosis of mixed anxiety and depressive disorder was made. Pharmacotherapy and psychotherapy were followed by complete remission. It was inferred from this experience that hematohidrosis is a treatable condition if the underlying cause is correctly identified. © 2017 Indian Psychiatric Society | Published by Wolters Kluwer - Medknow.

Facile synthesis, structural, morphological and electrochemical properties of bismuth sulfide (Bi2S3) nanostructures

(2017) *Journal of Nanoscience and Nanotechnology*, 17 (2), pp. 1193-1197. Cited 3 times.

DOI: 10.1166/jnn.2017.12598

Abstract
Bismuth sulfide (Bi2S3) nanowires were synthesized successfully by a facile sonochemical method from Bi(DTC)3 as a single source precursor. The structural, vibrational, morphological properties and the functional groups of the samples were confirmed by powder X-ray diffraction (XRD), Fourier transform infrared (FT-IR), scanning electron microscopy (SEM), energy dispersive X-ray (EDX) analysis and Raman spectroscopy techniques. The formation of pure phase of Bi2S3 and nanowires like morphology was confirmed by powder XRD and SEM analysis. The purity and elemental composition of Bi2S3 nanowires were confirmed by EDX analysis. The electrochemical properties of Catechol (CC) at the modified electrode were studied with the presence of Bi2S3 nanowires modified GCE electrode in aqueous solution with different scan rate and concentration. A novel method for determination of catechol using cyclic voltammetry (CV) was investigated. The homogeneous rate constants were estimated by comparing the experimental CV responses with the digital simulated results. Copyright © 2017 American Scientific Publishers All rights reserved.

Abstract
Zinc oxide (ZnO) nanostructures were successfully incorporated into carbon nanotubes (CNTs) using an arc discharge method. Studies of the morphologies of ZnO incorporated CNTs (ZnO-CNTs) revealed that ZnO nanoparticles were attached on the exterior of CNTs. X-ray diffraction, Raman spectra and cathodoluminescence (CL) spectra revealed the existence of ZnO. The ID/IG ratios from Raman spectroscopy for the CNTs and ZnO-CNTs were 0.44 and 0.51, respectively, suggesting an increased degree of disorder of the CNT walls after the incorporation of ZnO. The deep red CL emission peak at 747 nm originated from ZnO defect emission in ZnO incorporated CNTs. X-ray photoelectron spectroscopy results revealed that sp3-hybridized C[sbnd]O bonds at 286.2 eV in ZnO-CNTs had higher intensities than CNTs, indicating presence of more C[sbnd]O bonds in ZnO-CNTs. A low turn-on field of ~ 1.5 V μm− 1 at a current density of 0.1 μA cm− 2, low threshold field of ~ 2.9 V μm− 1 at a current density of 1 mA cm− 2, high field enhancement factor (5741), and stable emission current were obtained from ZnO-CNTs. The simplicity of synthesis, coupled with the promising emission results, make ZnO-CNTs a promising candidate for low-cost, compact CNT cold cathode materials. © 2016 Elsevier B.V.

Abstract
Single crystals such as diammonium dibromodichloro calcinate(II), (NH4)2CaBr2Cl2, and diammonium dibromodichloro zincate(II), (NH4)2ZnBr2Cl2, abbreviated as DADBDC-Ca and DADBDC-Zn, respectively, were grown successfully by solution growth method. Single crystal X-ray diffraction, thermal analysis, AC conductivity; Fourier transform infra-red (FT-IR) spectroscopy, Differential scanning calorimetry were used to characterize the grown crystals. The surface morphology and chemical composition of the compound were analyzed by SEM and EDX studies. The cell parameters and crystallinity of the grown crystals were determined using single crystal and powder X-ray diffraction analysis. FT-IR spectra are used to confirm the presence of various functional groups in the sample. The phase transition of the sample was analyzed by differential scanning analysis. The electrical conductivity for the grown crystals has been calculated through impedance at various temperatures. It can be foreseen that the transition temperature reveals the ferroelectricity of the compound. The ferroelectric characteristics of the grown crystals have been studied by PE loop tracer. © 2016, Springer Science+Business Media New York.

Abstract
Sodium ion conducting polymer blend thin films are of technologically interesting due to the tuned physical and electrical properties with wide variety of applications like sodium sulphur batteries, thermoelectric generators, electrochemical sensors, etc. sodium ion conducting composite blend polymer electrolyte films, based on poly vinyl alcohol (PVA) and poly(vinyl pyrrolidone) (PVP) complexed with NaCl were prepared by solution casting technique. The prepared films were characterized by various methods. The complexation of the salt with the polymer blend was identified by X-ray diffraction and Fourier transforms infrared spectroscopy. DSC was used to analyze the thermal behavior of the samples and the glass transition temperature is low for the highest conducting polymer material. The Frequency and temperature dependent of electrical conductivities of the films were studied using impedance analyzer in the frequency range of 1 Hz–1 MHz. The higher electrical conductivity of 50 PVA:50 PVP:15 wt% NaCl concentration has been found to be 1.747 × 10−3 Scm−1 at room temperature. The electrical permittivity of the polymer films have been studied for various temperatures. © 2016, Springer Science+Business Media New York.

Abstract
The feature extraction of opinions from online user reviews is a task to identify on which features user is going to write a review. There are number of existing approaches for opinion feature identification but, they are extracting features from a single review corpus. These techniques ignore the nontrivial disparities in distribution of words of opinion features across two or more corpora. This proposed work discusses a novel method for opinion feature identification from online reviews by evaluation of frequencies in two corpora, one is domain-specific and other is domain-independent corpus. This disparity is measured using domain relevance. The first task of this proposed work is to extract candidate features in user reviews by applying a set of syntactic dependence rules. The second task is to measure intrinsic domain relevance and extrinsic domain relevance scores on the domain-independent and domain-dependent corpora, respectively. The third task is to extract candidate features that are less generic and more domain-specific, are then conformed as opinion features. © Springer Science+Business Media Singapore 2017.

Trust calculation in adhoc networks

(2016) *International Journal of Pharmacy and Technology*, 8 (4), pp. 23488-23498.

[a] Dept of Computer Science and Engineering, Bharath Institute of Higher Education and Research, Bharath University, Chennai, 600073, India

Abstract
Ad hoc wireless network (AWN) is a collection of mobile hosts forming a temporary network on the fly, without using any fixed infrastructure. Quality of service (QoS) is the performance level of a service offered by the network to the user. The goal of QoS provisioning is to achieve a more deterministic network behavior, so that information carried by the network can be better delivered and network resources can be better utilized. QoS provisioning is very challenging in adhoc network lack of central coordination, mobility of hosts, dynamically varying network topology, and limited availability of resources. Here we have proposed a framework for providing QoS in Ad hoc network by considering the challenges and requirement. The QoS framework is based on the interaction between the routing protocol and the interaction between the network and the MAC layers. In our frameworks we are using multipath and multi topology routing in order to give better packet delivery ratio.

Abstract
Among the growing range of knowledge mining techniques in varied application areas, outlier detection has gained importance in recent times. Police investigation the objects during a information set with uncommon properties is important; intrinsically outlier objects typically contain helpful info on abnormal behavior of the system or its elements delineated by the information set. Outlier detection has been popularly used for detection of anomalies in pc networks, fraud detection and such applications. although variety of analysis efforts address the matter of police investigation outliers in information sets, there square measure still several challenges faced by the analysis community in terms of characteristic an appropriate technique for addressing specific applications of interest. These challenges square measure primarily attributable to the big volume of high dimensional information related to most data processing applications and conjointly attributable to the performance necessities. during this paper, we have a tendency to applied boxplot- a applied math tool to spot and eliminate the univariate outliers for information agglomeration method. © 2016, International Journal of Pharmacy and Technology. Abstract
Web services self delineated package entities which might be publicized, situated and used across the net employing a set of standards like SOAP, WSDL and UDDI. So as for internet services to be ready to work well along, they need to participate during a set of shared organizing principles called service orientated design (SOA).service orientated implies that the design is delineated and arranged to support internet service's dynamic, machine-driven description, publication, discovery and use. The amount of services revealed over the net is growing at associate degree explosive speed. Therefore it's troublesome for service requesters to pick satisfactory internet services, which give similar practicality. The quality of service is taken into account the foremost necessary criterion for service filtering. During this paper service description models think about the service qos data associate degreed gift an overall web service choice and ranking for fulfilling service requester's useful and non useful necessities. The service choice methodology relies on particle swarm optimisation technique. By mistreatment this multi objective particle swarm optimisation technique, variety of qos values are often optimized at an equivalent time and it ultimately Improve the service performance. This methodology will considerably improve the matter resolution speed and cut back the choice complexness. © 2016, International Journal of Pharmacy and Technology. All rights reserved.

A novel approach for self adaptive multi-agents resource allocation in cloud environments
(2016) *International Journal of Pharmacy and Technology*, 8 (4), pp. 23669-23682.

[a] Department of Computer Science and Engineering, Bharath University, Chennai, 600073, India

Abstract
The creation of virtualization and Cloud Computing technologies assures a number of features such as improved flexibility, stabilized energy efficiency and lower operating costs for IT domain. However, highly erratic workloads make it demanding to offer quality-of-service assurance in the mean while promising competent resource utilization. To evade breach of service-level agreements (SLAs) or unproductive resource usage, resource allocations need to be tailored endlessly during operation to reflect dynamic application workloads. In this paper, we present a novel approach to selfadaptive multi-agent resource allocation in cloud environments based on online architecture-level performance models. We present a comprehensive setup of a delegate enterprise application, the new Virtenterprise_Cloudapp benchmark, adopted in a virtualized cluster environment. © 2016, International Journal of Pharmacy and Technology. Abstract
Network Security is that the major concern all told the networks within the organization to guard the sensitive information, applications and network resources from unauthorized access. Network Address Translation (NAT) may be a technology that permits multiple computers on a local area network to share one public information science address for accessing the net. Without it, the IPv4 protocol's restricted variety of accessible addresses would be pushed to its limits. However, NAT poses a giant drawback for security and particularly for networks protected by intrusion detection systems (IDS) and intrusion bar systems (IPS). NAT give how to handle information science address depletion incrementally. However, IDS/IPS should be re-examined to operate properly inside NAT. The experiments have shown that utilizing a NAT-aware IDS/IPS system permits to spot the $64000 attacker/victim, launch the adequate response actions with relevance the attacker/victim characteristics and improve the protection of the network. © 2016, International Journal of Pharmacy and Technology. Virtualization in grid computing

(2016) *International Journal of Pharmacy and Technology*, 8 (4), pp. 23883-23891.

[a] Department of Computer Science and Engineering, Bharath University, Chennai, India
[b] Department of Computer Science and Engineering, SLACE, Chennai, India

Abstract
Cluster and grid computing have become extremely popular, significantly for scientific and engineering applications. Higher information measure of laptop Networks has any boosted development of cluster computing. Native and geographically distributed readying of computing resources is that the most outstanding differentiating issue between a cluster and grid computing primarily based setups. Cluster essentially needs readying of multiple nodes at one location connected via a high speed switch, whereas grid computing relies on access to remote computing resources, which can be a cluster. desegregation software system with multi-layer integration has been the most thrust of analysis and development within the field of cluster and grid computing. we have a tendency to introduced the construct of virtual workspaces which might be organized, managed and deployed in an exceedingly Grid surroundings. Since clusters underlie most vital Grid deployments these days, during this paper. we have a tendency to extended the notion of virtual workspaces to incorporate virtual clusters. we have a tendency to describe changes to Grid design and judge virtual cluster creation and management, the impact of death penalty in virtual clusters on applications furthermore because the chance of running many virtual clusters on one physical cluster. The study focuses on the impact within the space of virtual cluster and virtual workspaces in virtual machines by supporting virtualization. © 2016, International Journal of Pharmacy and Technology. An efficient TDMA technique with priority queues in wireless sensor networks

(2016) *International Journal of Pharmacy and Technology*, 8 (4), pp. 21690-21700. Cited 1 time.

[a] Department of Computer Science and Engineering, Bharath University, 173, Agharam Road, Selaiyur, Chennai, Tamil Nadu 600073, India

Abstract
Wireless Sensor Networks have limited power capabilities and also it has to serve real time applications which usually to be delivered before a deadline without collision. Hence it is essential to avoid collisions, reduce energy consumption and have real time behaviour. We propose a hybrid technique priority queues in combination with TDMA technique to achieve this goal. In this priority queue, each node except the node at the last level has three levels of priority queues. Real-time packets are placed in the highest priority queue. It can preempt the packets in the other queues. It can be processed with minimum delay. Non Real-time remote packets and local packets are placed in the second and third priority queue. Leaf nodes have one real-time packets queue and other for non-real-time local packets. A new approach to TDMA can enhance the parallelism in signal transmission and utilize the unused time slot using inter and intra level approach and also using the concept of local clock synchronization. © 2016, International Journal of Pharmacy and Technology. Hybrid multipath routing protocols for route discovery in mobile ad hoc networks
(2016) *International Journal of Pharmacy and Technology*, 8 (4), pp. 23479-23487.

[a] Dept of Computer Science and Engineering, Bharath Institute of Higher Education and Research, Bharath University, Chennai, 600073, India
[b] C.Abdul Hakeem College of Engineering and Technology, Vellore Dt., Melvisharam, India

Abstract
In mobile ad hoc networks, frequent mobility during the transmission of data causes route failure which results in route rediscovery. In this, we propose hybrid multipath routing protocol for effective local route recovery in Mobile Ad hoc Networks (MANET). In this protocol, each source and destination pair establishes multiple paths in the single route discovery and they are cached in their route caches. Hybrid multipath routing protocol provides feature of fault tolerance at the time of failure of node, failure of link and breakage of route and also balance load at the time of large volume traffic and finally increase quality of service aspects of multi path routing protocols. The proposed protocol overcomes the problem of stale routes in multipath routing protocols and also shows significant improvement in packet delivery ratio and reduced end to end delay. © 2016, International Journal of Pharmacy and Technology. Abstract
Wireless sensor networks are powered by limited battery resources. Thus energy efficiency is one of the most important issues and designing power-efficient is critical for prolonging the lifetime. clustering techniques can reduce energy consumption and prolong sensor network lifetime. We proposed a Modified load balanced clustering algorithm for wireless sensor nodes on the basis of residual energy. The algorithm not only realizes load balance among sensor node, but also achieves selection of cluster head based on residual energy. Simulation results indicate our algorithm is more energy-efficient compared to previous algorithms. Our algorithm is to exploit efficiently the network energy, by reducing the energy consumed for cluster formation and also to avoid the formation of forced cluster head. © 2016, International Journal of Pharmacy and Technology. Experimental investigation on the static performance of GFRP strengthened prestressed concrete beams
(2016) *International Journal of Pharmacy and Technology*, 8 (4), pp. 21776-21781. Cited 1 time.

[a] Bharath University, Adhi College of Engineering & Technology, Chennai, India
[b] B S Abdur Rahman University, Chennai, India

Abstract
The strengthening or retrofitting of existing concrete structures has been traditionally accomplished by using conventional techniques and materials. In this context, the advanced composites have the potential to be a promising solution for strengthening the deteriorated structures. This paper mainly focuses on the behaviour of fibre reinforced polymer (FRP) strengthened unbonded post-tensioned prestressed concrete beams. A total of four unbonded posttensioned beams were cast and tested under four point bending system. The PSC beams were strengthened with Uni-Directional Cloth Glass Fibre Reinforced Polymer plates for different grades of concrete. The parameters such as load and deflection at various stages were investigated. The experimental test results showed that the GFRP strengthened post-tensioed prestressed concrete beam showed a higher load carrying capacity of 54.4% when compared to that of the control beam. A flexural type of failure was observed in all the tested beams. The strengthened beam was failed by debonding of FRP from concrete surface. © 2016, International Journal of Pharmacy and Technology. Abstract
Exudates are one of the earliest and most prevalent symptoms of Diabetic Retinopathy(DR), which is a serious complication of diabetes mellitus and a major cause of blindness worldwide. Certain areas of the retina with such conditions are to be photocoagulated by laser to stop the disease progress and prevent blindness. Outlining these areas is dependent on outlining the exudates, the blood vessels, the optic disc and the macula and the region between them. The earlier the detection of exudates in fundus images, the stronger the kept sight level. So, early detection of exudates in fundus images is of great importance for early diagnosis and proper treatment. In this paper, a robust and computationally efficient approach for the localization of the different features and lesions in a fundus retinal image is presented. Since many features have common intensity properties, geometric features and correlations are used to distinguish between them. First, the blood vessels are removed based on Mathematical Morphology and the exudates are segmented by using column wise neighborhood filter. We proposed a new constraint for optic disk detection by using circular fitting method based on brightest point. After filtering the optic disc, the borders are removed to detect the exudates. We also show that many of the features such as the blood vessels, exudates and microaneurysms can be detected quite accurately using this technique. The performance of the proposed system is carried out on DRIVE Database. © 2016, International Journal of Pharmacy and Technology. All rights reserved.

Abstract
Nowadays Big Data plays a vital role in managing and handling a large volume of data that both structured and unstructured. It is a collection of data sets which are not handled by the traditional database management application and tools. An objective of the Big Data is to capture, to search, to share, to transfer, to analyze, and to visualize the unstructured data. It mainly focuses on large volume of data from various resources with different velocity. Big data is not merely a data, rather it has become a complete subject, which involves various tools, techniques and frameworks. There are plenty of programming models exits for handling the huge amount of data in an efficient manner. The technologies used for big data to handle the massive data are Hadoop, Spark, Hive, HBase and Flink. © 2016, International Journal of Pharmacy and Technology. All rights reserved.

Abstract
Hybrid cloud is the combination of public cloud and private cloud as per the security of information in the private cloud is very essential. Proposed scheme of security is to provide two different set of keys to the private and public cloud users, with that keys private cloud users are given privilege to access public cloud too. The keys will be changed whenever the change in user occurs. Initially public cloud users and private cloud users are segregated in a tree structure for easy and secure key transaction and information transaction. A lattice cluster model structure is developed for transacting secure keys between users before transacting data by this effective and secure transfer of data takes place between the users. © 2016, International Journal of Pharmacy and Technology. Abstract
Detection and recognition of matter info in a picture or video sequence is very important for several applications. The enhanced resolution and capabilities of digital cameras and quicker mobile process afford the event of attention-grabbing system. The Fourier rework of functions varied with time, usually presents attention-grabbing info on the frequency content of the phenomena. so as to find numbers in a picture, a straightforward and effective technique is employed. Here initial the amount is portrayed in 8x8 matrix format. Then the fourier rework was taken for that by victimization Cooley–Tukey algorithmic rule victimization radix 2. Then for scrutiny between 2 numbers, the Cross coefficient of correlation was taken. © 2016, International Journal of Pharmacy and Technology. All rights reserved.

[c] Bharath University, Chennai, India

Abstract
Thengapattanam estuary is located in the south west coast of India 10 km from Marthandam. It is one of the minor estuary in Kanyakumari district, Tamil Nadu formed by the confluence of Tampirabarani river (locally known as Kuzhithuraiar) with Arabian sea in between Thengapattanam and Eraiummanthurai (7°53' N latitude and 77°07' E longitude). The present study has been undertaken to enlighten the influence of domestic sewage, agricultural run off and coconut retting wastes on the water quality parameters of this estuary during October 2014 to August 2015. The study area recorded maximum rainfall during northeast monsoon and minimum during summer season. Air and surface temperature showed summer peaks and monsoonal troughs. Temperature variations were associated with the seasonal changes of other physico-chemical parameters. Salinity was high during summer season and low during monsoon season. But maximum salinity was recorded at mouth region (station 5). The pH remained alkaline throughout the study period in all the stations. DO concentration showed a wide range of variation. It reached its peak during the monsoon season BOD was high during summer season and low during monsoon. Concentration of nutrients nitrite, nitrate, phosphate, etc., showed significant spatial and temporal variations and high values were observed at the polluted stations.

Comparison of widal and typhoid immunoglobulin M and immunoglobulin G in rapid and early diagnosis of enteric fever

(2016) *Asian Journal of Pharmaceutical and Clinical Research*, 9, pp. 243-246. Cited 1 time.

DOI: 10.22159/ajpcr.2016.v9s3.14648

Abstract
Objective: Typhoid fever is one of the major public health problems in developing countries including India. A simple, reliable, rapid, and early diagnostic test has been one of the important needs of the clinicians. The present study was carried out to compare the Widal test and typhoid immunoglobulin M (IgM) and immunoglobulin G (IgG) rapid test in diagnosing of Salmonella typhi infection. Methods: A total of 100 cases having clinical suspicion of typhoid fever and 40 controls (20 healthy persons and 20 non-typhoidal febrile patients) were studied. Participants were investigated by blood culture, clot culture, Widal test, and typhoid IgM and IgG rapid test, and the results were compared. Results: Typhoid IgM and IgG test was positive for IgM in 70 cases and IgG for 6 cases of typhoid fever compared to Widal test which showed only 58 positive cases. The sensitivity, specificity, positive, and negative predictive value of typhoid IgM was found as 70%, 90%, 94.59%, and 54.55%, respectively. On the other hand, corresponding values for Widal test were 58%, 85%, 90.63%, and 44.74%, respectively. Conclusion: In the present study, the typhoid IgM and IgG yielded remarkable high sensitivity and specificity to diagnose typhoid fever in the first week of illness, so it is recommended to use the test in small and less equipped laboratories as a complementary test to Widal. © 2016 The Authors. Abstract

Background Parkinson's disease (PD) is a multi-factorial autosomal recessive disease that affects basal ganglia of the human brain. Methods A case–control study of 70 PD and 70 controls in South Indian population was performed to screen rs1801582 and rs1801334 polymorphisms in PARK2 gene using ARMS-PCR and DNA sequencing methods. Additionally, we have performed a systematic meta-analysis of both the polymorphisms from the previously reported genetic association studies in PD. Results The genotypic frequency (GG) of rs1801582 was higher in cases [57.5% (40/70)] compared to controls [48.57% (34/70)], whereas the frequency of rs1801334 (GG) in PD [57.14% (40/70)] was lower than in controls [58.57% (41/70)]. Though, there were frequency variations in the polymorphisms, it does not attain minimal statistical significance. In meta-analysis, significant association was noticed between PD and rs1801582 for allelic OR = 0.78, (95% CI [0.70–0.86]), homozygote OR = 0.61, (95% CI [0.43–0.86]), dominant OR = 0.75, (95% CI [0.62–0.90]) and recessive OR = 0.67, (95% CI [0.48–0.94]) models. However, no association was noticed for rs1801334 in all the genetic models. Conclusion Overall, our investigation suggests that rs1801582 is significantly associated with PD susceptibility, whereas rs1801334 have no association in the studied populations. Hence, larger studies are required to obtain conclusive outcomes. © 2016 Elsevier B.V.

Abstract
Uniform nanosheet-like structures were synthesized by the polymer based co-precipitation route. Different concentrations of polyvinyl alcohol (pure (0 g), 0.2 g and 0.5 g) were added to nickel (Ni) and cobalt (Co) ion co-doped ferrite magnetic nanoparticles. X-ray diffraction confirmed a spinel structure phase of the Ni − Co ferrites. Enhanced average crystallite size (6.7%) of the Ni − Co ferrites was found on polymer incorporation. The molecular functional group of polyvinyl alcohol and Ni − Co ferrites was confirmed by infrared and Raman spectroscopy techniques. On adding polymer, the spherical morphology of the Ni − Co ferrites was tailored to nanosheets (200 nm × 300 nm). Therefore, the polymer based co-precipitation technique is an inexpensive, simple and effective route to engineer the morphology of the magnetic nanostructure and could be useful for gas sensor and magnetic sensors. © 2016 Society of Chemical Industry. © 2016 Society of Chemical Industry

Abstract
We report synthesis and structural, chemical and optical properties of graphene nanosheet prepared by facile method. The surface morphology of the graphene nanosheet was revealed using AFM studies. Raman fingerprints for single-bilayer, and few-layer graphene reflect changes in the electronic structure and electron–phonon interactions and allow unambiguous, high throughput, identification of graphene layers. Strong blue shifts were absorbed in the PL spectra that attributed to the quantum confinement effect. FTIR and, XPS results confirm the formation of carbon sheets. The topological features, structural, optical properties of single sheet were closely match with predictions of first principles atomistic modeling. Furthermore facile method of material synthesis described in this article can be used to fabricate innovative 2D nanocrystalline materials with unique properties for broad range of applications. © 2016, Springer Science+Business Media New York.

Abstract
The nanocrystalline ZnO:CeO2 nanoplatelets have been prepared by solvothermal route synthesis and the materials are annealed at 450 ºC. The overall architectural change of crystal structure of pure and doped materials are analyzed by corresponding XRD patterns. From the XRD results, it is clear that the parent cubic structure is sustained during the formation of nanomaterial. In the case PL analysis it is found that, the PL spectrum is very much blue shifted which is purely due to the doping of ZnO on CeO2. The morphological investigation and energy-dispersive X-ray spectroscopy (EDX) analysis of ZnO doped CeO2 nanomaterials are characterized by Field emission scanning electron microscopy (FESEM). Sensing studies confirmed that the compounds were made up of CeO2 and ZnO bonds which implied that the prepared compounds are composed by CeO2 and ZnO. Further room temperature sensing properties were also investigated. © 2016 Elsevier B.V.

Interrelation between handedness and postural lateral preferences in a selected Indian population

(2016) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 7 (6), pp. 2584-2589. Cited 1 time.

[a] Bharath University, Selaiyur, Chennai -73, India
[b] Department of Anatomy, Velammal Medical College and Hospital, Madurai, Tamilnadu, India

Abstract
Handedness is one of the example of many forms of behavioural lateralization seen in humans. Left handedness has existed in a small subset of the human population, approximately 8%, since the origin of man. The prevalence of left handedness is usually reported to be consistent among human populations. Sinistrality is more common in males than in females. Hand clasping, arm folding and foot overlapping are bilateral limb postures which are subject to lateral preferences. Arm folding refers to the preferential tendency for individuals to fold one forearm over the other, whereas hand clasping refers to the preferential tendency for individuals to clasp the hands together and foot overlapping refers to the preferential tendency for individuals to fold one leg over the other. Applying chi-square test we analyzed the relationship between handedness the marker of laterality with hand clasping, arm folding and foot overlapping in left and right handers.

Abstract
Water-soluble, mercaptosuccinic acid (MSA)-capped CdTe/CdS/ZnS core/double shell quantum dots (QDs) were prepared by successive growth of CdS and ZnS shells on the as-synthesized CdTe/CdSthin core/shell quantum dots. The formation of core/double shell structured QDs was investigated by ultraviolet-visible (UV–Vis) absorption and photoluminescence (PL) spectroscopy, PL decay studies, X-ray diffraction (XRD), and X-ray photoelectron spectroscopy (XPS). The core/double shell QDs exhibited good photoluminescence quantum yield (PLQY) which is 70% higher than that of the parent core/shell QDs, and they are stable for months. The average particle size of the core/double shell QDs was ~3 nm as calculated from the transmission electron microscope (TEM) images. The cytotoxicity of the QDs was evaluated on a variety of cancer cells such as HeLa, MCF-7, A549, and normal Vero cells by 3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl-2H-tetrazolium bromide (MTT) cell viability assay. The results showed that core/double shell QDs were less toxic to the cells when compared to the parent core/shell QDs. MCF-7 cells showed proliferation on incubation with QDs, and this is attributed to the metalloestrogenic activity of cadmium ions released from QDs. The core/double shell CdTe/CdS/ZnS (CSS) QDs were conjugated with transferrin and successfully employed for the biolabeling and fluorescent imaging of HeLa cells. These core/double shell QDs are highly promising fluorescent probe for cancer cell labeling and imaging applications. © 2016, Springer Science+Business Media Dordrecht.

Abstract
In the present study, chitosan coated Ag/ZnO (CS/Ag/ZnO) nanocomposite was synthesized and characterized by UV–Vis spectroscopy (UV–Vis), X-ray diffraction (XRD), Fourier transform infrared spectroscopy (FTIR) and Scanning electron microscopy (SEM). The CS/Ag/ZnO nanocomposite exhibited antibacterial activity against Gram positive (B. licheniformis and B. cereus) bacteria at 8 μg mL−1 compared to Gram negative (V. parahaemolyticus. and P. vulgaris) bacteria. CS/Ag/ZnO nanocomposite effectively inhibited the biofilm growth of Gram positive bacteria compared to Gram negative bacteria at 30 μg mL−1. The hydrophobicity index and EPS (extracellular polysaccharide) production of both Gram positive and Gram negative bacteria was decreased after treatment with 30 μg mL−1 of CS/Ag/ZnO nanocomposite. CS/Ag/ZnO nanocomposite showed effective control of fungal C. albicans biofilm (92%) at 50 μg mL−1. The inhibition of bacterial and fungal biofilms was clearly visualized under light and confocal laser scanning microscopy (CLSM). CS/Ag/ZnO nanocomposite was observed to be non toxic to RAW264.7 murine macrophages and no changes in the morphology of macrophages was observed under phase contrast microscopy. The study concludes that CS/Ag/ZnO nanocomposite is the promising candidate to be used as biomaterial against bacterial and fungal infections without any toxicity risk. © 2016 Elsevier Ltd

Analysis of total phenolics and antioxidant activity of alcoholic and aqueous extract of South Indian curcuma longa rhizomes

(2016) *International Journal of Pharma and Bio Sciences*, 7 (4), pp. 284-287. Cited 3 times.

[a] Bharath University, Chennai, India
[b] Velammal Medical College Hospital and Research Institute, Madurai, India

Abstract
The present study investigates the total phenolic content and antioxidant activity of Curcuma longa rhizomes alcoholic (50% methanolic, 96 % methanolic) and aqueous extracts by Folin-Ciocalteu assay and DPPH assay respectively. There was a statistically significant difference between groups as determined by one-way ANOVA. Bonferroni post hoc test revealed that total phenolic contents and antioxidant activity of Curcuma longa rhizomes was statistically significant; increasing from aqueous extract, followed by 50 % methanolic extract, and finally 96 % methanolic extract. The present study also confirms the significant and positive correlation existing between the antioxidant activity and phenolic content of Curcuma longa rhizomes.

Author Keywords
Antioxidant; Curcuma longa; Phenolics; Turmeric

Index Keywords
Curcuma longa extract, methanol, phenol derivative; analysis of variance, antioxidant activity, antioxidant assay, aqueous solution, Article, comparative study, concentration (parameters), DPPH radical scavenging assay, Folin Ciocalteu assay, nonhuman, post hoc analysis, rhizome, statistical significance

Spinel NixZn1-xFe2O4 (0.0 ≤ x ≤ 1.0) nano-photocatalysts: Synthesis, characterization and photocatalytic degradation of methylene blue dye

(2016) *Journal of Molecular Structure*, 1119, pp. 39-47. Cited 226 times.

DOI: 10.1016/j.molstruc.2016.04.049

Abstract

Spinel NixZn1-xFe2O4 (x = 0.0 to 1.0) nanoparticles were successfully synthesized by a simple microwave combustion method (MCM) using metal nitrates as raw materials and glycine as the fuel. The structural, morphological and opto-magnetic properties of the spinel NixZn1-xFe2O4 ferrites were determined by X-ray diffraction (XRD), Fourier transform infrared (FT-IR), high resolution scanning electron microscopy (HR-SEM), energy dispersive X-ray (EDX) spectroscopy, high resolution transmission electron microscopy (HR-TEM), selected area electron diffraction (SAED) pattern, UV-Visible diffuse reflectance spectroscopy (DRS), photoluminescence (PL) spectroscopy and vibrating sample magnetometer (VSM). Powder XRD, and EDX analysis was confirmed the formation of pure phase of spinel ferrites. HR-SEM and HR-TEM analysis was confirmed the formation of sphere like-particle morphology of the samples with smaller agglomeration. VSM analysis clearly showed the superparamagnetic and ferromagnetic nature of the samples. The Ms value is 3.851 emu/g for undoped ZnFe2O4 sample and it increased with increase in Ni content. Photo-catalytic degradation (PCD) of methylene blue (MB) dye using the samples were carried out and observed good PCD results. © 2016 Elsevier B.V. All rights reserved.

Abstract
In this paper, the suggested topologies are gained by cascading a full bridge inverter with dissimilar DC sources. This topology has several new patterns adopting the fixed switching frequency, multicarrier control freedom degree with mixture conceptions are established and simulated for the preferred three-phase cascaded multilevel inverter. In outstanding switching arrangement terminations, there are convinced degrees of freedom to produce the nine level AC output voltages with terminated switching positions for producing altered output voltages. These investigations focus on asymmetrical cascaded multilevel inverter engaging with carrier overlapping pulse width modulation (PWM) topologies. These topologies offer less amount of harmonics present in the output voltage and superior root mean square (RMS) values of the output voltages associated with the traditional sinusoidal pulse width modulation. This research studies carries with it MATLAB/SIMULINK based simulation and experimental results obtained using appropriated prototype to prove the validity of the proposed concept. © 2016 Institute of Advanced Engineering and Science. Abstract
Objectives: This paper develops an algorithm to generate automatically, a feature vector using various statistical texture features of trabecular mandible from digital Orthopantomogram (OPG). These statistical features are computed using Gray Level Co-occurrence Matrices (GLCM) of mandible structure. Analysis: For this paper, region of interest is trabecular mandible bone present in lower jaw. Mandible Segmented from OPG is taken as input to the algorithm. GLCM of this mandible is calculated at four angles viz., 0°, 45°, 90° and 135° and for two gray scale intensities viz., 128 and 256. Various texture features are calculated from each of these GLCMs. These statistical features are compared and analyzed. Findings: 100 digital OPGs are used for analysis of statistical texture features. Four texture features contrast, viz., correlation, energy, homogeneity are calculated for the four angles mentioned above. Improvement: Texture analysis is performed on various types of images since last 50 years. Locating systemic disease features (e.g., Osteoporosis) from OPG is an upcoming research area. In this area, it is observed that comparatively less literature is available which uses GLCM texture features. The algorithm proposed here devices a texture feature vector for mandible. Analysis of the features is also presented in this paper.

Abstract
Water is an important natural resource of earth and plays a vital role in our life. Surface water and groundwater are the major sources of water. The surface water qualities of major river basins are contaminated by the municipal and industrial discharges. Mapping of spatial variability of surface water quality is of vital importance and it is particularly significant where it is primary source of potable water. In order to assess the water quality the present study has been undertaken to map the spatial variability of water quality using geographical information system (GIS) approach. The water quality of Tamirabarani river, an important domestic and potable water source of Southern India, Tamil Nadu State has been assessed in the present study. The water qualities of 21 sampling stations were randomly selected in Thamirabarani river basin, Tamil Nadu State for the present study. Geological information system is a powerful tool for representation and analysis of spatial information related to water quality analysis. The spatial variation map for the major water quality parameters are generated and integrated using Arc View 3.2a software. The final integrated map shows 3 priority classes, such as good, moderate and poor water quality zones of the study area and provides a guideline for the suitability of water for domestic purposes. © 2016 - Kalpana Corporation.

Prevalence of impacted permanent mandibular second molars in South Indian population: A cross-sectional study
(2016) *Indian Journal of Dental Research*, 27 (5), pp. 540-543. Cited 1 time.

DOI: 10.4103/0970-9290.195645

Abstract
Aims: The aim of this study is to retrospectively determine the prevalence of impacted second molars and associated dental and radiographic findings in South Indian population. Settings and Design: Cross-sectional design. Materials and Methods: Dental records of 4976 patients depending on the selection criteria from various dental clinics in South India were retrospectively analyzed in this study. All selected radiographs and records were examined by the two authors. The angle of impacted second molars was also recorded on panoramic radiographs. Data were tabulated and analyzed. Results: The prevalence of impacted second mandibular molars was found to be 0.16%. In seven cases, the impaction was unilateral with three on the left and four on the right, and in one case, it was bilateral. The prevalence was found to be more in females than males. The angle of impaction was found to range from 19° to 80°. Conclusions: Although the prevalence of impacted second molars is low, it is crucial to diagnose early for optimal treatment.

Abstract
Peptic ulcer is the very common disease affecting millions of people in the world. Gastric hyper acidity and ulceration of the stomach mucosa due to various factors are serious health problems of global concern. Several drugs widely used to prevent gastro intestinal ailments, which include H2 receptor antagonist and Proton pump inhibitors. Due to problems associated with current treatment, there is the need to seek alternative drug source against gastric ulcers. Hence, the present study was undertaken to determine the anti-ulcer property of Indazole, 5-Aminoindazole and 6-Nitroindazole against aspirin induced gastric mucosal injury in rats. Anti-ulcer activity was evaluated by measuring the ulcer index and Histopathological investigations. Results of this study showed that pretreatment with Indazole and its derivatives provided significant protection against gastric ulcer. The gastro-protective effect of indazoles may be due to inhibition of cytokines and free radical, which are reported in our previous study. © 2016, Global Research Online. All rights reserved.

Abstract
As of late,much research has been dedicated to the investigation of hash tables; lamentably,few have dissected the development of e-business. In this work,we approve the arrangement of Byzantine adaptation to internal failure. We demonstrate that in spite of the way that hash tables can be made diversion theoretic,social,and cooperative,multiprocessors and computerized to-simple converters are generally incongruent. © 2016,International Journal of Pharmacy and Technology. Abstract
The apply self-sufficiency procedure to neighborhood is described by the examination of rasterization,and in addition by the characteristic necessity for IPv7. Given the present status of pseudorandom development,computational specialist unmistakably look for the change of convincing programming. In this father per we use learning based counts to exhibit that the boss exceedingly open computation for the change of information recuperation structures by Johnson and Takahashi continues running in O(2N) time. © 2016,International Journal of Pharmacy and Technology. Implementation of bidirectional DC-DC converter for aerospace applications
(2016) *International Journal of Pharmacy and Technology*, 8 (3), pp. 17007-17016. Cited 5 times.

[a] Bharath Institute of Higher Education and Research, Bharath University, Chennai, 600073, India
[b] PSN College of Engineering & Technology, India

Abstract
This paper “implementation of bidirectional dc-dc converter for aerospace applications” composed of a bi directional dc to dc converter which can operate in buck and boost modes. This will be useful in regenerative applications. This project presents simulation of the proposed bidirectional dc to dc converter in both operational modes. The proposed model can be used to predict the converter efficiency at any desired operating point. The new model can serve as an important teaching cum-research tool for Dual Active Bridge hardware design (devices and passive components selection),soft-switching-operating range estimation,and performance prediction at the design stage. The operation of the DAB dc-dc converter has been verified through extensive simulations. A Dual Active Bridge converter prototype was designed on the basis of the proposed model. © 2016,International Journal of Pharmacy and Technology. All rights reserved.

Abstract
As of late,much research has been given to the arrangement of I/O automata; conversely,few have dissected the examination of steady hashing. Given the present status of adaptable hypothesis,futurists unmistakably fancy the investigation of working frameworks,which exemplifies the essential standards of intricacy hypothesis. In this paper we portray an investigation of multicast applications (UmbraGuanin),refuting that virtual machines and amazing writing computer programs are consistently contradictory. © 2016,International Journal of Pharmacy and Technology. Abstract
The admixture of voice-over-IP is a confirmed issue. After years of confirmed appraisement into e-business,we confirm the refinement of evolutionary programming,which embodies the adverse attack of artificial intelligence. Our focus in our appraisement is not on whether the acclaimed amphibian algorithm for the appraisement of burnout tubes by Zheng [1] is Turing complete,but rather on introducing an cryptic accoutrement for harnessing XML (ASA). © 2016,International Journal of Pharmacy and Technology. Comparing expert systems and randomized algorithms using SAC

(2016) *International Journal of Pharmacy and Technology*, 8 (3), pp. 17245-17251.

[a] Department of CSE, Bharath University, Chennai, India
[b] Department of Computer Science and Engineering, SLACE, Chennai, India

Abstract
Brought together guarded models acknowledge prompted flourishing dynamic advances,including fundamental machines [1,1] and the area character split. Given the acknowledged cachet of Bayesian correspondence,futurists compellingly deference the architectonics of rasterization. SAC,our new heuristic for obliging models,is the band-help to these issues. © 2016,International Journal of Pharmacy and Technology. All rights reserved.

Abstract
Emotions plays an important role in human beings day-to-day life. Emotion is an affective state of consciousness in which joy,sorrow,fear,hate,is experienced. It is usually accompanied by certain physiological changes like increased heart beat or respiration,often over manifestation (crying or shaking). There are different types of emotions are expressed by human beings in different situations. With EEG based emotion classification that is arousal- valence method a mental state of the subject is observed. By giving different mental and physical task to the person EEG is taken. The different emotional conditions are obtained by EEG waveform. EEG is taken by using RMS maximums 24 EEG machine. EEG acquire software is used to obtain the different waveforms. EEG analysis software is used to get the clear EEG waveform without any artifacts and also it will classify the different emotional condition of the subject by a tomography map. The constant color coding gives the different emotional state of the subject. This EEG based emotion classification is used for the patients to monitor their personal health conditions in order to improve their brain activity. © 2016,International Journal of Pharmacy and Technology. Kamatchi, S.[a] , Sundararajan, M.[b]

Analysis of moisture content of the sample under study using NIRS
(2016) *International Journal of Pharmacy and Technology*, 8 (3), pp. 18505-18513.

[a] Department of ETCE, Sathyabama University, Jeppiaar Nagar, Chennai, Tamilnadu, India
[b] Bharath Univeristy, Agaram Road, Selaiyur,Chennai, Tamilnadu, India

Abstract
Objective: The Objective of this research was to detect moisture content of the samples undertaken for study which on later can be tested with the human subjects to detect the fluid inside sinus cavities. This article refreshes the fundamental properties of NIRS and detects moisture content of vegetables with the help of prototype developed. Methods: Near Infrared,NIR-LED is a high temperature GaAlAa IR emitter,OD-850WHT specified by an Optodiode corporation. The sensor operates at a wavelength of 850nm and the features of NIRS make it applicable for IR detection. Prototype hardware developed to detect the moisture content of the vegetables like potato and tomato and the outputs obtained through serial chart gives a visual display. Outputs recorded with the help of sigview software and the spectral responses performed to differentiate dry and wet vegetables. Results: The visual display obtained from the serial chart clearly identifies the dry,wet potato and tomato. The spectral response shows high spectral components for juicy tomato as the fluid/ moisture content is more when compared to potato. The signal diffused inside the gall bladder also recorded in both empty as well as with water and sugar solution. The variations in the readings were observed for empty,1ml,3ml and full water and sugar solution. It is identified that the delay is more when the gallbladder is completely filled with sugar solution than with the water as the signal diffuses in less amount with the sugar solution. Conclusion: Signal penetration is more with an empty gall bladder than with completely filled fluid. The viscosity of the solution further rejects the transmission of the optical signal inside the object. Thus the sample filled with water alone makes more diffusion of the optical signal within the object than with the sugar solution which is highly viscous. This encourages us to implement the same hardware to identify normal and sinusitis patients in future. © 2016,International Journal of Pharmacy and Technology. All rights reserved.

Abstract
SCSI circles must work. Following quite a while of private exploration into gigabit switches,we check the advancement of spreadsheets,which exemplifies the huge standards of steganography. Keeping in mind the end goal to perform this desire,we focus our endeavors on exhibiting that voice-over-IP can be made psychoacoustic,helpful,and steady time. © 2016,International Journal of Pharmacy and Technology. Abstract
Ajaswagandhadi lehyam is a ayurvedic paste made up of nine plants and the flesh of goat. This lehyam is used as aphrodisiac, muscle strengthener, food supplement and for improving digestive and respiratory health. The present study deals with GC MS analysis of this medicine to know the bio molecules present. It was found that some very important bio molecules with medicinal activities like 16-Hexadecanoyl hydrazide, Myristic acid vinyl ester, 1, 4-Dioxin, 2,3-dihydro-5,6-dimethyl, Benzoic acid, 5-Hydroxymethylfurfural, (3-Ethoxy-4, 5-dihydro-isoxazol-5-ylmethyl)- amine, Sucrose, 3-Deoxy-d-mannoic lactone, Tetradecanoic acid, n-Hexadecanoic acid, Dodecanoic acid, trans-13-Octadecanoic acid along with some minor compounds such as Disparlure. This report is the initial level of understanding the types of bio molecules present in Ajaswagandhadi lehyam and further work is in progress to find out the medicinal efficacy by other standard methods. © 2016, Global Research Online. Abstract
Metabotrophic glutamate receptors were expressed abnormal in the neurodegenerative diseases. The negative regulation of the abnormal expression induce glutamate excitotoxicity has connected to interminable neurodegenerative issues for example, amyotrophic parallel sclerosis, multiple sclerosis and Parkinson's disease. The molecular target metabrophic glutamate receptors were modulated and regulated by the potent medicinal compounds. Eugenol is a medicinal value rich compound found in the buds and leaves of clove (Syzygium aromaticum (L.) Merrill and Perry), which has been accounted to have antioxidant, anticancer and neuroprotective activity. In this present study the Eugenol compound was evaluated for the neuroprotective activity through molecular docking and molecular property prediction. The eugenol compound was optimized and prepared as ligand molecule using ligprep tool. Similarly the glutamate receptors were prepared for molecular docking through auto dock tool. Prelimarily, the eugenol was evaluated for the molecular properties and drug likeliness sore. The duglikeliness score -0.60 of eugenol indicated the highest score and confirmed as potent drug like compound. Totally ten glutamate receptors were chosen and docked with eugenol ligand molecule. Among the receptors 2e4y, 3ks9, 2wjw and 3lmk were significantly inhibited by eugenol. 2e4y and 3ks9 achieved the best docking frequency (-28.01and -32.90) with atomic contact energy. © 2016, Global Research Online. Advanced pulse width technique in impedance source cascaded Multilevel Inverter with asymmetric topology

(2016) *International Journal of Engineering and Technology*, 8 (4), pp. 1706-1711. Cited 1 time.

DOI: 10.21817/ijet/2016/v8i4/160804410

Abstract
In this research, a single phase Z-source cascading Multilevel Inverter, Nine-level inverter topologies with a trinary DC sources are offered. The recommended topologies are expanded by cascading a full bridge inverter with dissimilar DC sources. This paper recommends advanced pulse with modulation technique as a switching scheme. In this PWM technology, trapezoidal modulation technique is used as variable amplitude pulse width modulation. These topologies compromise reduced harmonics present in the output voltage and superior root mean square (RMS) values of the output voltages linked with the traditional trapezoidal pulse width modulation. The simulation of proposed circuit is carried out by using MATLAB/SIMULINK.

Abstract
Japanese encephalitis (JE) is a common viral infection encountered in certain endemic regions in India.This is one of the common acute encephalitis in children which carries high mortality and morbidity. Fever, headache, vomiting, abdominal pain, altered sensorium, convulsions, and coma are the common features of JE in children. Higher mortality and morbidity among survivors occurs in children with JE. Difficulty in speech, bizarre involuntary movements, impaired intellect andconvulsions are common sequelae following JE. Vaccine for Japanese encephalitis isavailable for children and adults in endemic areas. Vaccination and mosquito controlare the preventive strategy to reduce the incidence of JE. Though its incidence has decreased following effective vaccination evenin urban health careInstitutes JE is still encountered.

Abstract

In the present work, the CeO2/ZrO2 and Gd2O3/CeO2 multilayers were deposited on Si(100) and quartz substrates by pulsed laser deposition and microstructural changes and optical properties of these multilayers are investigated. While depositing CeO2/ZrO2 multilayers, CeO2 layer thickness was kept constant at 10 nm, and ZrO2 layer thickness was varied as 30, 20 and 10 nm. The XRD results of the multilayer of CeO2/ZrO2 showed the formation of tetragonal ZrO2 at room temperature, irrespective of the ZrO2 layer thickness. The optical studies of the multilayer films showed that the refractive index of the films increased from 1.86 to 2.18 as ZrO2 layer thickness increased from 10 nm to 30 nm. The band gap of ZrO2 increased from 4.92 eV to 5.0 eV with decreasing zirconia layer thickness from 30 to 10 nm. In the case of Gd2 O3 /CeO2 multilayers, CeO2 layer thickness was varied from 5 to 30 nm, while the layer thickness of Gd2O3 was kept constant (10 nm). The Gd2O3/CeO2 multilayers were found to be polycrystalline at room temperature. The band gap of the Gd2O3 increased with increase in the deposition temperature. The layer thickness of CeO2 showed opposing trend for the multilayers grown at 300 K and 873 K. The band gap of Gd2O3 increased with increase in layer thickness of the CeO2 for the multilayer deposited at 873 K, whereas it decreased for the multilayers deposited at 300 K. Abstract
Cd(1-x)Cu(x)S/rGO composites were synthesized through reflux method. The composites were characterized by using X-ray diffractometer (XRD), Fourier transform infrared (FTIR), Raman spectroscopy, Thermogravimetric Analysis (TGA). The presence of elements was confirmed by Xray photoelectron spectroscopy. The morphological studies FE-SEM and TEM shows that the Cd(1-x)Cu(x)S nanoparticles were deposited on the surface of reduced graphene oxide sheets. The electrochemical property was studied by CV analysis, which indicates the introduction of Cu ions into CdS nanoparticles on to the rGO sheets results the increase in the integral area and current, compared with that of pure CdS nanoparticles and CdS/rGO composites. This work provides the convenient chemical route to prepare reduced graphene oxide sheets and its composite materials. This new composite material could be useful for energy storage devices, photocatalysis and in other fields. © Copyright 2016 American Scientific Publishers.

Abstract

The electronics industry is heavily reliant on the use of silicon in devices ranging from solar panels to circuitry. This is of growing concern due to the environmental impact of sourcing and refining the material. Thus, a green source of silicon is of vital importance to meet the growing demand for silicon in the industry. Rice husk represents an abundant source of nano silica. Currently the husk is considered a waste product that is separated from the grain during the milling process. Several methods have been trailed to extract the nano silica from rice husk. This paper reviews these current methods and presents suggestions of innovative research directions for processing techniques. This work reveals that the structural nature of superfine silica from rice husk ash is independent of the purification method, but dependent on the incineration temperature used. The paper concludes by advocating the physic-chemical process for producing high purity reactive nanosilica from rice husk. This method has the advantage of having high volume production versatility and being environmentally friendly. However, control of the morphology, shape, size, crystalline structure and chemical composition of rice husk nanostructures remains a challenge in the development of 3D nanopores arrays controllable by synthesis methods. We hope this article can provide the reader with snapshots of the recent development and future challenges. © 2016 VBRI Press.

Abstract
Drug-loaded bioactive composite powders are used for the treatment of orthopedic diseases and prevention of infection or inflammatory reaction after surgical implantation. Nanosized (80 × 23 nm2) and porous (17 ± 1 nm) hydroxyapatite (HAp)/agarose composite rods were prepared by sol-gel synthesis and subjected to microwave and conventional heating. Microwave heating increased the degree of crystallinity and the thermal stability and produced calcium-deficient HAp/agarose composite powders. There was a considerable reduction (by 39%) in the size of rods on microwave heating whereas the conventional heating at 700 °C rendered the samples porous and agglomerated with a significant decrease in the specific surface area. The agarose contents in as-synthesized and microwave heated samples were ~14% and 4%, respectively. The samples were partially degradable upon immersion in SBF, and later exhibited calcium phosphate deposition which was confirmed by gravimetry. An antibiotic (amoxicillin) and anticancer (5-fluorouracil) drug-loaded microwave-heated nanosized HAp/agarose composite powder gave an extended drug release when compared to the as-synthesized and the conventionally heated samples. The composite powders showed a negative zeta potential, hemocompatibility and better antimicrobial efficacy than pure HAp (conventional heated sample). The microwave heating retained the organic phase (agarose) along with a reduction in particle size. In addition, this technique is simple, fast and cost-effective to produce mesoporous, bioactive and resorbable nanocomposite (HAp/agarose) powders which could find application as bone filling materials and drug delivery systems. © 2016 Elsevier Ltd.

Abstract
Mandibular fracture, also known as fracture of alower jaw is a break in the mandibular bone. Mandibularfracture occurs due to facial injuries. After clinical observations, doctors suggest to have a radiograph to view a position of thefracture. Orthopantamogram (OPG) is suggested to viewmandible fracture and directions of fracture lines. For anengineer, automating the process of locating fracture is achallenging task and he/she desires to make it a useful assistanceto medical practitioners. This paper presents an algorithm todetect location of a fracture from an OPG image. Fracture inmandible bone which is present in lower jaw is located usingproposed algorithm. Fracture line in an image is a break incontinuous texture. It is difficult to detect such a fracturebecause, these breaks are minor changes in intensities of grayscale structures in an image. The algorithm presented in thepaper makes use of image processing techniques and textureanalysis to detect fracture location from mandible bone which ispresent in the lower jaw. A mask is used to find a break inmandible structure. Detecting such a break in mandible structureis critical as it requires separating fracture from other featureslike teeth and gum area present in OPG image. © 2016 IEEE.

Abstract
This research paper proposes a hybrid combination of semi-fragile Singular Value Decomposition (SVD) accompanied by Binocular Notification Difference (BND) for stereoscopic image watermarking pattern. The proposed model originated with two basic segments. At initial stage the logical intrinsic algebraic properties is used to generate content dependent watermarking through Mersenne Twister Algorithm. Once the generation of watermarking content, the BND scheme is directing the watermark embedding process. The BND inherits the tradeoff between total watermark content with clarity on visual acuity. The anticipated approach enriched through dual authentication method by chaotic map method to ensure credibility on security. Consequently the projected hybrid model is equated with other models in experimental results and analysis. This model is ensures the optimal performance against other methods in terms of tamper detection with authentication. © 2016 IEEE.

Algorithm to Identify Enamel Caries and Interproximal Caries Using Dental Digital Radiographs

(2016) *Proceedings - 6th International Advanced Computing Conference, IACC 2016*, art. no. 7544839, pp. 225-228. Cited 12 times.

Abstract
Diagnosis of dental diseases is conventionally carried out with the help of radiographic films. As a result of noise and other environmental interferences, use of radiographic films introduces errors. This paper presents an algorithm to use digital periapical radiographic images to detect enamel caries and interproximal caries. This will help dental practitioners to identify caries lesion with ease. This study makes use of MATLAB and it performs caries detection in three stages. First stage is the preprocessing phase where rotation of an image is performed, if necessary. Histogram study of the image is carried out to understand the intensity of carries. The second phase is image segmentation where individual tooth area is separated. Third phase is the identification phase where caries are detected. If caries are not detected, tooth is definitely healthy. © 2016 IEEE.

What happens to episode duration and cycle length over the course of bipolar disorder?
(2016) *Australasian Psychiatry*, 24 (4), pp. 376-380. Cited 1 time.

DOI: 10.1177/1039856215592322

Abstract
Objectives: Published scientific literature on cycle acceleration over the course of bipolar disorder has been equivocal. The present analysis aimed to find whether episode duration and cycle lengths become shorter over the course of bipolar disorder with predominantly manic polarity. Methods: The present study comprised 150 patients diagnosed with bipolar I disorder using SCID-I for DSM-IV TR. The course of illness was charted according to the NIMH Life Chart Methodology - Clinician Retrospective Chart (NIMH - LCM CRC). Spearman correlation was used to assess the relationship of episode duration and cycle length with the number of episodes. Results: The mean age of the sample was 37.8 years and the average duration of illness was 13.4 years. Unipolar mania comprised 52.7% of the sample. The episode duration and the cycle length decreased with increasing number of episodes (r=-0.245, p<0.001 & r=-0.299, p<0.001 respectively). Conclusion: The present study suggests that over the course of bipolar I disorder, cycle length and episode duration become shorter. © The Royal Australian and New Zealand College of Psychiatrists 2015.

Abstract
Exploit of photodegradation and photocatalytic activity of large scale synthesis of (CuSe) copper selenide semiconductor quantum dots was reported. The obtained nanocrystals were characterized by X-ray diffraction (XRD), UV-visible absorption spectroscopy (UV-vis) photoluminescence (PL) and high resolution transmission electron microscopy (HRTEM). The crystalline, nearly monodisperse with uniform size were synthesized by the reflux condensation method. This method promises a range of possibilities for the preparation of CuSe materials with enhanced properties. Experimental investigation shows the nanoscale photocatalysts with high surface area, small particle size and high crystallinity is of current interest in nanophase materials. The chemical composition of the CuSe samples and the valence states of elements were determined by X-ray photoelectron spectroscopy (XPS). We present our investigations to the shape and size of the quantum dots and are good agreement with experimental results. © 2016 Elsevier B.V. All rights reserved.

Abstract

Spinel MnxZn1−xFe2O4 (0.0 ≤x≤ 1.0) nanocatalysts were successfully prepared by simple one-pot microwave combustion method using glycine as the fuel. X-ray powder diffraction (XRD), energy-dispersive X-ray (EDX) analysis, and Fourier transform infrared (FT-IR) spectral results confirmed the formation of pure-phase cubic spinel structured products. Average crystallite sizes of the samples were calculated using Sherrer's formula, and the range from 21.15 to 15.48 nm. Spherical-shaped particles like nanostructured morphology were confirmed by high-resolution scanning electron microscopy (HR-SEM) and transmission electron microscopy (HR-TEM) analyses. Magnetic characterization of the samples was measured by vibrating sample magnetometer (VSM), and it was observed that the magnetization values increased with increasing Mn 2+ cation, due to the replacement of the non-magnetic nature of Zn 2+ by the higher magnetic moment of Mn 2+ in the ZnFe2O4 lattice and also the distribution of cations at tetrahedral (A) and octahedral (B) sites. Photocatalytic degradation (PCD) of methylene blue (MB) using spinel MnxZn1−xFe2O4 (0.0 ≤x≤ 1.0) nanocatalysts was carried out, and the PCD efficiency is increased with increasing Mn 2+ ions, and the sample Mn0.6Zn0.4Fe2O4 showed better efficiency than other samples, due to their smaller particle size and higher surface area. © 2016, Springer Science+Business Media New York.

Abstract
Biomedical signal processing aims at extracting significant information from physiological signals recorded from the human body. The various biomedical signals such as electroencephalography (EEG), electrocardiography (ECG), magnetoencephalography (MEG) etc. can be analyzed by using both independent component analysis (ICA) and principal component analysis. The main objective of this study is to assess the cognitive status of the individual using independent component analysis (ICA). The methodology of this study is to compare the different ICA algorithms and identify better algorithm for EEG signal processing; extract the feature parameter from the EEG signal and identify the cognitive status of subjects using a feature extracted parameter. Thus, finally the extracted parameter such as alpha, theta and beta band values is used to analyze the cognitive status of the individual. Our study concluded that wavelet packet decomposition of EEG showing increased beta activity and decrease in alpha activity with increase in theta activity during task performance is a good approach to assess mental fatigue and alertness level.

Abstract
Katakakhadiradi Kashayam is an Ayurvedic formulation for the treatment of diabetes, skin and urinary tract ailments. This is made up of 12 types of plants. The present study deals with the GC Ms analysis of this Kashayam to know the presence of different bio molecuels present in it. It was observed that it contained molecules like Ethyl acetate, 3-Trifluoroacetoxytridecane, 3- Trifluoroacetoxypentadecane, Dodecane, 1,2-dibromo-, 4-Trifluoroacetoxytridecane, Trichloroacetic acid pentadecyl ester, Trichloroacetic acid hexadecyl ester, E-14-Hexadecenal, E-11,13-Tetradecadien-1-ol 6- and Tridecene, (Z)- which have various medicinal activities. Further work is in progress to evaluate these molecules and correlate their activities to Katakakhadiradi kashayam. This study will help in better understanding of the mechanism of action of this medicine. © 2016, Global Research Online. All rights reserved.

Abstract
Amrithamehari churnam is an Ayurvedic formulation for the treatment of diabetes, weight loss and bladder disorders. The present study deals with the GC MS analysis of of Amrithamehari churnam. Fifty different peaks were observed indicating various bimolecules. It was observed that there is an indication of the presence of some compounds such as Pyridinium, 1-(2-hydrazino-2- oxoethyl)-, chloride, Arsonous dichloride, methyl-, 1-Dodecane, 2-Methoxy-4-vinylphenol, 1-Undecanol, 1-hexadecanol, Artumerone, Tumerone, Curlone, 4-Isoquinolinecarboxylic acid, 2, 3, 5, 6, 7, 8-hexahydro-3-oxo-, 1-Docosene, Squalene, á-Sitosterol, Benzenepropanoic acid, 3, 5-bis(1,1-dimethylethyl)-4-hydroxy etc. The medicinal values of each compound have similarity with that of the main drug, Amrithamehari churnam. Further work is in progress to prove the efficacy of this drug by standard methods. © 2016, Global Research Online. All rights reserved.

Author Keywords
Amrithamehari churna; Curlone; Diabetes; GC MS; Sitosterol; Tumerone

Index Keywords
4 isoquinolinecarboxylic acid, Amrithamehari churnam, arsenic derivative, ayurvedic drug, cosmetic, curlone, docosene, dodecane, hexadecanol, phenol derivative, propionic acid derivative, pyridinium derivative, sitosterol, squalene, turmerone, unclassified drug, undecanol; antimicrobial activity, antioxidant activity, Article, bladder disease, burn, cold, diabetes mellitus, drug efficacy, drug retention, inflammation, male infertility, mass fragmentography, nonhuman, prostate hypertrophy, thrombosis, weight reduction

Chemicals/CAS
dodecane, 112-40-3; hexadecanol, 29354-98-1, 36653-82-4, 51260-59-4; sitosterol, 19044-06-5, 83-46-5; squalene, 111-02-4, 7683-64-9; turmerone, 56485-42-8; undecanol, 112-42-5, 30207-98-8

Abstract
Agarose-gelatin-hydroxyapatite composites prepared by freeze-drying technique were gamma irradiated with various doses (25 kGy, 50 kGy and 100 kGy). X-ray Diffraction (XRD) analysis revealed the pure phase of HAp and the intensity of prominent planes of hydroxyapatite (Ca10(PO4)6(OH)2, HAp) were found to decrease on irradiation. Fourier Transform Infrared spectra (FTIR) showed functional groups of HAp and polymer composites, and higher disorder of the polymer matrix on irradiation. In addition, gamma irradiation led to a drastic reduction in the wettability (62%) and the compressive modulus (76%) of the scaffolds. There was significant enhancement (113%) in pore size of the scaffolds at higher fluence (100 kGy). The swelling and the dissolution studies of the gamma irradiated scaffolds showed that it had an appreciable change in the scaffold's mechanical and biological properties viz., compressive modulus, cell proliferation, hemolysis etc. The irradiated biomaterials exhibited enhanced hemocompatibility, antimicrobial activity and cell viability. The above results clearly reveal that the gamma irradiation is a suitable tool to tailor the multifunctional properties of the composites and could be used for various biomedical applications. © 2016 Elsevier Ltd and Techna Group S.r.l.

Abstract
Nanocrystalline TiO2 powders have been selectively prepared by the simple combustion reaction method using urea as a fuel. The crystalline powder was obtained using a silica basin heated directly on a hot plate at 500 °C until self-ignition occurred. After combustion process, the calcined products were obtained by heating the as-prepared powders for 1 h in air atmosphere at various sintering temperatures [500-900 °C]. The obtained nanopowder materials were systematically characterized by X-day diffraction (XRD), micro-Raman, UV-visible absorption (UV-vis), and Fourier transform infrared (FT-IR) spectroscopics. Powder XRD pattern shows the good agreement rutile phase structured TiO2 and the sharp diffraction peaks indicates good for crystallinity. The size of a symmetry of the nanoparticles have been measured with aid of a scanning electron microscopy (SEM), high resolution transmission electron microscopy (HR-TEM), and Brunauer, Emmett and Teller (BET) surface studies. The crystallinity of the powders was found to increase with respect to calcination temperatures. The average specific surface area of the particle was probed using gas adsorption-desorption measurements. Raman spectroscopy experiment was performed to ascertain the nature of TiO2 powder quality. UV-vis absorption spectra results showed the changes in the absorption edges of TiO2 report to increasing the calcinations temperatures. © 2016 Elsevier B.V. All rights reserved.

Abstract

Nickel doped spinel manganese ferrite (NixMn1-xFe2O4: x = 0.0-1.0) nanoparticles were prepared successfully by a superficial microwave irradiation technique using urea as the fuel. Powder X-ray diffraction (XRD) analysis was recognized the configuration of single phase spinel structure of NixMn1-xFe2O4. Debye Sherrer's formula was used to calculate the average crystallite size of the samples, which were found in the range of 15-20 nm. High resolution scanning electron microscopy (HR-SEM) was used to analyze the surface morphology of the samples, which showed the particle like-morphology with smaller agglomeration, and it was also confirmed by high resolution transmission electron microscopy (HR-TEM). Energy dispersive X-ray (EDX) analysis confirmed the elemental composition, which also evidence for the formation of single pure phase. Microwave heating method produced well crystalline nature of the products, which was confirmed by selected area electron diffraction (SAED) analysis. UV-Visible diffuse reflectance spectra (DRS) were used to calculate the energy band gap and the observed values are increased slightly from 2.05 eV to 2.44 eV with increasing the Ni-dapant. Magnetic characterization of the samples were analyzed by room temperature vibrating sample magnetometer (VSM) technique and the observed magnetization (Ms) values are decreased with increasing Ni content, due to the different magnetic moments of Mn2+ and Ni2+ cations. Photocatalytic degradation (PCD) of methylene blue dye was carried out by self designed photo-catalytic reactor. It was observed that PCD efficiency is increased with increase in concentration of Ni and the sample Ni0.6Mn0.4Fe2O4 shows better photocatalytic activity (96.73%) than other samples. © 2016 Elsevier B.V. Classification of water quality by water quality index of Perennial River Tamirabarani, Tirunelveli, Tamil Nadu
(2016) *Indian Journal of Environmental Protection*, 36 (6), pp. 493-508.

Abstract
The river Tamirabarani is one of the perennial rivers in India which feed 2 major districts (Tirunelveli and Thoothukudi) of Tamil Nadu. Due to high anthropogenic activities, urbanization practices, irrigational and livestock activities along the river bank habitations increases pollution threat. The present study was carried out to assess the quality of water and to classify the river stretches using multiplicative aggregation function. The results showed water quality deterioration during the month of April whereas remaining periods showed the quality upto fair level. Excellent quality of water was recorded at 21.53 %, very good quality at 28.47 %, good quality at 33.33 %, fair quality at 13.89 % and marginal quality at 2.78 % of sampling sites during the study tenure. Correlation study between physico-chemical properties also reveals significant negative relationship with the water quality index (WQI) scores. The index function makes easy interpretation of results which in-turn increases the effectiveness of management strategies to bringing back the originality of the river. © 2016 - Kalpana Corporation.

Abstract
A single source precursor was used for the synthesis Bi2S3 nanowires under ultrasonic agitation in presence of hexadecylamine as shape directing agent. The formation of Bi2S3 nanowires were isolated and characterized by X-ray diffraction, FT-IR, Raman, and FE SEM to study the crystal structure and morphology analysis respectively. The electrochemical behavior of catechol (CC) was studied using Bi2S3 nanowires modified glassy carbon electrode (GCE) in phosphate buffer saline (PBS). An enhanced oxidation peak current was noted for the Bi2S3 nanowires modified GCE, the present method was utilized for the electrochemical detection of dihydroxyphenol in aqueous medium. Abstract
In this paper, flow separation of a convergent-divergent (C-D) nozzle is placed downstream of a supersonic flow delivered from Mach 2.0 nozzle is investigated. Static pressure measurements are conducted using pressure taps. The flow characteristics of straight and slanted entry C-D nozzle are investigated for various NPR of Mach 2.0 nozzle. The effect of asymmetry at inlet by providing 15°, 30°, 45° and 57° cut is analyzed. Particular attention is given to the location of the shock within the divergent section of the test nozzle. This location is examined as a function both NPR of Mach 2.0 nozzle and test nozzle inlet angle. Some of the measurements are favorably compared to previously developed theory. A Mach number ratio of 0.81 across the flow separation region was obtained. © 2016 by De Gruyter.

Abstract
The present study was designed to investigate the synergism in hypoglycemic and hypolipidemic effect of hydro alcoholic extract of Herbal Formulation of Flax seed, Fenugreek and Jamun seeds (FFJ) and their individual drugs in diabetic animals. Due to the sedentary life style there is a drastic increase in chronic metabolic diseases such as diabetes mellitus. Even though many synthetic allopathic drugs are in use, most of the affected individuals search for the effective Herbal formulations because of their high efficacy, less or no side effects. Anti diabetic activity was evaluated in Streptozocin-Nicotinamide induced diabetic wister rats. The hydro alcoholic extract of herbal formulation of FFJ (1:1:1) and their individual drugs are given by oral route at doses of 200mg/kgbw for 30 days. The animal weight and food consumption were measured for every 15 days. On 31st day blood were collected by retero orbital puncture and Blood glucose, insulin, blood lipids, Haemoglobin(Hb), Glycosylated Hb(HbA1c), were measured on 31st day. Diabetic rats treated with Herbal Formulation of FFJ (1:1:1) and their individual drugs shown significant (P<0.05) reduction in the food consumption, blood glucose, blood lipid except HDL cholesterol, glycosylated Hb level and increased body weight, serum insulin level and Hb level and when compared to diabetic group. The percentage changes occur in Herbal Formulation FFJ treated group was greater than their individual drugs treated groups. This study concluded the formulation of FFJ was found to have greater antidiabetic effect compared to individual drugs of FFJ. © 2016, International Journal of Pharmacy and Technology. Abstract
Sensitising cancer cells and at the same time desensitizing normal cells is a double task in cancer management. Agents which can combat the debilitating side effects of cancer therapeutics and simultaneously synergize with anticancer agents in specifically targeting cancer cells are needed. Selenium, a proven anticarcinogen, gains due importance in terms of its efficacy to combat the side effects of cancer therapy. This study is a comparative analysis of the chemoprotective effects of selenium compounds, methyl selenol (generated from organic selenomethionine (5mmol/L ; METase 40U/L)) and sodium selenite (inorganic form)(30μM) in peripheral blood human lymphocytes exposed to cisplatin and mitomycin. Biochemical alterations occurring in many cells during apoptosis include loss of plasma membrane phospholipid asymmetry, DNA fragmentation, and activation of caspase-3. The present study demonstrated that the selenium metabolite and selenite are efficient in protecting lymphocytes undergoing DNA damage and exerted their activity by reducing caspase 3 expression. Interestingly organic methylselenol (MeSe) was found to offer more protective effects compared to inorganic selenite (SeL), by reducing the induction of apoptosis by the cytotoxic agents. This suggests that MeSe and to a lesser extent selenite might have potential for assessment in clinical trials and could be considered as strong candidates in pharmacogenomics or in the nutriprotective arena.

Author Keywords
Anticancer drugs; Apoptosis; DNA; Lymphocytes; Selenomethionine

Index Keywords
antineoplastic agent, antioxidant, caspase 3, selenium; apoptosis, cell culture, cell proliferation, chemistry, DNA damage, drug effects, enzyme linked immunosorbent assay, flow cytometry, human, lymphocyte, metabolism, pathology; Antineoplastic Agents, Antioxidants, Apoptosis, Caspase 3, Cell Proliferation, Cells, Cultured, DNA Damage, Enzyme-Linked Immunosorbent Assay, Flow Cytometry, Humans, Lymphocytes, Selenium

Chemicals/CAS
caspase 3, 169592-56-7; selenium, 7782-49-2; Antineoplastic Agents; Antioxidants; Caspase 3; Selenium

Funding details
University of SuwonUSW

This study was funded by the University Research fund of Catholic University of Daegu, S Korea, and co funded by University of Suwon, S Korea in 2013-2015.

Electromagnetic Properties and Humidity-Sensing Studies of Magnetically Recoverable LaMgxFe1−x O 3−δ Perovskites Nano-photocatalysts by Sol-Gel Route

(2016) *Journal of Superconductivity and Novel Magnetism*, 29 (6), pp. 1691-1701. Cited 193 times.

Abstract
Nanostructured perovskite mixed metal oxides, LaMgxFe1−xO3−δ (x= 0.0, 0.2, 0.4, 0.6, 0.8, and 1.0), were synthesized successfully by a simple sol-gel route. The formation of single-phase perovskite oxides structure was confirmed by powder X-ray diffraction (XRD) analysis. The average crystallite size of the samples was evaluated using Sherrer's formula. The presence of functional groups and metal oxide bonds was confirmed by Fourier transform infrared (FT-IR) analysis. Brunauer-Emmett-Teller (BET) surface adsorption studies showed better surface area of the compositions, which was further, evidenced by scanning electron microscopy (SEM) analysis. Room temperature vibrating sample magnetometer (VSM) analysis was confirmed that the superparamagnetic nature and the magnetization values decreased with increase in Mg-dopant. The samples were subjected to dc electrical conductivity studies at room temperature. The dc resistance measurements as a function of relative humidity (RH) at 5, 31, 51, 79, and 98 % were carried out on sintered discs at 25 ◦C under static conditions, which sensitivity factor Sf (R5% / R95%) were calculated for LaMgxFe1−xO3−δ. The temperature-dependent conductance was also carried out in the range of 100–300 ◦C as suggested, and the activation energy was determined. Sample LaMgFe-4 (x= 0.6) possessed the highest humidity-sensing factor (12,926.03 ± 387), while LaFeO3 (x= 0) possessed the lowest sensitivity factor (41.66 ± 3). The response and recovery characteristics were studied for LaMgFe-4, which exhibited a very good narrow hysteresis loop. The photocatalytic degradation (PCD) of methylene blue (MB) dye was investigated under UV-visible light and the sample LaMgFe-4 showed better PCD efficiency than other samples, due to the smaller particle size and higher surface area. © 2016, Springer Science+Business Media New York.

Abstract
Sodium alginate (biopolymer) stabilized silver nanoparticles (SA-AgNPs) were synthesized and characterized by UV-vis spectroscopy, XRD, FTIR, SEM, EDAX and TEM. UV-vis spectra recorded the absorbance peak at 407 nm due to its surface plasmon resonance. XRD measurements indicated the crystalline nature of particle with various Bragg's reflection peaks at (111), (200) (220), (311) and (222) planes. FTIR spectra showed the possible functional groups at 3443, 1616, 1384, 1092, 1209, 835 and 774 cm-1. SEM and TEM showed that the particles were spherical in shape and the size was in the range of 23 ± 2 nm. EDAX analysis showed that the weight percentage and elemental silver in the composition was 57.80. The ecotoxicity of SA-AgNPs was assessed on the freshwater crustacean, Ceriodaphnia cornuta. SA-AgNPs caused 100% mortality of C. cornuta at 40 µg L-1, whereas AgNO3 caused100% mortality of C. cornuta at 10 µg L-1. The accumulation of Ag+ by C. cornuta was increased at increasing concentration and reached 3.4 µg/g dry weight at 50 µg L-1. C. cornuta exposed to AgNO3 showed blackening of intestine at 5 and 10 µg L-1. On the otherhand, the visible uptake, ingestion and accumulation of SA-AgNPs in the intestine of C. cornuta were clearly visualized under CLSM after treated with 10, 20 40 and 50 µg L-1. The abnormal swimming, reduced heart rate and thoracic limb movement of C. cornuta were also observed after exposure to 50 µg L-1of SA-AgNPS. The synthesized SA-AgNPs were tested for its antibiofilm activity against Gram positive (Listeria monocytogenes) and Gram negative (Vibrio parahaemolyticus) bacteria. SA-AgNPs effectively inhibited the biofilm growth of L. monocytogenes and V. parahaemolyticus at 75 µg mL-1. © 2016 Elsevier Ltd. All rights reserved.

Abstract
We report the effect of calcination on the structural and optical properties of nanocrystalline NiO nanoparticles were successfully synthesized by virtue of a single source precursor method at mild reaction conditions between nickel nitrate and sodium hydroxide. Composition, structure and morphology of the products were analyzed and characterized by X-ray powder diffraction (XRD). The ultra-violet visible (UV-vis) absorption peaks of NiO exhibited a large blue shift and the luminescent spectra had a strong and broad emission band centered at 328 nm. The intense band gap was also observed, with some spectral tuning, to give a range of absorption energies from 2.60 to 3.41 eV. The various functional groups present in the NiO nanorods were identified by FTIR analysis. High resolution transmission electron microscopy (HRTEM) and the chemical composition of the samples the valence states of elements were determined by X-ray photoelectron spectroscopy (XPS) in detail. The electrochemical response of NiO proved that the nano-nickel has a high level of functionality due to its small size and higher electrochemical activity without any modifications. The above studies demonstrate the potential for the utilization of NiO nanoparticles as a promising material for opto-electronics applications. © 2016 Elsevier Ltd and Techna Group S.r.l. Abstract
Background: Construction industry is the second largest employment giving industry in India with many semi-skilled or unskilled workers taking up the occupation for livelihood without any training and proper guidance. Aim: To evaluate the pathogenic association of cement exposure to occupational contact dermatoses as evidenced by immune markers and to correlate their pulmonary functions with years of exposure to cement. Setting and Design: This was a cross-sectional study conducted among randomly selected cement workers. Methods and material: Evaluation of socioeconomic status (SES) and years of exposure of cement workers was done using a questionnaire. Clinical examination of skin lesions and strip patch test with application of potassium dichromate on unexposed skin was performed. Results were interpreted after 48 hours. Absolute eosinophil count (AEC) and IgE levels measured, and spirometric evaluation was performed. Statistical Analysis: Analysis of variance and Pearson's correlation test were used for data analysis. $P < 0.05$ was considered to be statistically significant. Results: Clinically, skin lesions were noticed in 51%, elevated AEC in 47%, and raised Anti IgE in 73%. Two participants developed positive reactions to the skin strip patch test. Duration of exposure to cement and SES were compared with clinical skin lesions. Spirometry result was normal in 81%, obstruction in 8%, restriction in 10%, and mixed pattern in 1%. Forced expiratory volume at 1.0 second, forced expiratory flow (25-75%), and (PEFR) Peak Expiratory Flow Rate were markedly reduced with years of exposure. Workers who had greater skin lesions and with increase in exposure had increased AEC and IgE levels, although statistically not significant. Conclusions: Exposure to cement and poor SES is strongly correlated to increased prevalence of skin lesions and reduced pulmonary functions. © 2016 Indian Journal of Occupational and Environmental Medicine. Abstract

Copper doped spinel manganese ferrite (CuxMn1-xFe2O4: x = 0.0-1.0) nanoparticles were prepared successfully by a facile microwave irradiation technique using urea as the fuel. Powder X-ray diffraction (XRD) analysis showed that all samples have pure cubic spinel phase, and the average crystallite size is found to be in the range of 14.55 to 19.27 nm. The surface morphology of the samples were analyzed by high resolution scanning electron microscope (HR-SEM) analysis, and was found that nanoparticles like morphology of the powders. Energy dispersive X-ray (EDX) analysis showed that the all composition have pure spinel phase. The magnetic properties were investigated at room temperature by using the vibrating sample magnetometer (VSM) and the magnetic hysteresis (M-H) loops confirmed the ferromagnetic behavior for all the samples with magnetization (Ms) values are decreased with increasing in the Cu2+ ions. Photocatalytic degradation (PCD) of methylene blue dye was carried and it was observed that PCD efficiency is increased with increasing the concentration of Cu up to x = 0.6, and the sample Cu06Mn04Fe2O4 shows better activity (98.54%) than other samples. Abstract
Spinel CoAl2O4 nanoparticles were synthesized via Opuntia dillenii plant extract microwave heating method. Opuntia dillenii plant extract-assisted combustion method makes straightforward synthesis, which is alternative process of spinel nanoparticles preparation. The synthesized spinel CoAl2O4 nanoparticles was successfully characterized by powder XRD pattern, FT-IR spectra, EDX analysis, HR-SEM analysis, and VSM techniques. XRD pattern, FT-IR and EDX results established the development of spinel and single cubic phase CoAl2O4 nanocrystals. The formation of spherical shaped nanoparticles was confirmed by HR-SEM technique. VSM measurements revealed that CoAl2O4 sample have superparamagnetic behavior. It was found that CoAl2O4 nanoparticle is highly active towards the selective oxidation of benzyl alcohol into benzaldehyde at a low temperature with very high yield, due to the higher surface area and number of active sites. Abstract
Spinel MnAl2O4 nanoparticles were prepared effectively by simplistic, economical microwave heating method (MHM) using Opuntia dillenii extract as reducing agent. The samples were successfully characterized by powder XRD pattern, EDX spectra, FT-IR analysis, HR-SEM analysis, and VSM instrumentation techniques. Powder XRD, EDX and FT-IR results demonstrated that the products contain a pure single-phase spinel structure lacking of other secondary phase impurities. HR-SEM results confirmed the spherical shaped nanoparticle morphology of the sample. Magnetic characterization property was confirmed by VSM analysis. VSM hysteresis loop established the superparamagnetism of the sample and the magnetization (Ms value of MnAl2O4 is 0.023 emu/g. It was found that MnAl2O4 nanoparticle is highly active towards the selective oxidation of benzyl alcohol into benzaldehyde at a low temperature with very high yield, due to the higher surface area and number of active sites. Abstract
Nanostructured nickel molybdate (NiMoO4) nanoparticles (NPs) were successfully synthesized by using nickel nitrate and ammonium molybdate as the precursors and citric acid as the fuel by a simple modified sol-gel method. The prepared samples were characterized by powder X-ray diffraction (XRD), Fourier transform Infrared (FT-IR) spectra, high resolution scanning electron microscope (HR-SEM), energy dispersive X-ray (EDX), UV-Visible diffuse reflectance spectra (DRS), photoluminescence (PL) spectra and vibrating sample magnetometer (VSM) techniques. Powder XRD, FT-IR and EDX results were confirmed that the resultant powders was pure and single phase crystalline with monoclinic structure. HR-SEM images show that the morphology of the obtained powder consist nanostructued particles-like morphology. VSM results showed ferromagnetic behavior of the samples. Photo-catalytic activity of NiMoO4 NPs was tested for the photo-catalytic degradation (PCD) of methylene blue (MB) and it was found that higher PCD efficiency. Abstract
Perovskite-type mixed oxide La1-xCoxVO3-δ (x = 00, 0.2, 0.4, 0.6, 0.8 and 1) composites were successfully synthesized by a simple co-precipitation method. Powder X-ray diffraction (XRD), Fourier transform infrared (FT-IR) and Energy dispersive X-ray (EDX) analysis were confirmed that all compositions crystallized with orthorhombic LaVO3 perovskites structure without any other secondary phase impurities. The lattice parameters values decreased with increase in Co2+ dopant, due to the smaller ionic radius. High resolution scanning electron microscope (HR-SEM) images revealed that the prepared nano-composites are high crystalline with particle size distribution in 80-95 nm range. BET surface area studies revealed that the sample La0.8Co0.2VO3-δ have higher surface area than other samples, due to their smaller particle size. The samples were subjected to humidity sensing studies by solid-state electrical conductance studies. The studies revealed that La0.8Co0.2VO3-δ is a good candidate for humidity sensors with a higher Sf of 9245.68. The higher Sf of La0.8Co0.2VO3-δ is due to the larger surface area. A multi- Agent based intelligent query processing system for hadoop with foundation for intelligent physical agents-os using cooperating agent in cloud environment

(2016) *Journal of Computational and Theoretical Nanoscience*, 13 (5), pp. 2774-2779. Cited 2 times.

Abstract
The cloud provides a flexible environment for customers to host and process their information. Many applications dealing with massive data and complex queries are routed to the cloud. The response time depends on query optimization and resource scheduling. There are several techniques to optimize the query and resource scheduling but the information about the query is not stored i.e., the frequent queries will recursively do the same set of procedures. Hence, to reduce the time consumed by redundant query processing procedure we introduce agents in Hadoop framework (JobTracker). As JobTracker is a single point of failure i.e., if this goes down, all running jobs are halted. Therefore, we introduce agents in place of JobTracker to intellectually process the query and assign the task to TaskTrackers. Here we use FIPA-OS (Foundation for Intelligent Physical Agents) toolkit enabling rapid development interacting agent based system in the JADE (Java Agent Development Environment) platform. Immediate effects of Bhramari pranayama on resting cardiovascular parameters in healthy adolescents

(2016) *Journal of Clinical and Diagnostic Research*, 10 (5), pp. CC17-CC19. Cited 23 times.

DOI: 10.7860/JCDR/2016/19202.7894

Abstract
Introduction: In yoga, Pranayama has a very important role in maintaining sound health. There is some strong scientific basis on constant physiological changes produced when pranayama is practiced for long duration. Still, there exists a dearth of literature on the effect of Bhramari pranayama (Bhr.p) on physiological systems. Aim: To assess the immediate effect of Bhramari pranayama (Bhr.P) practice on the resting cardiovascular parameters in healthy adolescents. Materials and Methods: Sixty apparently healthy adolescents of both sex participated in the study. They were randomly divided into Bhr.P (n-30) and control (n-30) group. Informed consent was obtained after explaining the detailed procedure of the study. Bhr.P group practiced Bhramari pranayama for 45 min (5 cycles) and control group was allowed to do normal breathing (12-16 breath /min). Heart rate (HR) was assessed by radial artery palpation method and blood pressure was recorded in supine position after 5 minutes of rest by sphygmomanometer. Results: The HR reduced significantly (p-0.001) in Bhr.P group. BP indices, Pulse Pressure (PP), Mean Arterial Pressure (MAP), Rate Pressure Product (RPP) and Double Product (DoP) significantly decreased after Bhr.p practice compared with control. Pre and Post inter group analysis also showed that significant reduction in HR and BP indices in Bhr.P group. Conclusion: Present study showed that Bhr.P practice produces relaxed state and in this state parasympathetic activity overrides the sympathetic activity. It suggests that Bhramari pranayama improves the resting cardiovascular parameters in healthy adolescents. © 2016, Journal of Clinical and Diagnostic Research. All rights reserved.

Simulation of soil water retention curve using artificial neural networks with pseudocontinuous pedotransfer functions

(2016) *International Journal of Applied Engineering Research*, 11 (7), pp. 4700-4706. Cited 1 time.

[a] Department of Civil Engineering, Bharath University, Chennai, Tamil Nadu 600073, India
[b] Department of Civil Engineering, Anna University Regional Center, Thiruchirappali, Tamil Nadu 620 024, India

Abstract
Artificial neural networks for estimating the soil water retention curve have been developed considering measured data and require a large quantity of soil samples because only retention curve data obtained for the same set of matric potentials can be used. In order to preclude this drawback, we present two ANN models which tested the performance of ANNs trained with fitted water contents data. These models were compared to a recent new ANN approach for predicting water retention curve, the pseudocontinuous pedotransfer functions (PTFs), which is also an attempt to deal with limited data. Additionally, a sensitivity analysis was carried out to verify the influence of each input parameter on each output. Results showed that fitted ANNs provided similar statistical indexes in predicting water contents to those obtained by the pseudocontinuous method. Sensitivity analysis revealed that bulk density and porosity are the most important parameters for predicting water contents in wet regime, whereas sand and clay contents are more significant in drier conditions. The sensitivity analysis for the pseudocontinuous method demonstrated that the natural logarithm of the matric potential became the most important parameter, and the influences of all other inputs were reduced to be not relevant, except the bulk density. © Research India Publications.

Prevalence and clinical relevance of Schmorl's nodes on magnetic resonance imaging in a tertiary hospital in Southern India

(2016) *Journal of Clinical and Diagnostic Research*, 10 (5), pp. TC06-TC09. Cited 2 times.

DOI: 10.7860/JCDR/2016/19511.7757

Abstract
Introduction: Schmorl's Nodes (SN), which appear as defects in superior and inferior endplates of vertebrae, are commonly seen around the thoracolumbar junction. They may be asymptomatic or symptomatic. Their prevalence varies with respect to age, gender, regions involved and other associated disc or vertebral findings. Aim: SN is quite a common finding on the Magnetic Resonance Imaging (MRI) of the spine. The purpose of the study is to evaluate the prevalence of SN in the patients who underwent MRI whole spine in the radiology department, ascertain its clinical relevance and to compare the prevalence of SN in the study population with the prevalence in rest of the Indian and global population described already in the literature. Materials and Methods: Clinical history and MRI images of the patients who underwent whole spine MRI study in the Radiology Department during the period of 6 months from June to December 2015 were retrospectively reviewed. The prevalence of SN, their location and associated imaging findings were studied. Results: Of the 509 patients in the study, 47 had SN at one or more levels with prevalence of 9.2%. Maximum cases were seen in the 4th decade with least cases in the extremes of age. Twenty five patients had SN at thoracic levels. Twenty five patients had SN at lumbar levels. Twenty eight patients had SN at one intervertebral disc level. Other 19 patients had SN at multiple levels. Of the total 103 SN found, 57 were seen in the superior endplates and 46 in the inferior endplates. All SNs were in central position, except for one. Twelve of the 47 patients had disc degeneration at the same level as SN. Forty two of the 47 patients (89%) with Schmorl's nodes had associated spinal disc degenerative disease at the same or different levels. Modic type II endplate changes were demonstrated at the same level in 10 of the 47 patients with SN. Thirty eight of the 47 patients presented with history of backache. Only 9 of these patients had come with history of trauma; of these only four had wedge compression fracture at the level of SN. Conclusion: Schmorl's nodes in the studied South Indian population appear to show one of the lowest prevalence described on MRI, so far. Maximum number of SN occurred in the lower thoracic spine followed by the proximal lumbar spine. Schmorl's nodes are commonly associated with degenerative disc disease of the spine, though not at the same level. © 2016, Journal of Clinical and Diagnostic Research. All rights reserved.

Abstract
Nanocrystalline perovskite oxides, LaMgxCr1−xO3−δ (x=0.0, 0.2, 0.4, 0.6, 0.8 and 1) were prepared by sol-gel method. The samples were characterized by powder X-ray diffraction (XRD), scanning electron microscopy (SEM), Fourier transform infrared (FT-IR) spectroscopy and nitrogen adsorption/desorption isotherms at 77 K, respectively, to identify the structural phases, surface morphology, vibrational stretching frequencies and BET surface area of the samples. Also, it was investigated the humidity sensing characteristics of the samples. The composites were sintered at 800 °C for 5 h and subjected to dc electrical conductivity studies at room temperature. The resistance measurements as a function of relative humidity (RH) in the range of 5-98% were done and the humidity sensing factors (Sf =R5%/R98%) calculated. The activation energy of the compounds were determined from the temperature-dependent electrical conductance experiments in the temperature range of 120-300 °C. LaMgCr-3 (x=0.4) had the highest humidity sensing factor 21407±431, while LaCr-1 (x=0) the lowest sensitivity factor 27.27±2. The response and recovery characteristics were studied for LaMgCr-3, which exhibited good linearity and a very narrow hysteresis loop. The photocatalytic activity of LaMgxCr1−xO3−δ was investigated by using the photo-decomposition of 4-chlorophenol (4-CP) under UV-visible light. The sample LaMgCr-3 (x=0.4) showed the highest photocatalytic degradation efficiency (93.05%) than other samples, due to their smaller size of particles with higher surface area. © 2015, Korean Institute of Chemical Engineers, Seoul, Korea.

Abstract

Metal-oxide heterostructures are very important materials for developing various toxic gas/chemical detection sensor systems. However, the major factors, such as sensitivity, selectivity, stability, response, and recovery times of the sensors, still need to be optimized for practical technological applications. Low-dimensional materials have shown tremendous potential to solve majority of the critical issues due to their surface chemistry than that of their bulk form. In this paper, the role of nanostructured n-ZnO/p-NiO heterostructure as room temperature (RT) ammonia sensor has been investigated. Toward this paper, the electrospinning method was employed to prepare heterostructure metal-oxides blended with polyvinyl alcohol (n-ZnO/p-NiO) nanofibers. The systematic characterizations of the obtained n-ZnO/p-NiO heterostructure were performed using X-Ray diffractometer, scanning electron microscope, and photoluminescence spectrophotometer. Furthermore, the RT ammonia sensing characteristics were investigated. © 2016 IEEE.

N-bit CMOS comparator using parallel prefix tree

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E269-E272.

[a] Dept of Electronics and Communication Engg, Bharath University, Chennai-73, India
[b] Dept of Electronics, S.N.R. Sons College, Coimbatore-06, India

Abstract
It provides new comparator model gives large range experience, with faster operation by converting Digital CMOS cells. This comparator make use of N-bit scalable parallel prefix constructs strategic advantage of comparison from the MSB towards the LSB by bit by bit comparing as there are equal by setting the status bit. The advantages of these comparators are high speed and low power for a wide range. The design uses the standard VLSI design that can be varied for logical derivations of delay as the role of bandwidth range. HSPICE model for 32 bit comparator shows defective case input and output delay of 0.86ns at most power wastage of 7.7mW. © 2016 SPB Pharma Society . All Rights Reserved.

Face recognition system using embedded system

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E297-E300.

[a] Professor of Electronics, Bharath University, Chennai-73, India
[b] Department of Electronics, S.N.R Sons College, Coimbatore, India

Abstract
Face recognition is most widely used in this world to verify a person's identity because this method is intrusive and more accurate than any other biometric measurement. The other biometrics are extracted by non-intrusive method ie., a physical contact is needed in this case. Here an embedded based system is designed to capture and process the images for face recognition. A test plat form is designed and tested with the developed system which shows that this system has a 91% accuracy in recognize the face when the threshold is fixed between 2000 and 3500. © 2016 SPB Pharma Society . Analysis and design optimization of electrodes setup for MPD thruster
(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E1-E5.

[a] Department of Aeronautical Engineering, Bharath University, Chennai, Tamilnadu, India

Abstract
Magneto Plasma Dynamic thruster is one of the developing fields in the history of propulsion. It comes under the concept of electric propulsion which involves production of plasma with the help of electrical components in order to produce the thrust required to move the satellite or a spacecraft. The main reason for using the electric propulsion is to increase the range of the spacecraft or a satellite; moreover it could replace large amount of chemical propellant hence providing space for more payload. It gives more opportunity for Δv missions. Significant amount of thrust can be produced with the help of the experimental setup. It has got the following blocks: High current power supply, ignition circuit, thruster which converts electrical energy into kinetic energy and measuring unit. The voltage source along with the high voltage transformer and capacitor banks were the notable components in this unit. The Thruster Electrode setup and measuring units are two important and crucial setup which requires more analysis and prepare design. Hence this paper mainly focuses on the thrust production for various thruster electrodes parameter. © 2018 SPB Pharma Society. All rights reserved.

Assessment of risks in the purchase process of construction companies

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E141-E144.

[a] Department of Civil Engineering, Bharath University, Tamil Nadu, India
[b] Construction Engineering and Management, SRM University, Tamil Nadu, India

Abstract
This paper is apprehensive with the measurement of risk in the purchase progression of a construction company. Risk has been defined as a measure of the probability, the severity, and the exposure of all hazards of an action. Risk management is at the core of any production or group. This is central to any business regardless of size, activity, or sector. Construction industries can lose considerable sums of money as a result of breakdown to identify and calculate risk in time. Industries may even sacrifice their opportunity to take improvement of potentially useful opportunities arising in the course of their activities if risks are not recognized in good time. Risk management is, therefore, as much about looking ahead to identify further opportunities as it is about avoid or mitigating losses. © 2016 SPB Pharma Society. All Right Reserved.

Retrospective analysis of a theoretical model used for forecasting future air quality near the North Chennai thermal power plant

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E258-E264.

[a] Department of Civil, Bharath University, Chennai, 600 073, India
[b] Department of Civil Engineering, Annamalai University, Annamalainagar, Tamil nadu 608 002, India

Abstract
The trend of gathering of Baseline Air Quality data commenced in Chennai as early as 1981, as an academic exercise, undertaken by some post-graduate students of the Centre for Environmental Studies in Anna University, Chennai (1,2,3,4). The study revealed that the baseline air quality data were only at moderate levels, in respect of the three major air pollutants, namely, Sulphur Dioxide (SO2), Nitrogen Dioxide (NO2), and Suspended Particulate Matter (SPM), in Ennore-Manali Industrial area. All these pollutants measured for the respective averaging times, were below the National Ambient Air Quality Standards prescribed for each pollutant, respectively. Therefore, it was possible to convince the Department of Environment & Forests, Government of India, New Delhi that the Environmental Clearance be given, for the proposed establishment of the 3x210 MW coal-fired thermal power plant in the Ennore Island location, with the financial assistance from the Asian Development Bank to the Tamil Nadu Electricity Board. The present status of air quality in the same area needs to be assessed in the light of the Revised National Ambient Air Quality Standards, especially in view of the newly introduced parameters, namely, PM10 and PM2.5, which were not in force in the year 1986. There are a few more industries which have come up after 1986, and which have relevance to emission of air pollutants, namely, SO2, NO2, and SPM (inclusive of PM10 and PM2.5), having adverse effects on human health. © 2016 SPB Pharma Society. Analysis of base-jet exit shape on the wake axis mean velocity and velocity fluctuation behind circular cone
(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E6-E9.

[a] Department of Aeronautical Engineering, Bharath University, Chennai, India
[b] Department of Aerospace Engineering, Madras Institute of Technology campus, Anna University, Chennai, India

Abstract
Length of the basejet stagnation point obtained from the time averaged mean velocity distribution along the wake axis of a circular cone under isothermal conditions is presented. At low subsonic speed of 25m/s (Re= 0.6666 x 105), all the experiments were executed. Air at atmospheric temperature was injected at three different base-jet injection ratios as 0.5, 1.0, and 1.5 from the base of the cone. Constant Temperature hot-wire Anemometer was used to measure velocity. Circular, square and hexagonal cross section shape base jets of size one percentage of base area (AR = 0.01) were used in the experiments. Some notable conclusions made from the experimental results are, as the basejet momentum ratio increased the jet stagnation point length also increased logarithmically. At constant momentum ratio, the effect of corner vortices generated (loss in momentum) from the square jet causes decrease in length of jet stagnation point than an equivalent area ratio circular jet. Hence a square cross section basejet mixes early with primary jet than an equivalent area circular jet at constant momentum ratio. © 2016 SPB Pharma Society. All Right Reserved.

Numerical study of mixing in shear layers

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E56-E58.

[a] Department of Aeronautical Engineering, Bharath University, Chennai, 600073, India
[b] Department of Aeronautical Engineering, Anna University, MIT Campus, Chennai, 600044, India

Abstract
This paper describes the numerical analysis of the mixing phenomena based on shear layers in a rectangular duct. The shear flow between two parallel streams of flows in the same rectangular duct divided into two zones is analyzed. Then, the effect of variation of velocities and flow directions in the above model is analyzed and discussed. Three different cases have been studied in this analysis. A simple rectangular duct is used where two flows of velocities in same and different proportions and along with same and different directions are studied. After going through sample simulations using various turbulence models, the numerical analysis was carried out using the SST k – ω model as it gave better results. The results indicate that asymmetry in velocity and direction leads to better mixing. The case where the two flows having velocities 5 m/s and 10 m/s were simulated with their direction being different, the estimated turbulent kinetic energy was highest for this case with a maximum value of 3 m2/s2. © 2018 SPB Pharma Society. Study on time space management in work zones from tambaram to chengalpet in NH45

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E130-E134.

[a] Department of Civil Engineering, Bharath University, Tamil Nadu, India
[b] Construction Engineering and Management, SRM University, Tamil Nadu, India

Abstract
Time Space Management is the management of the flow of traffic with respect to the time duration in the work zones along the highway. Time space management is highly important as it enables in easy understanding of the highway and allowing easy movement of traffic along work zones without traffic jams and loss of precious time. Model analysis is done to prioritize the major risk factors involved in the practices carried out in the work zones. The various risk involved in the road repair process is properly studied with the help of the results collected from the various road contractors and engineers. Based on the findings the average by the mean, mode and the range. The various factors which were found out were formulated with the social sciences method. The tool is highly reliable and enables us in prioritize the various risk based factors and finding out a suitable solution for carrying out of road repair in the work zone. The traffic inflow into the NH45 was carried out in the basis of the classification of time periods as traffic varies with time. The findings comprises of the various high risk factors and a model is formulated for the easier carrying out of work in work zone. © 2016 SPB Pharma Society. All rights Reserved.

An effective waste tracking system for hospitals

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E318-E320.

[a] Department of Computer Science and Engineering, Bharath University, Chennai, Tamilnadu, India
[b] Department of Computer Science and Engineering, St. Joseph's College of Engineering, India

Abstract
The hospital facilities and Common Treatment Facility (CTF) which goes under the Pollution Control Board, are utilizing various desktop PCs, inconsistent correspondence interface, and intruded on force give and net office to stay records of the transfer of waste from doctor's facilities to CTF. The doctor's facilities ought to pay immense amount of money to the CTF to arrange their produced waste, however hospital facilities aren't willing to pay the aggregate amount to the CTF. Thus the hospital facilities offer fix amount to the people worried inside of the transfer of waste transportation and demand them to toss the squanders publically junk. Because of this offense, Government has set up a demonstration in 1998 expressing that the waste produced using the hospital centers should exclusively be arranged at the bio medicinal normal treatment office and not out in the open ranges". Individuals who don't take after the principle are unfree for measure of 5years with a fine amount of one hundred thousand rupees. Keeping in mind the end goal to moderate the above said issue, we are thinking of an android application that will track the wastage development from clinics to CTF which can maintain a strategic distance from the transfer of wastage in broad daylight junk zones alongside other non-Biomedical squanders. © 2016 SPB Pharma Society. Effect of circular exit shape base jet injection ratio on the velocity distribution along the wake axis of an elliptic cone

(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (2), pp. E52-E55.

[a] Department of Aeronautical Engineering, Bharath University, Chennai, India
[b] Department of Aerospace Engineering, Madras Institute of Technology campus, Anna University, Chennai, India

Abstract
Time averaged mean velocity and velocity fluctuation along the wake axis of an elliptic cone with base-jet injection is presented. At subsonic free-stream velocity of 25m/s (Re= 0.6666 x 105), all the experiments were executed in a table top wind tunnel. From the base of the cone air at atmospheric temperature was injected from a circular exit shape base-jet at three different base-jet injection ratios (IR) as 0.5, 1.0 and 1.5. Constant Temperature hot-wire Anemometer (DANTECH-CTA) was used to measure velocity. Circular exit shape base-jets of three different sizes (AR = 0.005, 0.01 and 0.015) were used in the experiments. Some notable conclusions made from the experimental results are, at lower base-jet injection velocity effect on the location of wake axis parameters is insignificant, due to insufficient momentum of the base-jet to encounter the recirculating fluid. Irrespective of the jet size the rate of expansion of a jet injected from an elliptic cone is greater than that of circular cone. © 2018 SPB Pharma Society. All Rights Reserved.

Abstract
Distributed computing (an electronic enlisting), is used to pass on encouraged organizations over the web. The essential issue in the dispersed processing is that it depends on upon the fundamental client server auxiliary arranging. Answer for this issue in vicinity is the fuse of two perfect models. In the present circumstance, the antivirus presented in the client structure utilizes the system resources paying little mind to the way that it is in the unmoving state. Presenting the Antivirus programming in each one of the clients will be a Resource Hungry Process. So the System's benefits can't be utilized properly in addition. Here we propose disseminated figuring based utilization of antivirus in system auxiliary building. © 2018 SPB Pharma Society. All rights reserved.

Abstract
The aim of this study is to produce useful composite materials from fly ash, a major Waste product of coal combustion from power plants. The synthesis, characterization of polyaniline (PANI) and flyash composites gives wide area of applications. The electrochemical analysis of the composites showed that the composites were conductive. The SEM of the composites was studied by Scanning Electron Microscopy (SEM) and showed that our methods gave composites with improved homogeneity as compared to other reported methods. © 2018 SPB Pharma Society. An automatic emotion detection system from face image of a video using Bacterial Foraging Optimization
(2016) *International Journal of Applied Engineering Research*, 11 (6), pp. 4288-4295. Cited 1 time.

Abstract
Recognition of human face emotions plays challenging and crucial role in designing some applications such as computer-aided learning and human-computer interaction system. It becomes more professional when recognizing face emotions from a sequence of images or video. Instead of directly classifying facial expressions into set of basic emotion classes, there are numerous methods to recognize the fundamental facial muscle behaviors and then interpret these in terms of capricious categories such as sad, surprise, neutral or happiness. The main intention of this paper is to develop an automatic emotion detection system with BFO (Bacterial Foraging Optimization) algorithm and Weiner Filter. Initially, detection of face spot in an image is performed and then parameters from the LBP (Local Binary Pattern) algorithm are used as features for the recognition system that is capable to successfully recognize faces related to the above mentioned emotion categories. Even though quite a lot of classification algorithms employs for face emotion recognition our paper takes the advantages of KNN algorithm since its classification accuracy is high. © 2016, Research India Publications.

A hybrid LWT-DWT digital image watermarking scheme using LSVR and QR-factorization

(2016) *International Journal of Applied Engineering Research*, 11 (6), pp. 4335-4342. Cited 3 times.

[a] Department of CSE, Bharath University, Chennai, India
[b] Department of CSE, VBIT, Hyderabad, India
[c] Department of IT, Bharath University, Chennai, India

Abstract
The digital image watermarking is an art of hiding secret image into source image. The robust approach of this watermarking practice is to trade-off image quality (invisibility) and embedding capacity. In this proposed article we present an efficient and hybrid approach that integrates features of lifted wavelet transform (LWT) and discrete wavelet transform (DWT) based on linear support vector regression (LSVR) and QR-factorization for watermarking. Initially, the QR-barcode (watermark image) grayed to achieve maximum watermarking capacity. The correlation feature of LWT is used to decompose image into non-overlapping blocks. The QR factorization is further decompose into Q and R matrices. The LSVR is obtain input samples from R-matrix for training and learning purpose. In the second segment, we implement the DWT based multi-channel fake-proof authenticity mechanism. Precisely the integrated hybrid approach produces less distortion rate. The experimental results is analyzed with other models and offers high reliability on watermark embedding and authenticity along with less computational cost. © 2016, Research India Publications.

A novel semi-blind video watermarking using KAZE-PCA-2D Haar DWT scheme

(2016) *2015 IEEE International Conference on Computational Intelligence and Computing Research, ICCIC 2015*, art. no. 7435721, . Cited 2 times.

DOI: 10.1109/ICCIC.2015.7435721

[c] Department of IT, Bharath University, Chennai, India

Abstract
In this research article the digital video watermarking technique is projected through a semi-blind pattern. The proposed method involves frame-spot matching model based on KAZE method at the initial stage, The KAZE method is deployed for matching the edge points of frame-spots with all video frames with the intention to detect the embedding and extract the respective regions. Then the frame entropy blocks are designated and converted by PCA (Principal Component Analysis) blocks. The QIM (Quantization Index Modulation) is employed to quantize the highest coefficient values on each PCA entropy chunks of every sub-band. The single shared secure key is employed to recover the watermarked content. The DWT (Discrete Wavelet Transform) is applied on every single video frame and disintegrate into group of sub-bands. During extraction this is simply reversed; however the KAZE frame-spot is harmonized through each frame edge points. The parameters like rotation, scaling and translation are assessed and the watermarked evidence can be effectively extracted. The proposed pattern is verified using a numerous of video structures and compared with other similar models such as SURF, SIFT, PCA-SIFT, KAZE and perceived high optimal results. The investigational outcomes demonstrated high imperceptibility and high strength against numerous outbreaks like JPEG encoding, addition of Gaussian noise, gamma modification, histogram equality and contrast rectification in both forms of ordinary videos and clinical videos. © 2015 IEEE.

Is red blood cell distribution width (RDW) A novel renal biomarker for diabetic complications?
(2016) *International Journal of Pharmaceutical Sciences Review and Research*, 37 (2), art. no. 29, pp. 163-168.

[a] Shri Sathya Sai Medical College and Research Institute, Kancheepuram District, Ammapettai, India
[b] Shree Balaji Medical College and Hospital, Chromepet, Chennai, Tamil Nadu, India

Abstract
Diabetic nephropathy manifests as slowly progressive albuminuria with worsening hypertension and renal insufficiency. Diagnosis is based on history, physical examination, urine analysis and urine albumin/creatinine ratio. Sustained microalbuminuria is the earliest warning sign of asymptomatic diabetic nephropathy patients and is a potent risk factor for the development of progressive renal disease. Urine albumin creatinine ratio (ACR) is an accepted and useful screening test for microalbuminuria. Red blood cell distribution width (RDW) is a measurement of anisocytosis obtained in standard automated complete blood counts and is found to be an important clinical marker for diabetes complications independent of traditional risk factors and disease duration. The aim of the current study is to determine the relation between the albumin creatinine ratio level and the red blood cell distribution width. We have taken 49 diabetic nephropathy patients with 49 diabetic controls. We concluded our study by saying that RDW was found to be significantly associated with diabetic nephropathy patients and hence it may be a useful renal biomarker for diabetic complications. © protected.

Abstract
Time takes very important role in the field of Manufacturing. Taking less time for machining the workpiece without affecting the functional parameters is the attractive feature. Mechanism, Metal cutting tool take very important role in reducing the time for Machining. It is very clear in the case of Crank and Slotted link mechanism of shaper Machine, the time is reduced for return stroke (idle stroke) of the tool. So the total time for machining on the workpiece can be reduced. Here a specially designed tool takes less time for turning long workpiece. A special tool namely double point cutting tool takes lesser time than the time taken by the usual single point cutting for turning long workpiece. The specially designed HSS double point cutting tool is made to have double cutting points with height difference of 0.5mm and distance difference of 6 mm. Turning is carried out with depth of cut as 0.5mm by the first point and as well as by second point of the double point cutting tool. Investigation on feed force is made by using HSS double point cutting tool during turning of Aluminum Bar for different speed and feed rate and it is presented in this Research article. © 2016, International Journal of Pharmacy and Technology. Abstract
Man, Machine, Material and Method play very important role in the field of Manufacturing. The objective of this research paper is to reduce the time for turning a long workpiece and to study the surface roughness by choosing new Method of turning. Turning is the process of reducing the required diameter on the workpiece. Usually we use single point cutting tool for the same. Here this is the work where half of the total turning time is reduced by using a special tool namely double point cutting tool. The HSS double point cutting tool has two cutting points with height difference of 0.5 mm and the distance between them is 6 mm. Hence as the first point takes 0.5 mm depth of cut, the second point also takes 0.5 mm depth of cut as the tool proceeds for turning. So the half of the total turning time is reduced. Detailed study is made and presented on surface roughness after turning Aluminum bar of 50 mm diameter and 300 mm long work piece by using double point cutting tool for different speed and feed rate. © 2016, International Journal of Pharmacy and Technology. Abstract
The emergingtechnology requiresa large number of core to be integrated into a single chip.This had led to the development of System on Chip. SoC'shave paved way for large scale integration of electronics mounted on a single chip. SoC's are nowadays highly preferred for designing portable and compact devices with low power. The complex and complete integration of SoC has paved way for the concept of Network on Chip (NoC). NoC is a key challenge for power optimization as they are battery operated. In this paper survey provides a design of energy aware NoC with reduced power consumption and enhanced performance. A broad view of power optimization using voltage/frequency Island is provided. The paper also provides a detailed survey of the different data encoding techniques and their efficiency. The objective of this survey is to provide information regarding improved design for reducing power in NoCs. The survey also helps to arrive at a conclusion of the various power optimization techniques.

Abstract
Objective: This paper discusses and compares the various clustering methods over Ill-structured datasets and the primary objective is to find the best clustering method and to fix the optimal number of clusters. Methods: The dataset used in this experiment has derived from the measures of sensors used in an urban waste water treatment plant. In this paper, clustering methods like hierarchical, K means and PAM have been compared and internal cluster validity indices like connectivity, Dunn index, and silhouette index have been used to validate the clusters and the optimization of clustering is expressed in terms of number of clusters. At the end, experiment is done by varying the number of clusters and optimal scores are calculated. Findings: Optimal score and optimal rank list are generated which reveals that the hierarchical clustering is the optimal clustering method. The optimum value of connectivity index should be minimum, silhouette should be maximum, dunn should be maximum. So by interpreting the results, the optimal number of clusters for the experimental dataset have been concluded as K=2 and the optimal method for clustering the given dataset is hierarchical. Applications: The experiment has been done over the dataset derived from the measures of sensors used in a urban waste water treatment plant.

An improved hybrid algorithm for accurate determination of parameters of lung nodules with dirichlet boundaries in CT images

(2016) *Indian Journal of Science and Technology*, 9 (9), 8 p. Cited 3 times.

DOI: 10.17485/ijst/2016/v9i9/80313

Abstract
Background/Objectives: Segmentation of lung nodules with irregular boundaries in CT images remains a challenge. This work aims to advance the accuracy of segmentation using Random walker and watershed algorithm. Methods/Statistical Analysis: The input image is considered as a graph representing each pixel as a node. Two seed points which are userdefined (pre-labeled) pixels given as labels, one for the foreground and the other for the background. The gradient of the seed points are calculated. Then the probability of reaching the labeled pixels from each of the unlabeled pixels is obtained and a vector of probabilities is defined for each of the unlabeled pixels. Findings: The calculated vector of probabilities for each unlabeled pixel is combined and they can be assigned to one of the labels using the watershed algorithm to obtain tumor segmentation. We used 23 images for validating our method and our experiment compared the original random walker algorithm, random walker with improved weights and watershed segmentation results. Resulted images have maximum of DSC values as 0.92 for Random Walk, 0.94 for Random Walk with Improved Weight and 0.97 for Watershed combined. Applications/Improvements: Accurate segmentation of nodules with dirichlet boundaries in CT images using minimum number of seed points.

Abstract
Lung cancer is the most common disease with greater morality rate. Computed Tomography (CT) images are used for early diagnosis of lung cancer with the help of CAD system. Selection of effective feature set and proper classifier for medical images where machine learning techniques are used is a challenging task. Texture analysis of computed tomography (CT) images is one of the important preliminary stages in the detection and classification for lung cancer. The image texture is characterized by Haralick texture with variety of statistical measures. The extracted texture feature values are used by a CAD to differentiate its type as benign or malignant. This paper aims to compare experimental results of 18 features extracted by using Gray Level Co occurrence Matrix (GLCM) and analyses the different classifiers that can be used for classification of nodule as benign or malignant. Measuring the statistical parameters of the nodule is crucial for determining the T stage of the nodule. This paper also analysis the statistical parameters and reported the contribution of minimal feature set for classification and staging. GLCM features are used for classification and Geometric features used are used for T staging. For these analysis 23 images dataset of different types of cancer is used. © 2006-2016 Asian Research Publishing Network (ARPN).

Electrodeposition of Nickel on Glassy Carbon Electrode from Protic Ionic Liquids with Imidazolium Cation

(2016) *Journal of Inorganic and Organometallic Polymers and Materials*, 26 (2), pp. 423-430. Cited 7 times.

DOI: 10.1007/s10904-016-0329-3

Abstract

The electrodeposition of nickel (Ni) on glassy carbon electrode was performed in a variety of six imidazolium based protic ionic liquids (PILs) like 2-methylimidazolium lactate ([Hmim][lactate]), 1-ethylimidazolium lactate ([Heim][lactate]), 1-butylimidazolium lactate ([Hbim][lactate]), 2-methylimidazolium glycolate ([Hmim][glycolate]), 1-ethylimidazolium glycolate ([Heim][glycolate]), 1-butylimidazolium glycolate ([Hbim] [glycolate]), respectively at various concentrations. While examining the course of the deposition process using cyclic voltammetry, the results demonstrate that all PILs possess high electrochemical stability with good electrochemical window ranging 1.61–3.6 V. In addition, [Hmim][lactate] and [Hmim] [glycolate] showed greater cathodic stability, due to the replacement of C-2 acidic proton in imidazolium cation with methyl group. The Ni electrodeposition is found to be proceeding via one step—two electron transfer process that involved the irreversible reduction of Ni (II) to Ni (0). Also, it was found that by increasing Ni (II) concentration, nickel electrodeposition becomes more facile. Moreover, it was observed that owing to their high ionic conductance, the Ni electrodeposition was more facile in [Hmim][lactate] and [Hmim][glycolate] with diffusion co-efficient 1.8 × 10−5 and 5.1 × 10−7, respectively. The electrodeposited Ni was characterized using scanning electron microscope (SEM) and energy dispersive X-ray (EDX) analysis. The distinctive uniform,sponge and gravel-like morphologies of Ni deposits were confirmed by SEM images and the EDX analysis endorse the presence of Ni element. © 2016, Springer Science+Business Media New York.

Optimized fast handover using TBU scheme for PMIPv6 based network mobility
(2016) *International Journal of Applied Engineering Research*, 11 (2), pp. 944-949. Cited 2 times.

[a] Department of Computer Science and Engineering, Easwari Engineering College, Chennai, TN, India
[b] Bharath Uuniversity, Chennai, TN, India

Abstract
The Internet Engineering Task Force proposed a host-based mobility management protocol, called Mobile IPv6 for mobile nodes to maintain continuous service when they move to a foreign network but causes long disruptions during handover. Hence a new scheme is proposed based on PMIPv6 and EfNEMO to mitigate packet loss, signaling problem and handover latency. This scheme ensures that the MN maintains the same Home Network Prefix in the localized domain and the current location of the MN is stored in Home agent and pre-registration of MN location is performed. This work is being carried out using the Network Simulation tool OMNeT++ 4. 0. © Research India Publications.

Size-controlled synthesis of chalcogen and chalcogenide nanoparticles using protic ionic liquids with imidazolium cation

(2016) *Korean Journal of Chemical Engineering*, 33 (3), pp. 934-944. Cited 18 times.

DOI: 10.1007/s11814-015-0224-6

Abstract

Green synthesis of selenium (chalcogen) nanoparticles (SeNPs) has been successfully attained by simple wet chemical method that involves the reaction of six different protic ionic liquids with imidazolium cations and sodium hydrogen selenide (NaHSe) in the presence of poly ethylene glycol-600 (PEG-600) as an additional stabilizer. The obtained SeNPs were characterized using UV spectral (UV), Fourier transform infra-red (FT-IR), X-ray diffraction (XRD), thermogravimetric analysis (TGA), differential thermal analysis (DTA), scanning electron microscope (SEM) with energy dispersive X-ray (EDX) and high resolution transmission electron microscope (TEM) analysis. The results illustrate that the synthesized SeNPs are spherical in shape with size ranging 19-24 nm and possess good optical property with greater band gap energy, high thermal stability up to 330 °C, low melting point of 218-220 °C comparing to precursor selenium. Using the synthesized SeNPs, two chalcogenides such as ZnSe and CdSe semiconductor nanoparticles were synthesized and characterized using XRD, SEM with EDX and TEM analysis. The fabricated CdSe and ZnSe nanoparticles appeared like pebble and cluster structure with particle size of 29.97 nm and 22.73 nm respectively. © 2016, Korean Institute of Chemical Engineers, Seoul, Korea.

Abstract

This contribution reports on the synthesis and the main physical properties of p-type NiO nanoparticles synthesized for the first time by a completely green process using Agathosma betulina plant extract as an effective oxidizing/reducing agent. The surface/interface and volume room temperature properties by TEM, EDS, XRD, FTIR, Raman and photoluminescence as well as XPS are reported. Likewise, a standard blade made film of pressed n-type NiO nanoparticles onto p-type Silicon substrate of such nanoparticles exhibited a good photodiode response in the NIR spectral range. © 2015 Elsevier B.V.

Abstract

Manganese doped nickel ferrite (MnxNi1−xFe2O4: x = 0.0–0.5) spinel nanoparticles (NPs) were successfully prepared by a facile microwave combustion method (MCM) using urea as the fuel. The prepared samples were characterized by different techniques. Powder X-ray diffraction (XRD) analysis was confirmed the formation of a single-phase NiFe2O4 spinel structure. The average crystallite sizes of the samples were in the range of 11.49 to 17.24 nm, which was confirmed by Sherrer's formula. The morphology of the samples showed a nanoparticle-like structure with smaller agglomeration, which was confirmed by high-resolution scanning electron microscopy (HR-SEM). The particle size diameter ranges from 15 to 20 nm, which was confirmed by high-resolution transmission electron microscopy (HR-TEM). Energy dispersive X-ray (EDX) analysis confirmed the elemental composition, which was also evidence for the formation of single pure phase. Selected area electron diffraction (SAED) analysis showed well crystalline nature. UV-visible diffuse reflectance spectra (DRS) and photoluminescence (PL) spectrum analysis was used to calculate the optical band gap, and the values are slightly increased (2.02 to 2.42 eV) with increasing the Mn-dopant, due to the decreasing of particle size, which may be due to the quantum confinement effect. Magnetic properties of the samples were analyzed by vibrating sample magnetometer (VSM) technique, which showed the magnetization (Ms) value of the samples are increased with increasing Mn content and reach a maximum value of 67.82 emu/g for Mn0.5Ni0.5Fe2O4 sample. Photo-catalytic activity of the samples was measured and showed the photocatalytic degradation (PCD) of methylene blue dye with good results. The catalyst was magnetically recycled and reused five consecutive cycles and showed good reproducibility without change of catalytic activity. © 2015, Springer Science+Business Media New York.

Abstract
The first time synthesis of CdO nano-crystals by green chemistry process based on Hibiscus Sabdariffa flower extract and their main physical properties are reported. While it is shown that the natural extract acts as an effective chelating agent in facilitating the formation of the CdO nanoparticles, the structural analysis by X-rays diffraction analysis shows that the nano-crystals exhibit a pure single phase Monteponite. Their photoluminescence display a relatively an intense and narrow emission peak at 551 nm. Their direct and indirect bandgaps were found to be 2.7 and 2.1 eV. The investigation of their surface properties showed the existence of a double coordination: presence of CdO and CdO2 type bonds. The current-voltage characteristic of the CdO nanoparticles film/c-Si heterojunction solar cell under dark and illumination conditions showed that such a heterojunction has acceptable rectification characteristics with a forward current saturating at ~1 V. © 2015 Elsevier B.V. Substance use disorder and the family: An Indian perspective
(2016) *Medical Journal of Dr. D.Y. Patil University*, 9 (1), pp. 7-14. Cited 12 times.

DOI: 10.4103/0975-2870.172413

Abstract
The substance use disorder not only impacts the patient himself/herself, but also affects family members. This is more relevant in a country like India where the familial ties are stronger withfamily members playing a significant role in the treatment process. This narrative review takes an overview of the inter-relationship between substance use disorder and the family. The domestic violence and adverse familial circumstances, both often arise as a consequence of substance use. Although the spouses of substance users experience greater rates of psychopathology and distress, children of patients with substance user disorders demonstrate higher levels of behavioral disturbances. Codependence often develops in the familial relationship, which perpetuates the substance use disorder. Substance use places quite a burden on the family, both psychologically as well as in terms of resources. Nonetheless, family members provide motivation, emotional support, and practical help during the treatment of substance use disorders and hence need to be engaged in the therapeutic process. Finally, the changing family structure and family dynamics in India might influence the in the future both the effect of substance use disorder on the family, and the familial resource availablefor treatment. © 2016 Medical Journal of Dr. D.Y. Efficient and parallel data processing and resource allocation in the cloud by using Nephele's data processing framework

(2016) *International Journal of Grid and Distributed Computing*, 9 (3), pp. 33-40. Cited 2 times.

Abstract

Cloud computing is a technology in which the Cloud Service Providers (CSP) provide many virtual servers to the users to store their information in the cloud. The faults occurring on the assignment and dismission of the virtual machines, the processing cost in the allocation of resources must also be considered. The parallel processing of the information on the virtual machines must be done effectively and in an efficient manner. A variety of systems were developed to facilitate Many Task Computing (MTC). These systems aim to hide the issues of parallelism and fault tolerant and they are used in many applications. In this paper, we introduced Nephele, a data processing framework to exploit dynamic resource provisioning offered by IaaS clouds. The performance evaluation of the virtual machines has been evaluated and the allocation and deallocation of job tasks to the specific virtual machines has also been considered. A performance comparison with the well known data processing framework hadoop has been done. Thus this paper tells about the effective and efficient manner of processing the data by parallel processing and allocating the correct resources for the desired task. It also helps to reduce the cost of resource utilization by exploiting the dynamic resource utilization. © 2016 SERSC.

Abstract

Cloud computing is a facsimile of legalizing ubiquitous, expedient, on-demand network access to a shared pool of configurable computing resources that can be rapidly furnished and released with negligible management effort. It relies on sharing computing resources rather than having local servers or personal devices to handle applications. The resource allocation, still lack on sustaining tools that enable developers to compare different resource allocation strategies in cloud computing. In this paper we initiate the concept of “skewness” to measure the bumpy utilization of a server. By minimizing skewness, we can improve the overall utilization of servers in the face of multidimensional resource constraints. Here we use skewness metric to combine VMs with different resource characteristics suitably so that the capacities of servers are well utilized. © 2016 SERSC.

Effective grade planning and instant cloud storage provisioning
(2016) *International Journal of Applied Engineering Research*, 11 (9), pp. 6648-6650.

[a] Dept of Computer Science Engineering, Bharath University, Chennai, Tamil Nadu, India

Abstract
The circulation of Cloud Service push the increasing demands of storage resources to the service vendors like Amazon, IBM, Google and etc,. Along with the talented business opportunities, this project brings new technique challenges such as effective grade planning and instant cloud storage provisioning. To ensure the correctness of user's data in the cloud, we suggest an effective and flexible distributed scheme in which we overcome the problem of secure Graded keyword search over encrypted cloud data. By utilizing the Graded search improves the system usability by enabling search result relevance ranking instead of sending undifferentiated results, and then it will further ensures the file retrieval accuracy and also improving the service quality for the capacity planning and instant cloud resource provisioning problem. Unlike most prior works, the new scheme further supports secure and efficient dynamic operations on data blocks. Extensive security and performance analysis shows that the proposed scheme is highly efficient and resilient against malicious data modification attack, and even server colluding attacks. Our Analytics method can significantly improve the service quality by reducing the resource provisioning time while maintaining a low cloud overhead. © Research India Publications.

Gemination or fusion?: A case report

(2016) *Biomedical and Pharmacology Journal*, 9 (3), pp. 1225-1228.

DOI: 10.13005/bpj/1071

Abstract
Gemination and fusion are the most commonly encountered anomalies in dental practice, and distinction between the two is always challenging. Fusion is when two tooth buds fuse to make a large tooth. Gemination, also called double tooth is an anomaly exhibiting two joined crowns and usually a single root. It represents an incomplete attempt of a single tooth germ to split. It is considered multifactorial in etiology, with genetic and environmental causes. It is extremely difficult to differentiate between fusion and germination especially when a supernumerary is attached with the adjacent tooth. This paper highlights the importance of diagnosing developmental anomalies of teeth and the proper treatment outcome of these abnormalities.

Efficacy of organic component on hardness and fracture toughness of human dentin using heat treatment - in vitro study

(2016) *Biomedical and Pharmacology Journal*, 9 (3), pp. 1101-1105.

DOI: 10.13005/bpj/1055

[a] Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath University, Chennai, Tamilnadu, India

[c] Department of Conservative Dentistry and Endodontics, Faculty of Dental Sciences, Sri Ramachandra University, Chennai, Tamilnadu, India

Abstract

The study was performed to find the influence of organic matrix on hardness and fracture toughness of the human dentin. The mid-sagittal sections of the dentin were subjected to Vickers hardness testing after removal of organic component from dentin by heat treatment. The heat treatment temperature for human dentin was determined as 800°C by the rmogravimetric analysis in order to facilitate complete removal of organic component. The removal of proteins from dentin was confirmed by Fourier transform infrared spectroscopy. The significant difference in hardness and fracture toughness values was found among the heat treated and untreated dentin ($p<0.001$).This study confirms the role of organic component of dentin on mechanical properties. Thus, helps in research and development of novel reparative materials.

Effects and molecular mode of action of noni (Morindacitrifolia) juice and its active components
(2016) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 7 (2), pp. 2153-2162.

[a] Department of Prosthodontics, Madha Dental college and Hospital, Bharath University, Chennai, India

Abstract
Morindacitrifolia, also known as noni belongs to the family Rubiaceae has been in high demand in yurvedic medicine. It has been used long since in various cultures as a medicine for cure of various ailments. This review attempts to analyze the evidence for the claim as a therapeutic cure for many diseases. This review article is presented to compile all the updated information on its phytochemical and pharmacological activities. Studies indicate fruit juice possesses antioxidant, anti-inflammatory, apoptotic and anticancer, properties. Various effects like antibacterial, anti-fungal, anti HIV, antiboneresorption, antispasmodic, antipyretic, anti-diarrheal, anti-allergic, immunomodulation, cardiotonic, hypo-lipidemic, anti-microbial, gastro-protective have been studied. Clinical trials using this fruit juice for a variety of conditions should also be conducted. Currently the market is flooded with products with claim cure for all ailments. This review analyzes the beneficial effects of the use of Morinda Citrofolia. Evidence based result shows that consumption of noni could be beneficial both protective and curative.

Search result based web personalization using XML data with RPSO clustering algorithm
(2016) *International Journal of Control Theory and Applications*, 9 (36), pp. 281-289.

[a] Research Scholar, Bharath University, Selaiyur, Chennai, India

Abstract
Internet is seen to have acquired the status of essential element in the lives of people. Applying the process of data mining for discovering knowledge out of data from web such as the web pages, hyperlinks, and web documents is called as web mining. Problem with the existing system is that execution time is more for the grouping process while the accuracy of retrieval of document from web is also not efficient. In addition to these two issues, the present system does not also focus on the role or domain-based search. Apart from these, search results retrieved are also not annotation result or according to users preference. The above stated are the primary issues with the present system which makes use of XML database. For overcoming the said issues, in our analysis, we have proposed a Partial Swarm Optimization (PSO) technique for grouping process. In addition to the process of clustering, this study also suggests three different types of processing that have been listed below: Registration using user role, Extracting XML data by making use of tokenization, Clustering process using enhanced annotation label. Among these, in the first procedure, role will be defined prior to retrieval of search result out of the XML database. Secondly, this will help extract data out of the XML database by tokenization, and finally, group the (SRR) Search Result Records. In the process of clustering, focus is on two vital factors, the first one being attributes- that is, keywords, and the second one happens to be user role. Moreover, the process of rating-based ranking has been included for retrieving user preference results. In our proposed system, the time for the process of clustering is better when compared with the present system. In the end, we have also proposed one ranking procedure for the user preference. © International Science Press.

Automatic detection of synchronous multiple primary lung cancer in lung ct images using pml techniques
(2016) *International Journal of Control Theory and Applications*, 9 (24), pp. 349-355.

[a] SRM University, Chennai, Tamilnadu, India

Abstract
Lung cancer growth is classified into 4 stages based on T, N and M descriptors. Stage I corresponds to the initial stage and stage IV corresponds to the final stage of the lung cancer. Identifying the stages of the lung cancer is vital as treatment as treatment is based on the stage. Stage IV is termed as Metasis stage where the cancer spreads from one organ to another organ in the human body. Synchronous multiple primary nodules may correspond to the metasis stage of the lung cancer. In this paper we are presenting scoring method, a pixel based machine learning (PML) technique for identifying possible metasis stage of the cancer with the property that the nodules extended from one lung region to another or having multiple malignant nodules. The proposed method is tested with 8 patients with a total of 86 nodules. We observed 87.2% of accuracy in the results. © International Science Press.

Radiological assessment of age from wrist joint in young adolescents
(2016) *Journal of Indian Academy of Forensic Medicine*, 38 (2), pp. 149-151.

DOI: 10.5958/0974-0848.2016.00038.5

Abstract
It's a radiological study of age assessment of 100 cases of young adolescents (Boy = 50; Girl = 50) in the age range of 14-17yrs by taking A-P view X-rays of their right wrist joint including hands. There was not a single case of fusion of lower end of ulna in male under the age of 14yrs. Fusion of lower end of radius is late in both sexes and we don't find any fusion in boys up to the 16yrs of age. It was observed that there is considerable narrowing of the range of radiological age assessed using the x-ray of the hand, from 15 years - 19 years to 14 years - 17 years in both boys and girls. The present study emphatically reveals that an adolescent either boy or girl whose secondary ossification centres of base of first metacarpal, heads of second, third, fourth and fifth metacarpals, bases of phalanges have fused could have attained the age of 17 years. This finding is quite reasonably consistent with the age from the available date of birth certificates of these students.

Abstract
Background: Non-invasive methods for screening and diagnosis are the field with fast growing interest which leads to various biological signal measurements like Photoplethysmogram (PPG) and pressure pulse. PPG monitoring is widely used in the healthcare as this single pulse study can provide wide physiological information non-invasively such as oxygen saturation, heart rate, blood pressure (continuous and cuff less), blood volume, arterial stiffness and respiration rate. First and second derivatives of PPG provide important information about the arterial stiffness and vascular health of the person. Aim: This paper explains the design and development of prototype with RED LED (660 nm) and IR LED (860 nm) as a source and OPT 101 as a detector. Second derivative related indices of PPG (for RED LED and IR LED) were calculated. Materials and methods: Study was carried out on 15 healthy female subjects without any known history of blood pressure and blood glucose; aged between 19-23 years. Results and conclusion: Amplitude of PPG obtained from RED LED is smaller than the amplitude of PPG obtained from IR LED. Comparative analysis of first and second derivative of the PPG obtained from RED light source and IR light source is discussed by the authors. It was observed that various parameters studied from second derivative are the 'Normalized Values', so effect of change in the amplitude of the PPG signal obtained from RED LED and IR LED get nullified in this study (P>0.05). Though IR source based reflective type of sensor related study can be useful in future for the brain vascular health assessment. © 2016, Scientific Publishers of India. All rights reserved.

Abstract
PPG (photoplethysmography) sensors are capable of measuring blood volumetric changes in the subcutaneous vessels. The transmission type of measurement is limited to only a few specific positions whereas the reflectance type of PPG sensor can be easily applied on various parts of the body surface. To determine the quality of reflectance type photoplethysmography signal, various parameters are analysed like the source-detector distance and the source wavelengths (660 nm and 860 nm). The experimental set up for light reflectance measurement is surface mount light-emitting diodes (LEDs) with two different wavelengths (660 nm and 860 nm) of light were tested in the experiment and by varying the distance between the source and the detector. The excitation signal used for LED is AC varying from range of 300 kHz and above and analysing the advantages as compared to DC excitation. Detector used is OPT101. The work in this paper analyses systolic amplitude (SA) using MATLAB for two wavelengths 660 nm and 860 nm. The sensors are designed for two distances, 1 cm and 1.5 cm respectively. Observations were taken for two different wavelengths with two different distances for 10 females in the age group 20 to 50 years. The results show that SA amplitude decreases as the source and detector distance increases. In Paired t-test using Minitab 17, the mean of SA of PPG signal acquired with a distance of 1 cm between the source and detector was observed to be greater than the mean of SA of PPG signal which was acquired with a distance of 1.5 cm ($p<0.1$). Systolic amplitude of 860 nm for oxy-Hb is greater than 660 nm for deoxy-Hb, so we concluded that the system can be used for measurement of concentration change in deoxy-Hb and oxy-Hb due to increase in blood during brain activity. © 2016, Scientific Publishers of India. Abstract
For day today life photography is becoming very popular. In every fields of work, official or personal, the task of securing the image is challenging against the advancement of the technology. The concept of watermarking gives comfortable solution for the copyright protection. Different Wavelet transforms are considered with its mean square error and peak signal to noise ratio. The Haar, Biorthogonal, Daubechies wavelets are used for simulation to find better peak signal to noise ratio. Watermarking is done on these transforms and its robustness is found for the color image.

Abstract
Classifying the genes in line with the organic phenomenon information. Analysis: There are many techniques and algorithms are used for extracting the hidden patterns from the big information sets and finding the relationships between them. Clump (of information of knowledge of information) is one among the vital techniques in huge data. Clump algorithms are used for grouping the information things supported their similarity. Findings: Big Data is that the method of analyzing information from completely different views and summarizing it into helpful data. Polymer small array technique has involved nice attention in each the scientific and in industrial areas. The new supervised clump algorithmic program eliminates the redundancy between two or many attributes. Apply Min HASH clump algorithmic program to cluster the sequence of sequence information expressions. The simplest way to systematically sample information from large set of data and that could be a technique for quickly estimating of comparable two different information sets. Application /Improvements: This clump algorithmic program uses hash intersections to probabilistically cluster similar information. So as to seek out the duplications within the information it conjointly utilizes the similarity menstruation. Small array technology classifies the genes in line with the organic phenomenon information. a replacement quantitative live incorporates the data of sample genes and it measures the similarity between two teams of genes. This can be referred to as attribute based mostly clump. © International Science Press.

Abstract
Web Usage Mining is that area of Web Mining which deals with the extraction of interesting knowledge from logging information produced by Web servers and apply that knowledge in specific field to enhance the usability of that field. In this paper we present a survey of the recent developments in this area that is receiving increasing attention from the Data Mining community. Also we have deployed the obtained knowledge towards the application area of traffic analysis in order to predict and forecast the traffic updates to the users. © International Science Press.

Rewriting of DNA-RNA by applying indexed grammar with Cnf & GNF
(2016) *International Journal of Control Theory and Applications*, 9 (28), pp. 21-30.

Abstract
The term RNA-Editing describes a wide range of innovative mechanisms used for modifying nucleotide cycles pertaining to RNA transcripts present in various organisms. The main proposal is to develop indexed insertion deletion system in bio-inspired computing. Methods: Two generic models of nucleotide modification are included in the phenomenon, insertion/deletion and replacement, described according to whether the cycle of modified RNA happens to be collinear with DNA cycle which encodes that. RNA editing may be mediated through a range of pathways which are evolutionarily and mechanistically not related. We are considering two basic types in string rewriting known as assisted insertion/ deletion and next, the assisted rewriting. Original str ings might be edited in accordance with the particular match with any given group of supplementary strings, knows as guides. Assisted insertion/deletion will consider pairing some string and guide in relation to a particular string correspondence. Assisted rewriting will consider pairing a guide and string in relation to some equivalence connection on an alphabet. Assisted insertion/deletion has been inspired by the RNA-editing, which is one biological process through which the authentic genetic data that is saved in DNA is changed prior to its ultimate expression. Findings: A correspondence related to slice cycles is established and we assist rewrite cycles within a Grammar that is Context Free (CFG). Due to their left-to-right arrangement, slice cycles happen to be very convenient in dealing when compared with assisted rewrite cycles pertaining to construction of finite automata which we will encounter in proofs for regularity. Our proposed method CNF and GNF having indexed grammar produces improved and satisfactory result in rewriting (insertion/deletion) procedure. © International Science Press.

Abstract
This paper discusses the optimization of clustering over ill-structured datasets. The dataset used in this experiment has derived from the measures of sensors used in a urban waste water treatment plant. The objective of this experiment is to categorize the quality of water from the treatment plant. Water Quality is indicated by the following parameters: Suspended Solids(SS),Biological Oxygen Demand(DBO),Chemical Oxygen Demand(DQO), Sediment(SED),Conductivity(COND). In this paper K-means algorithm is used for clustering the data set. The optimization of clustering is discussed in terms of number of clusters which results in a natural categorization of the dataset based on the quality parameters of the water. K-Means was chosen for its simplicity and efficiency. Moreover K-Means algorithm is the best suitable algorithm for clustering numerical datasets. © International Science Press.

Abstract
Nanoengineered biomaterials have tremendously improved the range of tools utilized for the control of as well as acceleration of healing of diabetic foot ulcers (DFU) over the last few decades. Despite nanoparticles and electrospun nanofibers being used extensively for the treatment of DFU, there has been no review available till now which addresses the utilization of the latest nanodelivery techniques along with modern electrospun nanofiber treatments for DFU. This review thoroughly summarizes the latest mindboggling findings of potential nanomaterials like polymeric and metallic nanoparticles and electrospun nanofibers for DFU treatment. In addition, a succinct insight into the potential of the aforementioned nanomaterials which can be exploited as therapeutic delivery agents for improving the regeneration of damaged dermal and epidermal tissues of DFU is underscored. Ultimately, current challenges and future prospects of nanoparticles and electrospun nanofibers for DFU treatment are highlighted. © The Royal Society of Chemistry.

Abstract
Background and Objectives: Morinda citrifolia (Noni), an important traditional medicinal plant still used in patients with bone fractures or dislocation to promote connective tissue repair and to reduce inflammation. However, the effects of Noni on bone metabolism and whether it influences the osteogenic differentiation is yet to be clarified. In this study, we investigated the effect of Morinda citrifolia (Noni) juice on the proliferation rate of rat bone marrow derived mesenchymal stem cells (BMSC) and the osteoblastic differentiation as shown by alkaline phosphatase (ALP), Runt-related transcription factor 2 (Runx2) and osteocalcin (OCN) mRNA expression in vitro. Methods and Results: Treatment with 200 μg/ml Noni juice enhanced the proliferation rate of the BMSC and also upregulated the osteogenic differentiation marker genes ALP and OCN, and Runx2 measured by RTPCR. Consistent with these results collagen scaffolds implanted in vivo, which were loaded with BMSC pre-exposed to Noni, showed increased bone density measured by computed tomography and histological analysis revealed neo-angiogenesis for bone formation. Conclusions: These results suggest that Noni stimulates osteoblastogenesis and can be used as adjuvant natural medicine for bone diseases such as osteoporosis.

Author Keywords
Alkaline phosphatase; Bone marrow derived mesenchymal stem cells; Morinda citrifolia; Osteocalcin; Runt-related transcription factor 2

Identifying the impact of semantic similarity in semantic social media through evolving term for effective web mining

(2016) *Indian Journal of Science and Technology*, 9 (44), art. no. 101133, .

DOI: 10.17485/ijst/2016/v9i44/101133

[a] Department of Computer Science and Engineering, Bharath University, Chennai, Tamil Nadu, 600073, India

Abstract
Objective: Computing semantic similarity is a significant objective in Information Retrieval (IR) due to the emerging web searching process and the demand of fast and efficient result provisioning. Methods: Exploiting static lexical resources leads most of the conventional semantic similarity measurement techniques to ignore temporal aspects of concepts. Later, to resolve the temporal constraint, the research works exploit independent sources like Newspaper articles, television documentaries, and books. However, these methods meet the data-sparsity problem, since the independent sources are too restrictive and exclude articles that are worthy of notice. Findings: In order to provide the precise result for recent trend concepts, this paper utilizes the social media as the robust and dynamic source, often reflect public opinion. This work introduces an ideNtifying nEw concept Evolution thRough semantIC Social media temPoral analYsis (NEOTERICSPY) model incorporating two phases, namely semantic relatedness measurement in a time series and examining temporal fluctuations between time series. Initially, the NEOTERIC-SPY measures the semantic relatedness of a word-pair using normalized distance measurement in a time series and facilitates the identification of temporal fluctuations. It reduces the word-pair list of a concept among the overall possible word-pairs and provides a good trade-off between the execution time and accuracy. Secondly, it identifies the new concepts using temporal correlation analysis of the semantic similarity measurement between the time series. It employs the weighing function of the temporal dynamics to find the recent changes than the ancient changes of the concepts. The experimental results show that the NEOTERIC-SPY approach significantly outperforms the conventional method and illustrates the consistent improvements of its performance. Application/ Improvements: The NEOTERIC-SPY leads the IR system to provide the desired information to the users in a short-time period, ensuring the precise result pertaining to the recent concept.

Abstract
Security and privacy concernsare shown to be the primary obstacles to a wide adoption of clouds. The new concepts that clouds introduce, such as multi-tenancy, resource sharing and outsourcing, create new challenges to the security community. Security has become the greatest obstacle and booming revolution in Cloud Computing, which occupies the top concern in the minds of the researchers. In this paper provide a comprehensive method of cloud computing security and privacy concerns and identify cloud vulnerabilities, classify known securitythreats and attacks, and present the state-of-the-art practices to control the vulnerabilities, neutralize the threats, and calibrate the attacks.Cloud Computing is the master of IT services, providing platform for delivering the requirements on demand and paid based on the service accessed over the internet.It is the paradigm which cannot be resolved for its unimaginable activities; this allows users to make use of an application at any location or devices. Confidentiality, Integrity, Privacy of the data residing in cloud storage is the concern that is yet to be solved. So, a lot of research activities is been prompted by these issues, aiming to cover the pitfalls of the security leaks.This paper exaggerates the vulnerabilities that occur maintaining in the data integrity and a proposed model to protect the user data in a shared pool of computing resources and also we converse here on spotting the major vulnerabilities in this type of structures and the largest part of essential threats found in the literature related to vulnerabilities and threats with probable elucidation. © International Science Press.

Flexural response of fibre reinforced polymer laminated pre-stressed concrete beams

(2016) *Indian Journal of Science and Technology*, 9 (42), art. no. 101824, . Cited 15 times.

DOI: 10.17485/ijst/2016/v9i42/101824

Abstract
Objectives: To examine the effect of Glass Fiber Reinforced Plastic (GFRP) laminated on strength and deformation capacity of pre-stressed concrete beams under static loading condition. Methods/Statistical Analysis: In this study, 7 Pre-Stressed Concrete (PSC) beams were cast and laminated with GFRP. The beams were tested under monotonically increasing loading and manual readings were recorded. Sufficient data was obtained on the strength, deformation and failure characteristics of pre-stressed beams with and without GFRP laminates for beams tested under static loading. Findings: In all the pre-stressed concrete beams, 5mm UDCGFRP strengthened PSC beams showed an improved flexural strength. The test results inferred that strengthened pre-stressed concrete beams showed 93.15% increase in load carrying capacity than that of control specimens. All GFRP laminated pre-stressed concrete beams experience flexural failure.
Application/Improvements: The pre-stressed concrete beams laminated with glass fibre reinforced polymer were found to be very effective in load carrying capacity, deflection and ductility. It can be also be suitably adopted for rehabilitation and restoration of corrosion damaged, old infrastructures and seismic affected concrete structures.

Abstract
Objectives: The implementation of an Industry neutral architecture for an analysis on Big Data in the Internet of Things Platform. Methods/Statistical Analysis: The Outside temperature, Light and Humidity from weather station is monitered in dashboardand analyzed in ThingSpeak - Internet of Things Platform. The analysis on weather station data is performed using Matlab in ThingSpeak - Internet of Things Platform. Findings:To do a real time analysis of weather station data using ThingSpeak - Internet of Things Platform. Real time tracking of the attributes include dew point, temperature and humidity from the Arduino Sensor device which is installed on Weather Station. Application/Improvements: Internet of Things Platform broad network access allows investors/stakeholders to visualize the output of Data Presentation (Data Analytics, Data Visualization, BI reporting), easily from multiple locations and platforms, which can facilitate enterprise decision making and here we recommend solutions for the security and privacy issues in the Internet of Things Platform.

Meta path based Top-K Similarity join in heterogeneous information networks
(2016) *Journal of Chemical and Pharmaceutical Sciences*, 9 (4), pp. 2217-2220.

[a] Computer Science and Engineering, Bharath University, India
[b] C.Abdul Hakeem College of Engineering and Technology, Computer Science and Engineering, Melvisharam, India

Abstract
Heterogeneous information networks (HINs) has received growing attention in a newly emerging network model. Clustering, classification and similarity search are the data mining tasks explored in HINs. Similarity join operation is required for many problems which is attracting attention from various applications on network data which includes friend recommendation, link prediction and online advertising. Similarity join is studied in homogeneous network but not studied in heterogeneous networks. The heterogeneity of the HINs are ignored completely by the previous research on similarity join which takes different semantic meanings. A Meta-Path-based Similarity join (MPS-join) method to return the top k similar pairs of objects based on the user specified join path in a HIN is proposed and to prune expensive similarity computation by using BPLSH (Bucket Pruning based Locality Sensitive Hashing) indexing. When compared to the existing Link-based Similarity join (LS-join) method, this MPS-join method derives various similarity semantics. The experimental results on real data sets shows the efficiency and effectiveness of the proposed approach.

Abstract
Titanium (Ti) and Ti-based alloys are the best promising orthopaedic metal transplants. The Young's modulus of Ti and bone are nearer and so Ti implants are known as osseointegrated implants. However, the need for enhancing the osseointegration, corrosion resistance and biocompatibility cannot be ruled out in promoting the Ti as a golden standard. This review describes various surface modifications like acid etching, sand blasting, surface coating, alkali-heat treatment, plasma treatment and ion implantation of Ti-based implants which are the best solutions to promote biocompatibility, osseointegration and ultimately the longevity of implants. In addition, it gives an outline to accomplish the risky task in orthopaedics like recovering skeletal function by replacing the damaged bone for human being survival and it will assist the energetic collaboration of specialists in materials science, chemistry and biology for the quality enhancement.

PEGASIS: Energy harvesting in sensor networks

(2016) *International Journal of Control Theory and Applications*, 9 (9), pp. 3981-3987.

[a] Department of Computer Science and Engineering, Vel Tech Multi Tech Dr.Rangarajan Dr.Sakunthala Engineering College, Chennai, Tamilnadu, India
[b] Department of Computer Science and Engineering, Bharath University, Chennai, Tamilnadu, India

Abstract
To collect the valuable information, we use sensor web which consists of nodes with limited battery power and wireless communication. This problem in sensor network is managing energy in an efficient manner. This paper proposes a new power efficient protocol named PEGASIS. This protocol works with neighboring nodes, which sense the data and randomly chosen nodes will take its turn to communicate with Base station. It assumes that BS is establishing from the sensor node at far distance. All nodes information has maintained by database, which stores the location of all other nodes. This makes the protocol robust to failures. We have compared the Energy Efficient level from existing mechanism to proposed mechanism. Finally our system is minimizing energy consumption and further to prolong network life and to achieve energy efficiency. © International Science Press.

A study on the classification of water quality, pazhayar river basin, kanyakumari district, through aggregation of water quality index

(2016) *Indian Journal of Environmental Protection*, 36 (1), pp. 59-68.

[a] R.M.K. College of Engineering and Technology, Department of Civil Engineering, Puduvoyal Chennai, 601 206, India
[b] Department of Civil Engineering, Government Engineering College, Salem, India
[c] Bharath University, Chennai, India

Abstract
The river Pazhayar originating from the slopes of Mahendragiri hills at an altitude of 800 m above M.S.L., flows towards south-western direction through Mahendragiri Estate, Palkulam, Bhuttapandi, Thazhikudi, Nagercoil town, Suchindram, etc., and joins the Arabian Sea near Manakudi. The basin contains number of water storage tanks/bunds. The catchment area of the river is 397 km2. The total length of the river is 40 km. There is one CWC Hydrological Observation Station at Ashramam on this river. The early kings also constructed about 11 check-dams along the course of the river. A Venad ruler, Boothala Sree Veera Udaya Marthandavarma, who ruled this area in 1517, constructed the Veerapuli dam and its canals. But, unfortunately, the dam was destroyed by a flood 40 years ago. Another major problem faced by the Pazhayar is pollution. Though the river water is free from pollution from Surulacode to Putheri, the stretch from Putheri to Suchindrum is highly polluted. Sewage from Putheri and Nagercoil also flows into the river. The sewage (household sewage, solid waste and liquid waste from hospitals) from Putheri area drain into the river at Putheri and sewage from Nagercoil is let into the river between Vadaserry - Ozhuginaserry - Edalakudi. A study was undertaken during the month of June 2015 to November 2015 (south west and north east monsoon period) and evaluates the water quality of Pazhyar river. The study involves the physical and chemical and analysis, like turbidity, electrical conductivity (EC), total dissolved solids (TDS), pH, total alkalinity (TALK), total hardness (TH), Ca, Mg, Na, K, Fe, Mn, Cl, F, NH3,NO2, NO3, BOD and DO of river. The results of the present study have been compared with the permissible standards prescribed by the standards, such as BIS, CES, CPHEEO, ICMR and WHO. The average value of the water quality index for Pazhayar river was 49.01 (during monsoon period) indicating that this river is under moderate pollution of water quality rating. Based on this report, appropriate steps to be taken to control the pollution in this river. © 2016 - Kalpana Corporation.

Abstract
Steganography is the art of concealing the secret text or image into another image. In case of images, the embedded message must be strong to common image processing problems such as compression, gaussian noise, impulse noise, speckles noise, resizing etc. The main problem associate with steganography is the embedding of message resembles channel noise. To avoid this problem multi layer image encryption and decryption using compressed sensing method for image recovery has been proposed. Our proposed method allows hiding the message in to the significant portion of the cover image. A semantic content of an image is one which groups the pixels together by common semantic meaning. Then extract the embedded message using advanced signal recovery techniques in compressive sensing. Image retrieval is the key method of compressive sensing technique. It reproduce the source image or the given input image or text. Our proposed results show that image steganography technique gives better performance than other encryptions. © International Science Press.

Abstract
To hide the locations of the hackers, spoofed source IP address is used. Development of IP traces back mechanisms are used to identify the true spot of the spoofers. Exact spoofers location was not identified till now, because no common IP Trace back mechanism was adopted. To overcome the difficulties of the earlier techniques, we implement Passive IP Traceback (PIT) mechanism.PIT detects path backscatter messages (ICMP messages) generated by intermediate devices in the network and traceback the spoofers using topology. We apply Pit on path backscatter data set to identify the locations of the spoofers. Also by employing the TTL field in IP packets, the geographical location details of routing device near to IP spoofers are found. ï¿½ International Science Press.

Random pattern security in automatic teller machine

(2016) *International Journal of Control Theory and Applications*, 9 (9), pp. 4061-4066.

[a] Department of Computer Science and Engineering, Vel Tech Multi Tech Engineering College, Avadi, Chennai, Tamilnadu, 62, India
[b] Department of Computer Science and Engineering, Bharath University, Chennai, Tamilnadu, India

Abstract
One of the most commonly occurring problems in the recent years are the ATM (Automatic teller machine) frauds. People lose their money due to lack of awareness. The major reason for such kind of actions is the attacks made on the 4-digit pin (Personal Identification Number) which is being used as a password for authentication in ATM. The attacks such as shoulder surfing and recording attacks are becoming more common in ATM. The PIN number is not given proper security to overcome such attacks. The proposed method uses the pin entry methods which are resistant to such attacks. In our proposed method instead of using a single pin, a new pin is generated for every usage of the ATM by the user. © International Science Press.

Dynamic signal transmission in wireless sensor network using sensible power management
(2016) *International Journal of Control Theory and Applications*, 9 (9), pp. 3805-3812.

[a] Department of Computer Science and Engineering Anna University, Chennai, Tamilnadu, India

Abstract
The wireless sensor network usage has been increased to a greater extent nowadays. The usage of wireless sensor network is extended to a vast number of applications, such as health monitoring, pipeline structure alignment monitoring, weather monitoring, transportation management, Agriculture, manufacturing process, etc..,. The nodes which form the wireless sensor network are called as wireless sensor nodes. These nodes use limited battery resources for working and also it cannot be backed up by large power resources. Physical monitoring and changing of the batteries are not convenient at all times since the placement of these sensor nodes are not always accessible and the environment is also not suitable for humans for most of the cases. In such scenarios the usage of the limited power is an important factor in wireless sensor networks. In this paper, we proposed an SPM (Sensible power Management) algorithm to preserve the power by controlling the receiving and transmission of the signals to and fro from the nodes. The main aim of the algorithm is to analyze the need for transmission and the power needed for transmission and detect the false node, thereby preventing unwanted transmission. Identifying the need for transmission is a heavy computational process and our aim is to increase the life time of the nodes and also to reduce the computation time needed. This automatically leads to an increase in the life time of the wireless sensor nodes. © International Science Press.

Systematic approach for utilization of IOT environment by the weak people

(2016) *International Journal of Control Theory and Applications*, 9 (9), pp. 4067-4069.

[a] Department of Computer Science and Engineering, Vel Tech Multi Tech Engineering College, Avadi, Chennai, Tamilnadu, 62, India
[b] Department of Computer Science and Engineering, Bharath University, Chennai, Tamilnadu, India

Abstract
Internet of Things is the network of physical objects such as buildings, devices and other items embedded with sensors, electronic, software and network connectivity that enables these objects to collect and exchange data. Even though it is easy to handle devices at the IOT environment, weak people like children, physically disabled and old people struggles a lot to handle the devices properly in IOT environment. This paper proposes a systematic methodology to protect and handle the IOT environment by the weak people using intelligent systems and user centric system to collect the data from IOT environment and measure it to visualize the data, hence provides a user friendly IOT environment. © International Science Press.

An innovative web based learning framework to assist a non-formal education system
(2016) *International Journal of Control Theory and Applications*, 9 (6), pp. 2861-2871.

[a] Vinayaka Missions University, Salem, India
[b] Bharath University, Seliaiyur, Chennai, India

Abstract
Nowadays, it is quite be difficult to offer the quality of education for learner in non-formal ways in India. Due to limited resource, budget problem and family burden, there are many people are not capable to adopt formal education systems. In literature, there is no proper work for non-formal based education system. However, current systems have low content classification accuracy as well poor performance in terms of content extraction from database. To overcome these issues, this paper presents an innovative web based learning framework to assist a non-formal education system. This system reduces the gap between education system and learner. It brings opportunities for learner to adapt standard education system with no age bar and time constraints. It will be easily accessible by utilization of centralized database. To evaluate the learner performance, this system also creates the user interface for teachers and board. To enhance the classification accuracy, information extraction and course content management, Effective Learning Content Monitoring Algorithm is presented. This approach also assists to user to re-ranked content indexed based on learner query. Based on experimental results, proposed approach perform good results in the terms of accuracy, information extraction and content management compare than existing approaches. © International Science Press.

Abstract
Electrospinning is a facile, yet low cost and reproducible technique that can use both natural and synthetic polymers to address problems in diagnosis and treatment of diabetes. For the diagnosis of diabetes, effective continuous glucose monitoring of the blood glucose level can be achieved by using electrospun glucose biosensors. Electrospun nanofibers confer a high-surface area, micro-porosity, and potential to encapsulate drugs or biomolecules within nanofibers. Even though electrospinning has been used widely there is no review available till now with the applications of electrospinning specifically for the diagnosis and treatment of diabetes. In this critical review, recent advances of electrospinning to optimize the glucose sensing ability and a myriad of diabetic drug delivery techniques via electrospinning are discussed. Future perspectives of biodegradable nanofibers are also discussed in the last section, which highlights the current challenges, innovation and development of novel electrospun nanofibers for theranostics targeted to diabetics. © 2016 The Royal Society of Chemistry.

Epileptic seizure detection using EEG signals by means of stationary wavelet transforms
(2016) *International Journal of Control Theory and Applications*, 9 (4), pp. 291-296. Cited 2 times.

Abstract
Wavelet transform provides a fine means of classifying seizure EEG signals from the normal EEG signals. Stationary wavelet transform (SWT) is used to further improve the performance of discrete wavelet transform. EEG signal prediction and classification can be bolstered up by applying SWT. In this work the residues obtained from denoising the signal using SWT is considered. Its arithmetical factors like standard deviation mean and median absolute deviation, maximum norm and histogram are considered and analyzed. It can be vividly seen that the seizure EEG signal parameters are higher than the normal EEG wave pattern. The original wavelet used here is a novel wavelet named as eegwav which has a resemblance with the EEG wave pattern. © International Science Press.

Abstract
Background: Activation and inactivation of nuclear factor of kappa light chain gene enhancer in B cells (NFKB) is tightly regulated to ensure effective onset and cessation of defensive inflammatory signaling. However, mutations within NFKB, or change in activation and inactivation molecules have been reported in a few cancers. Although oral squamous cell carcinoma is one of the most prevalent forms of cancer in India, with a development associated with malignant transformation of precancerous lesions, the genetic status of NFKB and relative rates of change in oral precancerous lesions remain unknown. Hence in the present study we investigated all twenty four exons of NFKB gene in two precancerous lesions, namely oral submucous fibrosis (OSMF) and oral leukoplakia (OL) to understand its occurrence, incidence and assess its possible contribution to malignant transformation. Materials and Methods: Chromosomal DNA isolated from twenty five each of OSMF and OL tissue biopsy samples were subjected to PCR amplification with intronic primers flanking twenty four exons of the NFKB gene. The PCR amplicons were subsequently subjected to direct sequencing to elucidate the mutation status. Results: Sequence analysis identified a novel heterozygous mutation, c.419T>A causing substitution of leucine with glutamine at codon 140 (L140Q) in an OL sample. Conclusions: The identification of a substitution mutation L140Q within the DNA binding domain of NFKB in OL suggests that NFKB mutation may be relatively an early event during transformation. To the best of our knowledge, this study is the first to have identified a missense mutation in NFKB in OL.

Abstract
Background: In the recent internet world, the watermarking security dispute has incurring design challenges on watermarking techniques. This article has anticipated a robust and secure watermarking pattern, based on SC-LWT-SVD which is projected so as to challenge the numerous serious watermarking security disputes, i.e., copyright protection through encryption, unsanctioned interpretation, false positive recognition, and numerous prerogatives of tenure complications. Methods: Initially SC-LWT is accomplished to split the input values, in order to acquire approximate coefficients. The SVD is applied on LWT coefficients to originate singular constants. Findings: The proposed SC-LWT- SVD constructed watermarking arrangement is verified with numerous malicious and un-malicious outbreaks and the experimental outcomes illustrate that it comprehends the security prerequisites which resolves false positive detection and copyright protection. Furthermore, this pattern is deliberated to blind scheme. Application: The simulation model is accustomed to verify the viability of the anticipated pattern and its forcefulness in contradiction of numerous outbreaks and to link with some earlier systems.

A smart automated embedded based PCB-bare board testing machine design and development using flexible flying probe

(2016) *Indian Journal of Science and Technology*, 9 (25), art. no. 96604, . Cited 1 time.

DOI: 10.17485/ijst/2016/v9i25/96604

Abstract
Background/Objectives: To design an automated embedded based flexible flying probe for testing PCB bare board more accurately which is one of the toughest challenge in manual testing. Methods/Statistical Analysis: Embedded based flexible flying probe can precisely position a probe on test points with high accurateness achieved by means of microstepping motors and linear laser encoders. The probe is moved horizontally and vertically based on the command passed by stepper motor which in-turn get the information from the prototype in format of Gerber file. First the flying probe checks the connectivity between two points then if the connectivity is good it will check the next track. Findings: This novel invention of flying probes are developed from new-fangled and novel thought intended to produce fasten testing speed, improved access, and enhanced error coverage. During the testing process if the machine determines some problem in the connectivity, it read the problem and send the error report on the PC display. From the error report, we can identify the fault placed in the PCB. A log file with test results is generated & stored on the PC. Fault details are sent to display unit of PC. The PC displays the matching accuracy and fault detection. The experimental result was conducted on 3 different PCB Bare board and the testing result shows the 92% accuracy and 18% false detection rate. It is compared with the jig board tester which produces less result compared to the proposed technique. The chief confront of this proposal is low down equipment and dispensation cost, absolute testing accurateness and capability to position close to faults and faults that may source irregular breakdowns. Applications/Improvements: This machine can be used for testing any type of PCB board. This proposed work develops a smart flying probe to test PCB which will significantly decrease test times therefore increasing productivity.

Abstract
This paper represents the comparison of carrier-based bipolar pulse width modulation technique such as phase disposition, phase opposition disposition, alternating phase opposition disposition, carrier overlapping and variable frequency for the choice of three phase nine level cascade multilevel inverters. In this paper, cascade multilevel inverter topology with a multiconversion cell consists of two unequal voltage sources and it produces nine level output voltages at load terminal. Simulation results are performed by using MATLAB/Simulink. It indicates that alternating phase opposition disposition pulse width modulation provides higher output voltage with less harmonic distortion for all pulse width modulation techniques. It is also observed that the carrier overlapping pulse width modulation technique provides higher fundamental RMS output voltage for all pulse width modulation techniques. Abstract
Objectives: In the present study digitally recorded Intra Oral Periapical radiographs (IOPA) are investigated. Methods/Analysis: This paper presents an innovative algorithm for automatic segmentation of the digital IOPA radiograph in one or more qualified regions of interest. Segmentation of IOPA is done repetitively till all teeth in the image are extracted. These segmented images resulting from this algorithm will now have one tooth in one image. Findings: A radiograph with exactly one tooth in image is extremely useful for further study and analysis of individual tooth in many and diverse applications of computer assistance in processing of dental radiographs. The segmentation algorithm proposed in this paper, necessarily being a spatial segmentation method, separates regions of interest without any loss or alterations in the data. The algorithm works successfully on 76 digital IOPA radiographs out of 80 images in test data. Novelty/Improvements: The algorithm proposed in the paper is fully automatic and does not require any human intervention. The segmentation algorithm proposed separates one tooth with its perimeter region intact in one image. The number of output images generated are equal to number of teeth in input IOPA.

Automatic segmentation of lower jaw and mandibular bone in digital dental panoramic radiographs
(2016) *Indian Journal of Science and Technology*, 9 (21), art. no. 90293, . Cited 8 times.

DOI: 10.17485/ijst/2016/v9i21/90293

Abstract
Objectives: Panoramic x-ray is a medical imaging technique used in dentistry. This paper aims to present fully automatic segmentation algorithm to extract lower jaw and mandible from panoramic x-ray. Methods/Analysis: Panoramic x-rays provide features of various diseases like advanced periodontal diseases, cysts, tumors, impacted teeth, fractures in lower or upper jaw, etc. Image processing techniques are applied on these images to detect diseases automatically. Segmentation is an inevitable step in automation to extract disease features. Majority existing literature use semi-automatic method for segmentation of panoramic x-ray. The algorithm proposed in this paper is fully automatic method of segmentation. Findings: Panoramic x-rays give entire view of mouth and facilitate assessment of hard tissue structures of the facial area rather than assessment of dental carries. Segmentation of panoramic x-rays is an inevitable step in automating diagnosis of oral disorders like, tumor, cysts, fracture, etc. In this paper, an algorithm is developed for automatic segmentation of lower jaw and then mandibular bone in dental digital panoramic x-ray. Dental digital panoramic x-ray is a good quality image which does not require noise removal. The segmentation algorithm uses novel strips method where input image is subdivided in number of strips. These strips are further processed to separate lower jaw and mandible from input image. The algorithm is fully automatic and does not involve human intervention at any level. Paper presents analysis of number of strips as 3, 5, 7 and 9. The algorithm presented in this paper gives 93% success for segmentation of lower jaw and 90% success in segmentation of mandible structure when strip count is 5. Applications/Improvement: Strip method focuses ROI and ignores components like teeth, spinal cord shadow, etc. Central strip is useful to segment lower jaw whereas side strips are useful to detect mandible edge points.

Abstract
Ayaskriti is an Ayurvedic preparation for the treatment of anemia, weight loss and skin related diseases. This is made of a number of plants and plant parts. The present study deals with antioxidant activities of Ayasriti, such as DDPH assay, FRAP assay and Hydrogen peroxide scavenging activity assay. It was found that all the three assays indicated that Ayaskriti has antioxidant activity. This is one step towards understanding the medicinal efficacy of this medicine.

Abstract
The present study deals with the antioxidant assays, namely, DDPH assay, FRAP assay and Hydrogen peroxide Scavenging Activity assay of one Ayurvedic formulation, Kulathadi Kashayam, which is a known medicine for gynecological disorders. The report suggests that all the three assays have clearly indicated that Kulathadi Kashayam has very good antioxidant potential which could be one of the reasons for its action as an effective medicine for gynecological disorders.

Author Keywords
DDPH; FRAP; Hydrogen Peroxide Scavenging Assay; Kulathadi Kashayam

Index Keywords
1,1 diphenyl 2 picrylhydrazyl, antioxidant, hydrogen peroxide, kulathadi kashayam, reactive oxygen metabolite, unclassified drug; antioxidant activity, Article, Ayurveda, bioassay, controlled study, drug efficacy, drug formulation, drug mechanism, fluorescence recovery after photobleaching, IC50, nonhuman, photochemistry

Chemicals/CAS
1,1 diphenyl 2 picrylhydrazyl, 1898-66-4; hydrogen peroxide, 7722-84-1

Abstract
Otomycosis or fungal infection of the External Auditory canal and infrequently affecting the middle ear is a common condition encountered worldwide in ENT practice. It is more prevalent in hot, humid and dusty environment of tropics and subtropics. More predominant in males with a high incidence in the age group of 21-30years and is mostly unilateral. The common presenting symptoms are itching discharge, fullness, hearing impairment, tinnitus and pain. The predisposing factors generally are frequent instrumentation and use of unsterile oil for cleaning spread of fungal infection from elsewhere in the body. Though diagnosis is mostly clinical, confirmation is by 10% KOH staining and SDA culture for fungus. Most common isolates are Aspergillus and candida sp. Management is by preventing factors predisposing to otitis externa by patient education, and treatment is by, frequent suctioning and use of 1% cotrimazole antifungal drops. Eradication of disease is difficult in presence of mastoid cavity. Complications are more in the immunocompromised. © 2010 RJPBCS.

Author Keywords
1% cotrimazole drops; 10% KOH staining; Aspergillus; Candida sp; Immunocompromised; Otitis externa; Otomycosis; Predisposing factors; SDA (Sabourands dextrose agar) culture

Index Keywords
amphotericin B, clotrimazole, tolnaftate; Aspergillus flavus, Aspergillus fumigatus, Aspergillus niger, bleeding, Candida albicans, Candida parapsilosis, Candida tropicalis, disease eradication, drug treatment failure, external auditory canal, fungus culture, health education, hearing impairment, human, immunocompromised patient, middle ear, myringoplasty, necrosis, nonhuman, otalgia, otomycosis, pain severity, patient education, Review, Scedosporium apiospermum, tinnitus, Trichosporon asahii, ulcer

Chemicals/CAS
amphotericin B, 1397-89-3, 30652-87-0; clotrimazole, 23593-75-1; tolnaftate, 2398-96-1

Abstract
The advent of nanotechnology has revolutionized various scientific inventions, out of which the debut of nanomedicine is outstanding. Especially, research has embarked on nano-drug delivery for treating cancer. Natural compounds present in plants, namely phytochemicals, have been extensively exploited for their anticancer properties. Despite their excellent anticancer abilities, phytochemicals are limited by their low water solubility and poor bioavailability. However, the field of nanotechnology has overcome these limitations. This review focusses on various methods of nano-drug delivery of phytochemicals against the killer disease, cancer. Common carriers that were employed ranged from micelles, with a polymeric base, to dendrimers, liposomes and nanoparticles. The phytochemicals were found to become more soluble when delivered by the nanocarriers and exhibited a remarkable effect on the cancer cells, compared to their free form. More interestingly, the half-maximal dose of the phytochemical was reduced significantly when it was delivered by the nanocarrier. On the whole, this review encourages the idea of "cancer-nanotechnology" after in-depth clinical studies on these phytochemical-loaded nanocarriers. Moreover, it will epitomize the nanocarriers as a crusader in improving cancer chemotherapy by reducing undesired effects and will invigorate site-specific drug delivery. © The Royal Society of Chemistry.

Abstract
Cd(1-x)Co(x)S/rGO nanocomposites were synthesized by an easy and simple one–pot co-precipitation method. The composites were characterized by using X-ray diffractometer (XRD), Fourier transform infrared (FTIR), Raman spectroscopy, Thermogravimetric Analysis (TGA). The presence of elements was confirmed by X-ray photoelectron spectroscopy. The morphological studies FE-SEM and TEM shows that the Cd(1-x)Co(x)S nanoparticles were deposited on the surface of reduced graphene oxide sheets. The electrochemical property was studied by CV analysis, which indicates the introduction of Co ions into CdS nanoparticles on to the rGO sheets results the increase in the integral area and current. This material could be useful for energy storage devices. © 2016, Sphinx Knowledge House. All rights reserved.

Abstract
The present study deals with the antioxidant assay and GC MS analysis of one Ayurvedic medicine Talisapatradi Churnam. This medicine is used to treat respiratory and digestive disorders. The medicine was subjected to DPPH, FRAP and Hydrogen Peroxide scavenging assays and it was found that it has good antioxidant potential. The GC MS analysis results indicated the presence of twenty six bio molecules of which some of them like n-Hexadecanoic acid, Octadecanoic acid, piperine, Phenol, 2, 4-bis (1, 1- dimethylethyl), Glycerol 1-palmitate, 7, 9-Di-tert-butyl-1-oxaspiro(4,5)deca-6,9-diene-2,8-dione, Eicosane, 2-methyl- derivative, Octadecanoic acid esters, 2-(3,4-Methylenedioxyphenyl) cyclohexanone and 5-Isopropyl-2,8-dimethyl-9- oxatricyclo[4.4.0.0(2,8)]decan-7-one were present in higher quantities whereas some minor compounds like Heptadecane, 1,3- Benzodioxole, 5,5'-(tetrahydro-1H,3H-furo[3,4-c]furan-1,4-diyl)bis-, [1S-(1α,3aα,4β,6aα)]-, Octadecane, 3-ethyl-5-(2-ethylbutyl)-, Heneicosane, Heptadecane, 2,6,10,15-tetramethyl-, Isopropyl myristate, Hexadecane, 2,6,11,15-tetramethyl-, Diethyl Phthalate, β- Asarone and Geranyl-α-terpinene were also found. The study tries to correlate the medicinal activity of the medicine with the antioxidant activity and with some important bio molecules known for their similar medicinal roles. © 2016, Global Research Online. Anatomy of caecum in cadavers

(2016) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 7 (1), pp. 156-158.

[a] Department of Anatomy, Sree Balaji Medical college, and Hospital, Bharath University, Chrompet, Chennai, Tamil Nadu, India
[b] Indira Gandhi Medical college and hospital, Pondicheery, India
[c] Madras Medical College, Chennai, India

Abstract
Aim of this study to detail discussing the anatomy of caecum in adult cadavers. Anatomical and topographical variations of the caecum are known to occur. Anatomical variations in caecum also have been observed. The study was carried out on 50 adult cadavers over a period of 2 years. The anatomy of caecum was studied in detail. 50 embalmed cadavers (30 male and 20 female) were dissected to study position, shape, length and width of caecum. The study was done in the department of anatomy of madras medical college, Chennai. Out of 50 adult cadavers in 48 cases the caecum was found in right iliac fossa, but only in two cases it was situated in the sub-hepatic region. Out of 50 adult cadavers in 46 cases shape of caecum were normal adult type(Ampullary), 2 cases were of exaggerated variety, one case was of infantile type, and one case was of fetal type. The length of caecum in 30 adult males was 6.0 cm± 0.96 SD[range: 4.0-9.0 cm] and width was 6.1cm ± 1.0 SD[range:3.5-12.0 cm]. The length of caecum in 20 adult females was 5.9 cm± 0.37 SD [range: 5.5-6.5 cm] and width was 6.6cm ± 0.38 SD [range:5.5-6.7 cm]. The knowledge of anatomy of caecum is of significant importance during surgical and radiological procedure.

Abstract
The QoS-aware cloud service composition is a significantly crucial concern in dynamic cloud environment. There is multi-nature services are clustered together and integrated with multiple domains over the internet. Because of increasing number private and public cloud sources and predominantly all cloud services offers similar services. However this differs in their functionalities depend on the QoS constraints. This drags more complexity in choosing a clustered cloud services with optimal QoS concert, an enhanced Genetic Particle Swarm Optimization (GPSO) Algorithm is anticipated to crack this crisis. With the intention to construct the QoS-aware cloud composition algorithm, all the parameters to be redefined such as price, position, response time and reputation. The Adaptive Non-Uniform Mutation (ANUM) approach is proposed to attain the best particle globally to boost the population assortment on the motivation of conquering the prematurity level of GPSO algorithm. This strategy also matched with other similar techniques to acquire the convergence intensity. The efficiency of the anticipated algorithm for QoS-aware cloud service composition is exemplified and evaluated with a Modified Genetic Algorithm (MGA), GN_S_Net, and PSOA the outcomes of investigational assessment signifies that our model extensively achieves than the existing approaches by means of execution time with improved QoS performance parameters. © Springer International Publishing Switzerland 2016.

How do repeat suicide attempters differ from first timers? An exploratory record based analysis

(2016) *Journal of Neurosciences in Rural Practice*, 7 (1), pp. 91-96. Cited 5 times.

DOI: 10.4103/0976-3147.168435

[a] Department of Psychiatry, Jawaharlal Institute of P.G. Medical Education and Research, Puducherry, Tamilnadu, 605 006, India
[b] Department of Psychiatry, Sree Balaji Medical College and Hospitals, Chennai, Tamil Nadu, India

Abstract
Background: Evidence indicates that repeat suicide attempters, as a group, may differ from 1st time attempters. The identification of repeat attempters is a powerful but underutilized clinical variable. Aims: In this research, we aimed to compare individuals with lifetime histories of multiple attempts with 1st time attempters to identify factors predictive of repeat attempts. Setting and Design: This was a retrospective record based study carried out at a teaching cum Tertiary Care Hospital in South India. Methods: Relevant data was extracted from the clinical records of 1st time attempters (n = 362) and repeat attempters (n = 61) presenting to a single Tertiary Care Center over a 4 half year period. They were compared on various sociodemographic and clinical parameters. The clinical measures included Presumptive Stressful Life Events Scale, Beck Hopelessness Scale, Coping Strategies Inventory - Short Form, and the Global Assessment of Functioning Scale. Statistical Analysis Used: First time attempters and repeaters were compared using appropriate inferential statistics. Logistic regression was used to identify independent predictors of repeat attempts. Results: The two groups did not significantly differ on sociodemographic characteristics. Repeat attempters were more likely to have given prior hints about their act ($\chi 2$ = 4.500, P = 0.034). In the final regression model, beck hopelessness score emerged as a significant predictor of repeat suicide attempts (odds ratio = 1.064, P = 0.020). Conclusion: Among suicide attempters presenting to the hospital, the presence of hopelessness is a predictor of repeat suicide attempts, independent of clinical depression. This highlights the importance of considering hopelessness in the assessment of suicidality with a view to minimize the risk of future attempts.

Abstract

Spinel nickel aluminate (NiAl 2O4) nanospheres (NSPs) and nanoplatelets (NPLs) were successfully synthesized using a facile microwave combustion method (MCM) and conventional combustion method (CCM), respectively, using urea as the fuel. The as-prepared samples were characterized by powder X-ray diffraction (XRD), Fourier transform infrared (FT-IR), high-resolution scanning electron microscopy (HR-SEM), high-resolution transmission electron microscopy (HR-TEM), energy-dispersive X-ray spectroscopy (EDX), selected area electron diffraction (SAED), UV–Visible diffuse reflectance spectroscopy (DRS), photoluminescence (PL) spectroscopy, and vibrating sample magnetometer (VSM) analysis. Powder XRD, FT-IR, EDX, and SAED results showed that the samples were pure phase spinel NiAl 2O4 nanocrystals without any other secondary phase impurity. UV–Vis DRS and PL spectroscopy results were used to calculate the energy band gap (Eg) value of the samples which is 3.41 and 3.08 eV for NiAl 2O4 NSPs and NiAl 2O4 NPLs, respectively. VSM results of the NiAl 2O4 NPLs sample show lower Ms (49.16 × 10 −3 emu/g) values compared with the NiAl 2O4 NSPs sample (73.42 × 10 −3 emu/g), which confirm that both the products have ferromagnetic behavior. NiAl 2O4 NSPs were found to have higher surface area than NiAl 2O4 NPLs, which in turn leads to the improved performance towards the selective oxidation of benzyl alcohol into benzaldehyde, with 100 % selectivity, and it was found that the NiAl 2O4 NSPs sample show higher conversion (96.25 %) than NiAl 2O4 NPLs (85.37 %). The as-prepared samples show high activity, good reusability, remarkable stability, and environmentally friendly materials for industrial and technological applications. Abstract

Mesoporous metal oxides ZnO are prepared by wet impregnation via hard templating synthesis method using KIT-6 mesoporous silica. The pore size of mesoporous silica with the symmetry of bicontinuous cubic Ia3d have been controlled in the range of 3.4-4.9 nm, indicating the existence of ordered within the silica walls respectively, by choosing surfactants and adjusting the temperature. The pore size of the silica template has been considered to be an important factor that determines the mesostructure of the resulting metal oxides. The prepared ZnO/KIT-6 samples have been studied by XRD, transmission electron microscope (TEM), BET surface area, and photoluminescence (PL) spectroscopy. The ZnO/KIT-6 nanocomposite has the ordered mesostructure of KIT-6 can be used as a white light emitting diode (w-LED) and ultraviolet nanolasers. © 2015 Elsevier B.V. All rights reserved.

Development and Validation of a Scale to Assess Barriers to Health Care Seeking Among Medical Students
(2015) *Medical Science Educator*, 25 (4), pp. 377-382. Cited 2 times.

DOI: 10.1007/s40670-015-0158-y

Abstract
Background: Evidence suggests that medical students often hesitate to seek formalized care for their health issues and concerns during training. Presently, there is no validated instrument to assess barriers to health care seeking among medical students. Hence, we attempted to develop and validate an English language questionnaire for assessment of self-reported barriers to physical and mental health care seeking among medical students. Methods: The questionnaire was developed at a medical college in India and was evaluated among the entire undergraduate medical student population of the college. Exploratory factor analysis was conducted to find the factor structure of the questionnaire. Results: The 28-item final instrument comprised of 14 Likert-type items each pertaining to physical and mental health care separately. Higher scores on the scale reflect greater barriers to treatment. The test-retest reliability was found to be good. The factor analysis yielded an optimum five-factor solution explaining 44.8 % of the variance in the score on the scale. The five factors broadly encompassed the dimensions of “stigma and confidentiality,” “awareness of procedures,” “felt needs,” “avoidance of formalized care,” and “preference for alternative treatment.” Conclusion: The present valid and reliable instrument is likely to have institutional utility in assessing barriers to health care service utilization among medical students and thus planning corrective strategies. © 2015, International Association of Medical Science Educators.

Abstract
In the present study, manganese (Mn)-doped zinc oxide (ZnO) nanoparticles were prepared by chemical precipitation method using the ionic liquid, 1-butylimidazolium glycolate as solvent and stabilizer. The structural phase and morphology were investigated by X-ray diffraction (XRD), Fourier transform infra-red (FT-IR), high resolution scanning electron microscopy (HR-SEM) with energy dispersive X-ray (EDX) analysis and high resolution transmission electron microscopy (HR-TEM). The crystallite size was calculated using Scherrer formula, and it was found to be 17.24 nm in size. The elemental analysis was investigated by energy dispersive X-ray analysis (EDX). Also, absorbance and emission spectra were measured by using diffuse reflectance (DRS) and photoluminescence (PL) studies. The band gap (Eg) was measured using Kubelka-Munk model and it found to be 3.15 eV. Vibrating sample magnetometer (VSM) showed the magnetic hysteresis (M-H) loop and confirmed the superparamagnetic nature of the sample. Mn-doped ZnO nanocatalyst was tested for the photo-catalytic degradation (PCD) of methylene blue (MB) and observed 94.53% efficiency. Copyright © 2015 American Scientific Publishers.

Abstract
Human Computer Interaction (HCI) technology characterizes an extremely developing area of research with application expert systems. HCI is used in many areas such as industrial design, personal information and interaction management. This paper describes how HCI design can be used in various technologies in order to achieve a certain performance. In this study, the concept of mutual understanding between the user, the machine and the existing approaches using lip movement, gesture recognition, gaze detection and voice recognition have been investigated. This paper also reviews how different types of electrophysiological signal based HCI (electroencephalography (EEG), electromyography (EMG) and electrooculography (EOG)) are designed for the same application. © 2015, International Journal of Pharmacy and Technology. Abstract
Energy is one of the basic requirements for the existence and development of human life. The focus is now shifting to energy conservation due to the problems associated with conventional energy sources. This project introduces a novel water heater product that can achieve the multi-functions with improved energy performance. This paper deals with experimental investigations on the performance of a water heater, which uses waste heat from a 1.5 tonne air conditioner. Thus incorporation of a water heater in the outdoor unit of a split-type air-conditioner would result in simultaneous room space cooling and water heating. The experimental results showed that the water heater is capable of producing 88 litres of hot water in one hour of time with a temperature of 52°C. It is seen that up to 37°C of hot water temperature, COP of the waste heat recovery system is more than the COP of conventional air conditioner. But after 37°C, with the increase in hot water temperature, the COP of the waste heat recovery system decreases and becomes less than the COP of conventional air conditioner.

Abstract
The Traveling Salesman Problem (TSP) is arguably the most prominent problem in combinatorial optimization. The simple way in which the problem is defined in combination with its notorious difficulty has stimulated many efforts to find an efficient solution procedure. The TSP is a classic tour problem in which a hypothetical salesman must find the most efficient sequence of destinations in his territory, stopping only once at each, and ending up at the initial starting location. Due to the combinatorial complexity of the TSP, approximate or heuristic solution procedures are almost always employed in practice. Few prospective applications of TSP includes ruling an optimized scan chains route in integrated chip testing, parcels collection and sending in logistics companies, and transportation routing problem. There have been many algorithms introduced to grant time competent solutions for the problem, both exact and approximate. This paper is a review of the recent research work done on various algorithm like genetic algorithm, tabu search algorithm, ant colony algorithm available with respective attributes to find the nearest optimal solution for the traveling salesman problem. It also relates the traveling salesman problem with the available algorithms and provides the advantages in providing a solution for TSP.

Author Keywords
Ant colony algorithm; Combinatorial optimization; Meta heuristics; Minimum cost GA; Tabu search

Nerve injuries during root canal treatment: A review
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 155-160.

DOI: 10.13005/bpj/668

[a] Department of Conservative Dentistry and Endodontics, Tagore Dental College and Hospital, Chennai, 600127, India
[b] Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath University, Chennai, 600100, India

Abstract
Nerve injury during root canal treatment is not a frequent complication, but when it occurs it needs immediate attention and prompt treatment. The symptoms of nerve injury may range from paraesthesia to hyperaesthesia or even dysaesthesia. Inferior alveolar nerve and its branches are commonly affected. Aetiology is over instrumentation, irritant irrigants and canal medicaments, loss of apical constriction and extruded sealants and obturation materials. Depending on the symptoms and the time of reporting, treatment options may vary. Continuous observation, surgical/ non-surgical retreatment, systemic prednisone, decompression surgery, intentional replantation of the tooth are the various treatment options available. Prevention of such injuries is by attention to detail. Adherence to canal working length throughout the instrumentation procedure and taking a radiograph during the initial phases of the obturation can help to prevent such nerve injuries.

Abstract
The incidence of emerging infectious diseases in humans has increased within the recent past or threatens to increase in the near future. Over 30 new infectious agents have been detected worldwide in the last three decades; 60 per cent of these are of zoonotic origin. Developing countries such as India suffer disproportionately from the burden of infectious diseases given the confluence of existing environmental, socio-economic, and demographic factors. In the recent past, India has seen outbreaks of eight organisms of emerging and re-emerging diseases in various parts of the country, six of these are of zoonotic origin. Prevention and control of emerging infectious diseases will increasingly require the application of sophisticated epidemiologic and molecular biologic technologies, changes in human behaviour, a national policy on early detection of and rapid response to emerging infections and a plan of action. WHO has made several recommendations for national response mechanisms. Many of these are in various stages of implementation in India.

Abstract
Angina bullosa hemorrhagica(ABH) is the term used todescribe benign subepithelial oral mucosal blisters filledwith blood that are not attributable to a systemicdisorder or haemostatic defect. The lesions are characterizedby their sudden onset. The pathogenesis isunknown, although it may be a multifactorialphenomenon. The soft palate is most commonly affected, but ABH may also appear on the buccal mucosa, lips and tongue. They appear as apainless, dark red and blood-filled blisterin the mouth that rapidly expand and rupturespontaneously in 24-48 hours. We present the case of a 30 year old male with Angina bullosa haemorrhagica.The clinical features of this case are discussed.

Leiomyoma of the gingiva

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 15-19.

DOI: 10.13005/bpj/645

[a] Department of Pedodontics and Preventive Dentistry, Tagore Dental College and Hospital, Chennai, India
[b] Department of Oral Pathology and Microbiology, SreeBalaji Dental College and Hospital, Bharath University, Chennai, Indi, India

Abstract
Leiomyomas are benign tumors of smooth muscle origin which occur more commonly in the uterus and the gastrointestinaltract. Oral leiomyomas have been reported in the literatures which are commonly present in the lip, tongue, buccal mucosa, palate and mandible. Most of the reported cases are in the 4th and 5th decades of life with very few cases reported in pediatric age group. Most of the lesions are small, asymptomatic and present as a smooth elevated area with pigmentation. Intraosseousleiomyoma's have also been reported in the mandible where it mimics a cyst. We present an 8 year old Indian (Asian) boy who presented with a large exophytic mass with a granulomatous surface on the lingual aspect of the mandible. The size, the site and the age of presentation makes this a rare case worth to be recorded.

Abstract
The field of oral Medicine is a speciality which is unique in reflecting Oral systemic relation. The most interesting aspect is that it serves a window to the human body. The role of oral medicine in diagnosing and treating human pathologies have a diverse role both pertaining to the maxillofacial area per se and also the overall health of the human body.

Author Keywords
Oral diseases; Oral medicine; Systemic relation

Index Keywords
cod liver oil, dendrimer, glucose, glycerol, lidocaine, phenol, plant medicinal product, quantum dot, rapamycin; cancer genetics, dentistry, depression, drug therapy, epigenetics, forensic identification, human, Human immunodeficiency virus infection, imaging and display, nanotechnology, personalized medicine, prolotherapy, Review, saliva analysis, senescence, stem cell research, stomatology, temporomandibular joint disorder, theranostic nanomedicine, tooth

Chemicals/CAS
cod liver oil, 8001-69-2; glucose, 50-99-7, 84778-64-3; glycerol, 56-81-5; lidocaine, 137-58-6, 24847-67-4, 56934-02-2, 73-78-9; phenol, 108-95-2, 3229-70-7; rapamycin, 53123-88-9

Is resistin a biomarker for periodontitis -An insight
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 145-147.

DOI: 10.13005/bpj/666

[a] Department of Periodontics, Tagore Dental College and Hospital, India
[b] Department of Oral Pathology and Microbiology, Sree Balaji Dental College and Hospital, Bharath University, Chennai, India

Abstract
Resistin is a recently discovered adipocytokine, having a potent biomarker quality. Initially resistin was thought to be produced by adipocytes alone; however, emerging evidence suggests that it is also produced in abundance by various cells of the immunoinflammatory system, indicating its role in various chronic inflammatory diseases. Data suggests that resistin plays a role in obesity, insulin resistance, cardiovascular diseases, and periodontitis. Resistin derived its name from the original observation that it induced insulin resistance (resist-in: resist insulin) in mice and is downregulated in mature murine adipocytes cultured in the presence of insulin sensitizing drugs like thiazolidinediones. It is well recognized that obesity, is associated with insulin resistance and diabetes. Research shows incremental elevation of resistin with periodontal disease activity and a reduced level of resistin, after periodontal therapy. Thus resistin would be one of the molecular links connecting obesity, periodontitis, and diabetes and may serve as a marker that links periodontal disease with other systemic diseases.

Abstract
Guided bone regeneration (GBR) is a reconstructive procedure of alveolar ridge using membranes. Combining platelet-rich plasma (PRP) with bone graft materials has been advocated as a means of enhancing rate and quality of new bone formation in regenerative procedures. This procedure is indicated when there is no sufficient bone for implantation, or in the case of optimal implant installation for esthetic or functional needs. The aim of this case report was to evaluate the potential of PRP in combination with Demineralized bone matrix(DMBM) along with membrane to enhance bone regeneration in an siebert's class III alveolar ridge defect .

Abstract
Periodontal diseases are polymicrobial diseases resulting in inflammation of the supporting structures of the teeth. The removal of the plaque biofilm by mechanical therapy not always results in total resolution of the lesion. Frequently adjuvant administration of antibiotics is required for better results. This article overview the factors to be considered while administering systemic antibiotics as an adjunct to mechanical debridement.

Abstract
Cell culture is in a limelight for past two decades because of its demand by pharmaceutical companies and cell biologist. Applicability of cell culture can vary from normal cell function to cancer treatment. It is a firm belief that cell culture will be the future trend form drug development to organ development. Hence it is inevitable for us to have knowledge on cell culture. Present article throws a light on basic idea on cell culture.

Abstract
Delayed tooth eruption is the most common complaint of a patient which can lead to the diagnosis of two main odontogenicanomalies, dentigerous cyst and odontome. This article presents a case report of a 13 year old male child with a complex odontome and a dentigerous cyst resulting in delayed eruption of both the first and second mandibular molars.

Abstract
The concept of nanotechnology has been made a lot of revolution in the field of dentistry both in diagnostic and therapeutic aspects. Dendrimers are a type of nanoparticles that has given promising results in various dental applications. This article gives a comprehensive view about the structure, synthesis, properties and applications of dendrimers.

Author Keywords
Dendrimers; Diagnosis; Therapeutics

Index Keywords
dendrimer, polyamidoamine; chemical structure, drug delivery system, encapsulation, gene therapy, human, nanotechnology, neutron capture therapy, photodynamic therapy, Review, static electricity, synthesis

Recent advances in root end filling materials : A review
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 219-224. Cited 3 times.

DOI: 10.13005/bpj/678

[a] Department of Conservative Dentistry and Endodontics, Tagore Dental College and Hospital, Chennai, 600127, India
[b] Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath University, Chennai, 600100, India

Abstract
The aim of the root end filling is to prevent the leakage of irritants from the root canal into the periapical region and to enhance the apical seal provided by the non surgical endodontic treatment. Various restorative materials which have been used for coronal restorations have been tried and tested as a root end filling materials, along with development of restorative materials exclusively for use as a root end filing material.In old times amalgam was considered the material of choice for root end filling. In recent times MTA has been developed which fulfils almost all the requirements of an ideal root end filling material and has become the gold standard against which the newer materials are compared.This article reviews the conventional root end materials in endodontics and gives a bird's eye view of the recent advances in root end filling materials.

Author Keywords

Bone substitues in prosthodontic service

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 245-247.

DOI: 10.13005/bpj/684

[a] Department of Prosthodontics, Tagore Dental College and Hospitals, Chennai, India
[b] Department of Prosthodontics, Sree Balaji Dental College and Hospital, Bharath University, Chennai, 600100, India

Abstract
The use of artificial bone graft substitutes has increased as the surgical applications widen and the availability of allograft bone decreases. The ideal graft substitute should reabsorb with time to allow and encourage new bone formation whilst maintaining its properties as an osteoconductive scaffold until it is no longer required. A potential disadvantage of some synthetic substitutes is their long dissolution time. Autologous bone grafting is currently considered as the gold standard to restore bone defects. However,clinical benefit is not guaranteed and there is an associated 8-39% complication rate. This has resulted inthe development of alternative (synthetic) bone substitutes.

Cyclin B in oral squamous cell carcinoma: Mini review
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 69-75.

DOI: 10.13005/bpj/653

[a] Department of Oral and Maxillofacial Pathology, Tagore Dental College and Hospital, Chennai, Tamilnadu, India
[b] Department of Oral Pathology and Microbiology, Sree Balaji Dental College and Hospital, Bharath University, Chennai, India

Abstract
Oral squamous cell carcinoma accounts for more than 50% of all tumours in India due to the increased use of tobacco and its products. The most common cause of mortality in OSCC is due to the local recurrence and regional and distant nodal metastasis, thus necessitating the need for proper therapy. Cyclins are a family of proteins that a play an important role in the cell cycle and its regulation. Cyclin B which belongs to the group of M cyclins is responsible for the G2/M transition and also the mitotic process. Cyclin B1 has been implicated in many cancers including Oral squamous cell carcinoma. Cyclin B2 which is coexpressed along with cyclin B1 is relatively less known. Cyclin B2 can act in the absence of cyclin B1 and vice versa too. Cyclin B1 can induce golgi fermentation faster than cyclin B2. Cyclin B2 can cause the progression of cell to undergo mitosis in the absence of cyclin B1. So in cancers both the cyclins play an important role. Targeted therapies have earlier targeted only the cyclin dependent kinases in the cyclin B1-Cdk complex. But now research is on to directly act against cyclin B. This mini review brings to light the role and expression of cyclin B in oral squamous cell carcinoma.

Abstract
Aerosols arising out of oral surgical procedures are composed of saliva, nasopharyngeal secretion, organic particle and blood. This aerosol may act as a vehicle for various bacteria and thus can become a source of infection. An evaluation of airborne bacterial contamination has been done to assess the bacterial composition of aerosols that are formed during surgical procedures. Thirty patients, of both gender in the age group of 18 to 25 years with mandibular impacted third molar who visited the Department of Oral and maxillofacial Surgery, in our center were selected for the study. Microbiological analysis of air borne contamination Petri dishes containing blood agar. Wilcoxon signed rank test, Friedman test using software SPSS version 17.0 Alpha hemolytic streptococci are the predominant bacterium seen in all the 30 surgeries followed by other bacteria. Bacteria grown on the blood agar plate near the surgeon and the patient are the same however Enterococcus faecalis and Escherichia coli are not grown in the agar plate kept near the instrument trolley. The dental surgery clinic should have proper air conditioning system with air filters that can reduce circulating aerosols and it should be made mandatory to find out whether the patient is in active stage of any infection before oral surgical procedure.

Abstract
It is not easy for criminals to escape the long arm of the law. Usually a suspect leaves a clue in a crime scene. From a dentist perspective mostly it will be a bite marks. Bite mark is a pattern made by teeth on a substrate. By comparing the dental status and DNA analysis it is possible now to identify a criminal. Scientific approach always requires a proper observation, recording and analysing when inspecting a clue. When analysing a bite marks it is necessary to follow the same scientific approach.It becomes a need for a dentist to know the normal bite marks and its variation. Present article throws a light on these aspects and adds little bit on way of presenting it.

Role of local drug delivery agents in the treatment of periodontal diseases

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 195-200.

DOI: 10.13005/bpj/674

[a] Department of Periodontics, Tagore Dental College, Rathinamangalam, Chennai, India
[b] Department of Periodontics, Sree Balaji Dental College and Hospital, Bharath University, Chennai, 600100, India

Abstract
Removal of the plaque biofilm mechanically forms the mainstay in the management of periodontal diseases. Mechanical debridement has its inherent limitations and frequent use of antibiotics is essential for complete resolution of the lesion. Antibiotics, when used directly into the site have more advantages than when administered systemically. This review highlight the rationale and beneficial effects of locally delivered agents.

Periodontal vaccines: A sophisticated treatment design in the future?

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 359-363.

DOI: 10.13005/bpj/704

[a] Department of Periodontics, Tagore Dental College and Hospital, Chennai, India
[b] Department of Periodontics, Sree Balaji Dental College and Hospital, Bharath University, Pallikaranai, Chennai, 600100, India

Abstract
Periodontal vaccine is a boon in periodontics. The demanding primary role of any periodontal vaccine would be to eradicate the global periodontal disease burden with the ultimate purpose of lowering periodontal disease associated morbidity in humans. In late eighteenth century, Edward Jenner developed and established the principle of vaccination using the cross protection conferred by cowpox virus, which is non pathogenic in humans. Vaccination accomplished can be active immunization, passive immunization or DNA vaccination, made from the antigenic epitopes in periodontopathic bacteria. The objective of periodontal vaccine is to identify the antigens involved in the destructive process of periodontitis against which antibodies would be evoked to exert protection. It also aims to induce mucosal antibody response with little or moderate doses of vaccine. Ongoing research & collaborative efforts can result in development of functional periodontal vaccine for human use in future.

Author Keywords
Active immunization; DNA vaccination; Epitope; Passive immunization; Vaccines

Index Keywords
antibody, antigen, cysteine proteinase, DNA vaccine, epitope, fimbria protein, gingipain, lithium derivative, lithium diiodosalicylate, monoclonal antibody, periodontal vaccine, rabbit antiserum, synthetic peptide, unclassified drug, vaccine; active immunization, Aggregatibacter actinomycetemcomitans, antibody response, antigenicity, Article, bacterial strain, bactericidal activity, clinical research, DNA immunization, drug efficacy, fimbria, human, nonhuman, passive immunization, peptide synthesis, periodontal disease, periodontitis, Porphyromonas gingivalis, vaccination, whole cell

Chemicals/CAS
cysteine proteinase, 37353-41-6

Abstract
Mucormycosis is a life threatening fungal infection caused by fungi of the order Mucorales and is one of the fulminant and fatal opportunistic infections, characterized by very acute onset, with a high mortality rate. Rhinocerebralmucormycosis is the most common type and its extension to the orbit and brain is quite usual. It is commonly reported in immunocompromised patients such as poorly controlled diabetics, immunosuppression with corticosteroids, hematological malignancy, solid malignancy, iron overload and burns. Mucormycosis is on the rise with an increase in incidence of Diabetes mellitus and HIV infection leading to immunocompromised status of the patient. Here in, reporting two cases of rhinocerebralmucormycosis in two diabetic patients with palatal perforation in both cases and this is a rare and late occurrence. One was in a known systemic lupus erythematosus (SLE) patient, which is a very rare incidence. Both the patients were successfully treated with a combination of surgical debridement and systemic amphotericin B administration. By presenting these two case reports we would like to point out that mucormycosis should be included in the differential diagnosis of hard palate ulcers and cellulitis, especially in diabetic patients.

Author Keywords
Mucorales; Rhino orbital; Subtotal maxillectomy; Vascular thrombosis

Index Keywords
amphotericin B; adult, Article, bone destruction, case report, computer assisted tomography, debridement, diabetic patient, differential diagnosis, ethmoid sinus, female, follow up, hard palate, human, human tissue, maxilla resection, mucormycosis, nose septum, pain severity, palate disease, palate ulcer, panoramic radiography, rhino cerebral mucormycosis, rhino orbital mucormycosis, systemic lupus erythematosus, tooth socket

Chemicals/CAS
amphotericin B, 1397-89-3, 30652-87-0

Juvenile aggressive fibromatosis: Review of literature

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 175-179.

DOI: 10.13005/bpj/671

[a] Department of Oral Pathology, Tagore Dental College, Rathnimangalam, Chennai, India
[b] Department of Oral Pathology, Sree Balaji Dental College and Hospital, Bharath University, Chennai, 600100, India

Abstract
Extra abdominal desmoid tumours also called as Aggressive fibromatosis (AF) or Juvenile aggressive fibromatosis (JAF) are rare, benign, slow growing, locally destructive tumours of musculoaponeurotic tissue. They are a type of desmoid tumour with a propensity to occur in the head and neck region and can occur at a young age. Early identification and diagnosis is crucial in management of this condition because of its locally aggressive biological behaviour. This article attempts to better understand this rare pathology with a review on its aetiology, clinical course and treatment options.

Author Keywords
Aggressive; Juvenile; Musculoaponeurotic; Tissue fibromatosis

Guided bone regeneration -A review

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 365-368.

DOI: 10.13005/bpj/705

[a] Department of Periodontics and Implantalogy, Tagore Dental College and Hospital, Chennai, India

Abstract
This paper is a review on Guided Bone Regeneration. Guided Bone Regeneration has emerged as a predictable method to enhance the bone volume in deficient recipient sites prior to implant placement. It provides sufficient bone volume and adequate soft tissue thickness to enable implants to be placed at the most optimal position from a prosthetic point of view. The barrier membrane acts as a physical barrier, excluding competing and non-osteogenic cells from the overlying mucosa into the membrane-protected space.

Temporomandibular joint ankylosis -A case report
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 533-536.

DOI: 10.13005/bpj/741

[a] Department of Oral Medicine and Radiology, Tagore Dental College and Hospital, Vandalur post, Ratinamangalam, Tamilnadu, India
[b] Department of Oral and Maxillofacial Pathology, Sree Balaji Dental College and Hospital, Bharath University, Pallikaranai, Chennai, 600100, India

Abstract
Temporomandibular Joint (TMJ) ankylosis is a condition in which condylar movement is limited by a mechanical problem in the joint ("true ankylosis") or by a mechanical cause not related to joint components ("false ankylosis"). True ankylosis may be bony or fibrous. In bony ankylosis, the condyle or ramus is attached to the temporal or zygomatic bone by an osseous bridge. In fibrous ankylosis a soft tissue (fibrous) union of joint components occurs; the bone components appear normal. False ankylosis may result from conditions that inhibit condylar movement, such as muscle spasm, myositis ossificans, or coronoid process hyperplasia. Most unilateral cases are caused by mandibular trauma or infection. The most common cause of bilateral TMJ ankylosis is rheumatoid arthritis, although in rare cases bilateral fracture may be the cause. Here we report a case of TMJ ankylosis in a 30 year-old male patient showing most of the characteristic features of this condition.

Abstract
Chlorhexidine is a commonly used antiplaque and antigingivitis agent. Chlorhexidine was used as a broad spectrum antiseptic since the 1950's. Its antibacterial action is due to the disruption of the bacterial cell membrane by the chlorhexidine molecules, increasing the permeability and resulting in cell lysis. It can be either bacteriostatic or bactericidal depending on the dose. It is available in various formulations. This article discusses the clinical application of chlorhexidine in implant dentistry.

Author Keywords
Antibacterial; Chlorhexidine; Spectrum antiseptic

Index Keywords

Accuracy of three different electronic apex locators -A pilot study
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 335-339.

DOI: 10.13005/bpj/700

[a] Department of Conservative Dentistry and Endodontics, Tagore Dental College and Hospital, Chennai, India
[b] Department of Conservative Dentistry, Sree Balaji Dental College and Hospital, Bharath University, Pallikaranai, Chennai, 600100, India

Abstract
Accurate working length determination is a prerequisite for successful root canal treatment, reducing the chance of insufficient cleaning of the canal or of damaging the periapical tissues from over instrumentation. The use of an electronic apex locator has improved the accuracy of the working length measurement in clinical endodontics. The purpose of this in-vivo study was to compare the accuracy of three different Electronic Apex Locator (EALs). Twelve human mandibular premolar to be extracted for orthodontic treatment were selected. Teeth were divided into three groups Group 1 (n = 4) (IPex, NSK NAKANISHIINC, Tochigi, Japan) Group 2 (n =4) (Mini Apex Locator ,Sybron Endo, Glendora,CA, USA) Group 3 (n=4)(IROOT S,SDenti, Korea).After determining the working length the No 10 Kfile was cut at the reference point and sealed in position using Glass Ionomer cement. Tooth is extracted and apical 3-5mm is exposed and photographed using SLR digital camera. The distance between file tip and minor apical diameter were measured using a calibrated measurement software. (Adobe .version 9). Raw data of 12 samples were recorded and inference was made. Within the limitation of this pilot study we are able to comment that all the Electronic Apex Locators evaluated in this study performed to the recommended accuracy. Further study is important to statistically analyze above mentioned comment.

Abstract
Useful purpose for third molars has become more difficult, especially when one considers that people experience pain and disease when third molars are not extracted, and many other people experience pain and morbidity when they are extracted. Whether there is a need for these teeth in the dentition is a question worth asking? This study aims to present data about the prevalence and distribution of mandibular third molars students of Tagore Dental College & Hospital. The sample of 200 students was selected by Simple Random Sampling Method in the age group between 21 to 25 years. Intraoral periapical radiographs of right and left mandibular third molars were taken and clinical examination was done to assess the presence of pericoronitis, periodontal pocket, proximal caries, root resorption in distal surface of second. On clinical examination, 23% of pericoronitis was present, 12% of periodontal pockets, 8% proximal caries and no resorption were observed. Within the limitations of this study, it was concluded that significantrelatively less impact of mandibular third molar on second molars. Further studies are recommended with increased sample size.

Abstract
Wepresent a case of odontogenickeratocyst involving the right maxilla in 15 years old boy. The histochemicalof the lesion was analysed by haematoxylin & eosin stain and picrosirius red stain.Expansilenatureof the lesion was assessed by using picrosirius red to categorize the fibrous wall of the cyst. The purpose of this case report is to stressthe point that even though the diagnosis of classical odontogenickeratocystis straight forward with histochemical study alone, it is prudent to profile the biology of each patient using less expensive methods before deciding the appropriate adjunctive surgical procedure,for proper rehabilitation of that particular patient as well as to avoid its recurrence in future.

Orthokeratinized odontogenic cyst of the mandible: Case report with unusual histopathologic features with review
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 121-125.

DOI: 10.13005/bpj/662

[a] Department of Oral and Maxillofacial Pathology, Tagore Dental College and Hospital, Chennai, Tamilnadu, India
[b] Department of Oral Pathology and Microbiology, Sree Balaji Dental College and Hospital, Bharath University, Chennai, India

Abstract
Orthokeratinizedodontogeniccysts(OOC's) are relatively uncommon developmental cysts lined with orthokeratinized epithelium consisting of prominent granular layer and a basal layer of low cuboidal flattened cells that show no tendency for nuclear palisading. OOC's has been considered a distinct entity from odontogenickeratocyst since they exhibit a less aggressive behavior and a very low recurrence rate. This report describes a 27 year old female patient who presented with a cyst with unique histopathological features. The purpose of this article is to present a case of OOC in the posterior mandible and also emphasize on the need for differentiating it from keratocysticodontogenictumor(KCOT) with a comprehensive literature review.

Resin infiltration technique for arresting white spot lesion: Case report
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 225-228.

DOI: 10.13005/bpj/679

[a] Department of Pedodontics and Preventive Dentistry, Tagore Dental College and Hospital, Chennai, India
[b] Department of Oral and Maxillofacial Pathology, Sree Balaji Dental College and Hospital, Bharath University, Chennai, 600100, India

Abstract
Management of white spot lesion has always been an important issue in modern dentistry. Many methods have been suggested to prevent (or) slow the demineralization of enamel as soon as white spot lesion begins to appear. The following article illustrates the use of a novel approach to treat smooth surface non cavitated white spot lesions microinvasively based on infiltration of enamel caries with low viscosity light cure resin through infiltration. This treatment aims upon both the prevention of caries progression and improving esthetics by diminising the opacity.

Abstract
The treatment of the mucogingivalproblems is one of the main objectives of the periodontal therapy. The insufficient or absent attached gingival increases the risk of development of gingival recessions. The classical grafting procedures cannot offer a solution for coverage of a larger than 3 teeth recipient area. The strip technique for free gingival graft avoids the limitations of the palatal donor area and decreases the number of surgical procedures required for augmentation of the attached gingival tissues.

Abstract
Syndrome literally means running together and it refers to collection of signs, to groups of symptoms, and to mixed assortments of signs and symptoms.The term refers to a group of manifestations when cause is poorlyunderstood.Some use the term syndrome for multiple anomalies of genetic origin. It is of paramount significance that the clinical features of syndromes especially those relating to maxillofacial and oral manifestations have a promising role to play in diagnosis.

Abstract
Perceptionis the consciousmentalregistration of a sensorystimulus. It involves interpretation of often ambiguous, insufficient, or overwhelming information in the light of your knowledge, beliefs, goals and expectations. Proprioception means" awareness of oneself"2.It keeps us aware of the position of the body, extremities, mandible etc proprioceptor impulses participate in reflex adjustments. They are group of enteroreceptors that provide information regarding the position of parts of body in space and the receptors of posture and movements .They are highly specialized types of mechanoreceptor (consist of the terminal dendrites of sensory neurons and are encapsulated in structures of connective tissue or free) responding to tension or movement included by associated structures.

Abstract
Management of uncooperative children in the dental office has been a challenge to the profession which can be overcome by rendering treatment under General Anaesthesia. Oral Rehabilitation of children under General Anaesthesia is beneficial but one must keep in mind the physiological differences as child is not a miniature adult. This paper focusses on these differences, benefits and principles of General Anaesthesia in children.

Abstract
It has been accepted that no foreign material placed within the living body is completely compatible currently there are many types of biomaterials used for the dental implants. The clinician should have adequate knowledge of these material to select an appropriate material to be used , which directly influences the success and longevity of the treatment. This paper reviews various biomaterials that are used in dental implants.

Effect of electro magnetic field (EMF) on dental amalgam and general health
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 625-629.

DOI: 10.13005/bpj/759

[a] Department of Conservative Dentistry and Endodontics, Tagore Dental College, Chennai, 600127, India

Abstract
Electromagnetic radiation (EMR) is energy in waves emitted from a source. This energy is both electric and magnetic. Electromagnetic radiation from a source penetrates the surrounding area, creating an electromagnetic field (EMF). It affects the behavior of objects in the vicinity of the field. This includes the amalgam fillings in particular and other metal restorations and components of prosthesis and appliances and the dental implants. Even humans beings are store house of different bio-electrical fields. The muscles and hence the body move and different organs like heart function due to the bio electric stimulus. These bio-electrical mechanism which smoothly maintain our lives can be altered through external interfering EMR. This often results in varying types of stress one suffers. This article is about a true health incidence that happened to an acquaintance of mine and I think all practicing dentists should be aware of such conditions in the current Hi-Tech world. I assure that this article is worthy of your time and it is sure to kindle your brains.

Abstract
Supernumerary tooth is a developmental anomaly. They can be seen as erupted or embedded in the alveolar bone. They are classified based on their shape, size and location and can be diagnosed clinically or radiographically. These are most commonly seen in maxillary anterior region. Their management varies according to their position. This article overviews a case report in maxillary anterior region.

Aggregatibacter actinomycetemcomitans: Its role in periodontitis
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 249-252.

DOI: 10.13005/bpj/685

[a] Department of Periodontics, Tagore Dental College and Hospital, Rathinamangalam, Chennai, India
[b] Department of Periodontics, Sree Balaji Dental College and Hospital, Bharath University, Chennai, 600100, India

Abstract
Strong evidence is available on the role of Aggregatibacteractinomycetemcomitans (A.a) as the causative agent of localised juvenile periodontitis(LJP), a disease characterised by rapid destruction of the tooth-supporting tissues. This organism possesses a large number of virulence factors with a wide range of activities which enable it to colonise the oral cavity, invade periodontal tissues, evade host defences, initiate connective tissue destruction and interfere with tissue repair. Adhesion to epithelial and tooth surfaces is dependent on the presence of surface proteins and structures such as microvesicles and fimbriae. Invasion has been demonstrated in vivo and in vitro. The organism has a number of means of evading host defences, which include: (i) production of leukotoxin; (ii) producing immunosuppressive factors; (iv) secreting proteases capable of cleaving IgG; and (v) producing Fc-binding.

Abstract
Periodontal disease is the most widespread and prevalent disease in the world which involves complex interactions between plaque microorganism and host immune system resulting in the loss of periodontal structures surrounding the tooth. Till recently the disease was thought to be caused by environmental factors, but now research is pointing to genetic causes of many of these diseases. Researchers are trying to identify the genetic mutations or polymorphism in respect to the various aspects of immunity. This article is a review of the monogenic disorders are caused by mutation of single gene and referred to as single gene disorders and polygenic alterations at multiple areas of the genes, each with a small contribution and is called polymorphism, that are influenced by environmental and behavioral factors.

Abstract
Massive osteolysis is a rare condition of unknown aetiology resulting in progressive destruction of bony structures. Literature reviews suggest less than 40 cases of massive osteolysis in the jaws has been reported.Clinically it is seen mostly between age groupof 18-40 years and depending on the site of involvement is shows various clinical presentation. Even after so many advances in the field of medicine still this disease is still considered as nightmare for the pathologist as the course of the diseaseand prognosis after treatment are unpredictable. As its name indicates its radiological features varies from slow resorption of affected bone finally resulting in complete loss of affected bone.No specific treatment is proven effective against this disease. Hence the purpose of this review is to provide comprehensive in depth idea about the disease to help in early diagnosis.

Abstract
Psychological condition, particularly stress have been implicated as a risk indicator of many inflammatory diseases including periodontal disease. Stress and psychosomatic disorders causes changes in interactions among nervous, endocrine and immune system. It results in delayed healing of the connective tissues and bone, apical migration of the junctional epithelium and formation of periodontal pocket.Thispaper describe aoverview of association between stress and periodontium and stress interaction with immune system.

A-one stage corticotomy assisted orthodontic technique for accelerated retraction
(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 597-601.

DOI: 10.13005/bpj/754

[a] Tagore Dental College and Hospital, Chennai, India
[b] Department of Orthodontics, Sree Balaji Dental College and Hospital, Bharath University, Pallikaranai, Chennai, 600100, India

Abstract
Bimaxillary protrusion is a condition warranting retraction of upper and lower incisor for optimizing their axial inclination to obtain lip competency and for straightening the profile. These cases generally require maximum conservation of anchorage since the entire retraction space must be utilized for retracting the incisors with protracted treatment time. Demineralization of a thin layer of bone over a root prominence after corticotomy surgery can optimize the response to applied orthodontic forces. The current technique employed a modified stage of corticotomy procedure which utilizes the principle of Regional acceleratory phenomenon, in addition Demineralized freeze dried bone was also used to augment the periodontal apparatus. The current modification is relatively simple, less invasive and can be done under local anesthesia as an outpatient procedure. The results conclusively prove that selective alveolar decortication is effective for retraction, reduces the retraction time by half in addition to conserving anchorage.

Author Keywords

Abstract
The earliest possible restoration to achieve proper form and function is a hallmark of all surgical specialties. This principle underlies the concept for immediate loading of dental implants. The concept of immediate loading was applied in the very early stages of dental implants. The failure rate of the earliest trials of dental implants was high and often occurred shortly after attempts at functional loading. In some cases the complications arising from the early loading of dental implants were more severe than the indication for treatment. Despite these setbacks, many of the early attempts at implant placement were functional for long periods and provided the support for functional prostheses. Several factors contributed to the high early failure rates: metallurgic properties of implants had not yet been improved; the dental materials utilized, although proven compatible, lacked the necessary strength to support prosthesis in function; and there was not yet a thorough understanding or the proper surgical and prosthetic techniques necessary for success.

Abstract
Recognition and diagnosis of the general oral manifestations and specific periodontal manifestations of HIV infection will continue to be a major responsibility of the dental practitioner. By combining local and systemic therapy aimed at both preventing and treating oral lesions and periodontal diseases, combined with new systemic antiviral and vaccine therapies, dental and medical practitioners may together help reduce both the dental morbidity and the overall patient morbidity in the HIV infected patient. With the advent of newer pharmacological approaches to the treatment of human immunodeficiency virus (HIV) infection, the incidence and progression of both atypical and conventional periodontal diseases are changing. While the accepted approaches to treating the spectrum of periodontal diseases in HIV patients remain essentially unchanged over the past 15 years, the impact of newer systemic therapies on patient immunocompetence may influence treatment decisions.

Author Keywords

Risk factors associated with periodontal diseases: A review

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 233-236. Cited 1 time.

DOI: 10.13005/bpj/681

Abstract
Periodontal diseases are a group of chronic infections caused by pathogenic bacteria colonizing the periodontium. Initiation and progression of periodontal infections are affected by local and systemic conditions. The local factors include dental plaque and plaque retentive areas such as dental calculus and defective restorations. Systemic risk factors include poorly controlled diabetes mellitus and tobacco smoking. Systemic conditions associated with immunodeficiency state such as neutropenia, AIDS/HIV infections are also important risk factors. Recent studies have revealed several potentially important periodontal risk indicators. These include stress and coping behaviors and osteopenia associated with estrogen deficiency. There are also demographic factors associated with periodontal disease including gender, and hereditary factors.

Abstract
An association between oral disease/periodontitis and rheumatoid arthritis (RA) has been considered for more than a century. RA is considered as an autoimmune disease whereas periodontitis has an infectious etiology with a complex inflammatory response. Inspite of the controversial etiology, both diseases are chronic and may present with bursts of disease activity. Genetic factors are driving the host responses in both RA and periodontitis. The inflammatory events are regulated by Tumor necrosis factor -A, a proinflammatory cytokine, in both RA and periodontitis. Porphyromonas gingivalis is a common pathogen in periodontal infection. P. gingivalis has also been identified in synovial fluid. The specific abilities of P. gingivalis to citrullinate host peptides by proteolytic cleavage at Arg-X peptide bonds by arginine gingipains can induce autoimmune responses in RA through development of anticyclic citrullinated peptide antibodies. In addition, P. gingivalis carries heat shock proteins (HSPs) that may also trigger autoimmune responses in subjects with RA. Data suggest that periodontal therapies combined with routine RA treatments further improve RA status. This review enlightens the link between periodontitis and rheumatoid arthritis.

Abstract
One of the most common and significant tumour of odontogenic origin affecting the jaws is ameloblastoma. Even though it is considered a benign tumour, in certain cases it can lead to significant morbidity and even lead to mortality. A distinct yet less frequent type of ameloblastoma which resembles a cyst more than a tumour is Unicystic ameloblastoma (UCA), which has characteristic histopathological, clinical and radiographic features. A review of the literature is presented to help better understand the various types of UCA with a view to proper management.

Abstract
In the last 10 years, the use of saliva as a diagnostic fluid has become somewhat of a translational research success story. Technologies are now available enabling saliva to be used to diagnose disease and predict disease progression. This review describes some important recent advances in salivary diagnostics and its application in various systemic diseases .This review will also stimulate future research activity.

Genes in tooth development

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 133-138.

DOI: 10.13005/bpj/664

[a] Tagore Dental College and Hospital, India
[b] Department of Oral Pathology and Microbiology (COCPAR), SreeBalaji Dental College and Hospital, Bharath University, Chennai, India

Abstract
Teeth form as epithelial appendages such as hairs and glands. During development, reciprocal and sequential epithelial-mesenchymal interactions regulate processes such as proliferation, differentiation and morphogenesis. These interactions are mediated by conserved signaling pathways that are reiteratively used during development of all organs. Mutations in genes encoding molecules in the signaling pathways cause numerous abnormalities in craniofacial bones and teeth including missing or supernumerary teeth, and disturbances in formation of dentin and enamel. This article is regarding the genetic basis of tooth development, methods used to study it, and the genes that have been definitively implicated in the development of human dentition and the brief notice on the deformities caused due to the mutation of the these genes.

Author Keywords

Abstract
In recent years, a trend toward implementing treatment plans that achieve immediate facial change has arisen. In "Surgery First" treatment plans, the presurgical orthodontic treatment phase is eliminated or greatly reduced, the jaws are surgically repositioned into the desired locations, and orthodontic tooth movement follows. This clinical case typically exemplifies the effect of Anterior segmental maxillary osteotomy and Mandibular anterior subapical osteotomy on improving the skeletal, dental, soft tissue and over all aesthetics of the patient.

Abstract
In the present report, a case of 19 year-old monozygotic twin sisters with variable expression of hypodontia is presented. One of the twins had agenesis of mandibular lateral incisor. The occurrence of dissimilarity in the tooth agenesis in the monozygotic twins may suggest the influence of epigenetic factors in their etiology. DNA fingerprinting was used to confirm monozygosity.

Author Keywords
Epigenetics; Hypodontia; Missing mandibular lateral incisors; Monozygotic twins

Index Keywords
dental amalgam, DNA, DNA fragment; adult, Article, blood sampling, case report, DNA determination, DNA fingerprinting, environmental factor, epigenetics, female, gel electrophoresis, genetic analysis, health status, heredity, human, hypodontia, incisor, molar tooth, monozygotic twins, mouth examination, orthodontics, panoramic radiography, polymerase chain reaction, short tandem repeat, silver staining, young adult

Chemicals/CAS
dental amalgam, 8049-85-2; DNA, 9007-49-2

Abstract
HIV is a devastating global challenge to the mankind.This paper discusses the importance of oral lesions as indicators of infection with human immune deficiency virus and as predictors of progression of HIV disease to Acquired Immuno Deficiency Syndrome(AIDS).Oral manifestations are the earliest and most important indicators of infection with HIV.The presence of oral lesions can have a significant impact on health related quality of life.It is important that all health care workers receive education and training on the importance of oral lesions in HIVand the use of oral lesions as surrogate markers of progression of the disease.

Effect of diabetes in osseointegration of dental implant -A review

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 353-358. Cited 1 time.

DOI: 10.13005/bpj/703

[a] Department of Oral Pathology, Tagore Dental College, Chennai, 600127, India
[b] Department of Oral Pathology, Sree Balaji Dental College and Hospital, Bharath University, Pallikaranai, Chennai, 600100, India

Abstract
Diabetes Mellitus is a pandemic metabolic disease prevailing globally and is characterized by chronic hyperglycemia due to absolute or relative deficiency of insulin. It affects most parts of human body including the oral cavity. The review describes the effect of diabetes in the process of osseointegration of implants in oral cavity.

Author Keywords
Diabetes in osseointegration; Implants; Oral cavity

Index Keywords
alloxan, antibiotic agent, chlorhexidine, insulin, streptozocin; alloxan-induced diabetes mellitus, antibiotic therapy, autonomic neuropathy, bone development, bone regeneration, cardiovascular disease, cerebrovascular disease, diabetes mellitus, diabetic foot, diabetic nephropathy, diabetic neuropathy, diabetic patient, diabetic retinopathy, drug efficacy, foot disease, fracture healing, glycemic control, human, hyperglycemia, insulin dependent diabetes mellitus, mouth cavity, non insulin dependent diabetes mellitus, nonhuman, ossification, osteoblast, peripheral neuropathy, peripheral occlusive artery disease, postoperative infection, Review, streptozotocin-induced diabetes mellitus, surgical risk, tooth implant, tooth implantation

Chemicals/CAS
alloxan, 3237-50-1, 50-71-5; chlorhexidine, 3697-42-5, 55-56-1; insulin, 9004-10-8; streptozocin, 18883-66-4

Therapeutic chewing gums: Review

(2015) *Biomedical and Pharmacology Journal*, 8SE, pp. 91-97.

DOI: 10.13005/bpj/656

[a] Department of Pedodontics and Preventive Dentistry, Tagore Dental College and Hospital, India
[b] Department of Oral Pathology and Microbiology(COCPAR), SreeBalaji Dental College and Hospital, Bharath University, Chennai, India

Abstract
Chewing gums are mobile drug delivery systems. It is a potentially useful means of administering drugs either locally or systemically via, the oral cavity. The medicated chewing gum has through the years gained increasing acceptance as a drug delivery system. Several ingredients are now incorporated in medicated chewing gum, e.g. Fluoride for prophylaxis of dental caries, chlorhexidine as local disinfectant, nicotine for smoking cessation, aspirin as an analgesic, and caffeine as a stay alert preparation. MCGs are solid, single dose preparations with a base consisting mainly of gums that are intended to be chewed but not swallowed. They contain one or more active substances which are released by chewing and are intended to be used for local treatment of mouth diseases or systemic delivery after absorption through the buccal mucosa.

Author Keywords
Chewing gums; Medicated; Oral; Smoking

Index Keywords
chlorhexidine, fluoride, inorganic salt, probiotic agent, urea; cheek mucosa, chemical composition, chewing gum, dental caries, drug delivery system, human, mouth mucosa, Review, smoking cessation

Chemicals/CAS

Do personality traits such as impulsivity and hostility-aggressiveness predict severity of intent in attempted suicide? Findings from a record based study in South India

(2015) *Indian Journal of Psychological Medicine*, 37 (4), pp. 393-398. Cited 18 times.

DOI: 10.4103/0253-7176.168563

Abstract
Background: Little is known about the association of personality traits with intent in attempted suicide. Aims: Our objectives were to assess the levels of selected personality factors among suicide attempters and to examine their association with suicide intent. Materials and Methods: A chart review of 156 consecutive suicide attempters was carried out. All participants were administered the Beck Suicide Intent Scale, Barratt Impulsivity Scale-11, Buss-Perry Aggression Questionnaire, and Past Feelings and Acts of Violence Scale to assess suicide intent, trait impulsivity, hostility-aggression, and violence, respectively. Pearson's product moment correlation was the used as the test of association. Stepwise linear regression was used to identify predictors of suicide intent. Results: Suicide intent was significantly correlated with verbal aggression (Pearson r = 0.90, P = 0.030), hostility (Pearson r = 0.316, P < 0.001), and nonplanning impulsivity (r = -0.174, P = 0.049). High hostility and low motor impulsivity emerged as significant predictors of suicide intent. Conclusion: Personality traits such as hostility and to an extent, impulsivity are accurate predictors of intentionality in attempted suicide. Clinicians should focus on these personality attributes during a routine evaluation of suicide attempters. They can also be considered as potential targets for suicide prevention programs.

Abstract

II-VI semiconductor nanotubes are a recently developed class of nanomaterials whose unique photophysical properties are helping to create a new generation of nanomaterials in the field of photonics and microelectronics. In this report, we examine the progress in adapting these nanomaterials for several optoelectronics applications followed by characterization studies. Magnesium oxide and silver oxide (MgO:AgO) nanoparticles were synthesized using a hydrothermal method by taking magnesium nitrate, silver oxide and glycine. X-ray diffraction (XRD) results showed that the peaks are consistent with a pure phase cubic structure of MgO. The XRD pattern also confirmed the crystallinity and phase purity of the sample. Nanocrystal sizes were found to be up to 25 nm as revealed by XRD and HRTEM. Photoluminescence measurement (PL) reveals the systematic shift of the emission band towards lower wavelength thereby ascertaining the quantum confinement effect. © 2015 The Royal Society of Chemistry.

Abstract
Development of Personal Computers and Cloud Computing, Internet of Things is making duplicating the data very feasible. In this paper we are proposing visible watermarking using FPGA which provides one to one compound mapping that allows reversible watermarking. This method can be applied for different types of host images like binary, opaque monochrome and translucent full color ones. The ultimate objective of the research is to develop low power, high performance, real-time, reliable and secured watermarking system which can provide robustness over certain attacks namely cover-up attack, cropping noise, scaling and geometric attacks. © 2015 IEEE.

Abstract
Medicinal efficacy of most of the ayurvedic and siddha preparations is time tested. Patolakaturohinyadi kwatham is a known medicine for anorexia, vomiting, skin diseases, jaundice, viral infections and liver diseases. Phytochemical and GC MS analytical study was conducted on this medicine. It was observed that saponin was present in all the three extracts whereas phytochemicals like steroids, amino acids, flavonoids, coumarins and carbonyl compounds were absent in all the three extracts. The GC MS analysis revealed the presence of some very important bio molecules like Propanoic acid 3, 3'-thiobis-didodecyl ester, Piperine, Ergosterol, 1 H- Imidazole, 1-(1-oxooxtadecyl)-derivative,Trideca-1,7,11-triene-1,1-dicarbonitrile,4,8,12-trimethyl derivative and Cyclopropanecarboxylic acid undec-2-enyl ester, which have known medicinal properties. These results substantiate the medicinal effects of Patolakaturohinyadi kwatham as claimed by Ayurveda. © Copyright protected.

Abstract
Background: Exfoliated oral cancer cells in saliva samples from patients with oral squamous cell carcinoma (OSCC) can be used to determine the incidence and type of mutations of the p53 tumor suppressor gene. The purpose of this study was to identify C-deletion mutation in exon 4 codon 63 of p53 gene in the saliva of OSCC patients by polymerase chain reaction (PCR). Materials and Methods: Saliva samples of 20 newly histopathologically diagnosed OSCC patients and 5 healthy volunteers were subjected to isolation of the total genomic DNA and PCR amplification for C-deletion on exon 4 of p53 gene. The resulting products were resolved by agarose gel electrophoresis, viewed and photographed on ultraviolet-transilluminator. Results: The relationship between the frequencies of genetic alterations was assessed by Chi-square test. Differences with values of $P < 0.05$ were statistically significant. Conclusion: The study concluded a 100% presence of C-deletion mutation in exon 4 codon 63 of p53 in the saliva of OSCC patients. This study suggests that detection of mutation in exon 4 codon 63 of p53 by PCR is a fast, reliable, accurate, and sensitive molecular method for OSCC diagnosis.

Abstract

Growing demand for ideal materials in biomedical field not only explores novel approaches, but also examines how existing resources can be modified to fit the requirements. This strategy resulted in the development of various surface modification techniques to improve the biocompatibility of materials already in use. Although various methods are available, the concept of using biological substances for improving biocompatibility seems rational and effective because of the bio-friendly surface that they present which is closer to mimicking the innate environment. Some common biomolecules like proteins, lipids, carbohydrates and peptides are extensively applied on material surfaces through innovative mechanisms. This review will help us to keep abreast of the different types of coating methodologies used and the importance of biological substances as coating alternatives for improving the biocompatibility of polymers. Further, it will also encourage the development of these techniques to modernise materials to make them a more putative choice for biomedical applications. © The Royal Society of Chemistry 2015.

Clinico-microbiological investigation of catheter associated urinary tract infection by enterococcus faecalis: VanA genotype

(2015) *Journal of Clinical and Diagnostic Research*, 9 (8), pp. DD05-DD06. Cited 10 times.

DOI: 10.7860/JCDR/2015/13856.6378

Abstract

Prolonged hospitalization and exposure to third generation cephalosporins are reported to facilitate the acquisition and colonization of Vancomycin Resistant Enterococci (VRE). Though VRE is not uncommon in India, urinary tract infection with a vanA genotype is a cause of serious concern as VRE co-exhibit resistance to aminoglycosides. In India, majority of the VRE isolates recovered from hospitalized patients include Enterococcus faecium. We report a case of catheter associated urinary tract infection by an endogenous, multidrug resistant E. faecalis of vanA genotype following prolonged hospitalization, ICU stay, catheterisation and exposure to 3G cephalosporin and metronidazole. The patient responded to linezolid therapy. © 2015, Journal of Clinical and Diagnostic Research. All Rights Reserved.

Association between personality factors and suicide intent in attempted suicide: Gender as a possible mediator?
(2015) *Personality and Mental Health*, 9 (3), pp. 220-226. Cited 3 times.

DOI: 10.1002/pmh.1300

[a] Department of Psychiatry, Jawaharlal Institute of Post Graduate Medical Education and Research (JIPMER), Puducherry, India
[b] Department of Psychiatry, Sree Balaji Medical College and Hospital (SBMCH), Chennai, India

Abstract
Background: Gender appears to be a factor closely related to key suicide-related constructs. Aims: The study aims to assess gender differences in personality factors among suicide attempters and to examine the role of gender in mediating the relationship between suicide attempts and selected personality attributes in the same group. Methods: A chart review of 156 consecutive suicide attempters was carried out. All participants were administered the Beck Suicide Intent Scale (BSIS), Barratt Impulsivity Scale-11 (BIS-11), Buss-Perry Aggression Questionnaire (BPAQ) and Past Feelings and Acts of Violence (PFAV) Scale. Results: The suicidal intent and impulsiveness did not differ significantly between men and women, although men had significantly greater PFAV scores (t=3.361, p=0.001). BPAQ showed a significant difference between the genders (F=3.621, p=0.008; Wilk's Λ=0.950, partial η2=0.100), mainly for physical aggression (F=11.006; p=0.001; partial η2=0.076) and anger (F=4.298; p=0.040; partial η2=0.031). Conclusion: Certain differences seem to be present between Indian male and female suicide attempters with regard to baseline personality attributes and their role in predicting suicide intent. The import of personality traits as potential targets for suicide prevention is worth exploring further. © 2015 John Wiley & Sons, Ltd.

Abstract
Lead Titanate (PbTiO3) is a category of the practical semiconductor metal oxides, which is widely applied in various scientific and industrial fields because of its catalytic, optical, and electrical properties. PbTiO3 nanocrystalline materials have attracted a wide attention due to their unique properties. PbTiO3 nanocrystals were investigated by X-ray diffraction (XRD) to identify the PbTiO3 nanocrystals were composed a tetragonal structure. The diameter of a single sphere was around 20 nm and the diameter reached up to 3 μm. The chemical composition of the samples and the valence states of elements were determined by X-ray photoelectron spectroscopy (XPS) in detail. © 2015 Published by Elsevier B.V.

Abstract
Abstract The solvothermal reaction of cerium oxide (CeO2) in ethanol by using cetyltriethylammonium bromide (CTAB) as surfactant resulted in the formation of hexagonal cubic shaped CeO2 nanofibers. Low concentration of CTAB in ethanol was conductive for the formation of CeO2 nanofibers. The Fourier transform infrared (FTIR) spectroscopic analysis showed a standard peak of CeO2 at 541 cm-1. The as-synthesized products were characterized by high resolution transmission electron microscopy (HRTEM) and room temperature Photoluminescence (PL) studies. The chemical composition of the samples and the valence states of elements were determined by X-ray photoelectron spectroscopy (XPS) in detail. © 2015 Published by Elsevier B.V.

Abstract
This study we reports for the first time on the synthesis and optical characteristics of free standing diamond-like carbon (DLC) deposited by pulsed laser deposition (PLD) onto graphene buffer layers for ultrahigh intensity laser based electron/proton acceleration applications. The fingerprint techniques of micro-Raman, UV-VIS-NIR and the IR spectroscopic investigations indicate that the suitability of such free standing DLC thin-films within the laser window and long wave infrared (LWIR) spectral range and hence their appropriateness for the targeted applications. ©2015 Published by Elsevier B.V.

Study of removal of speckle noise from OCT images
(2015) *Biomedicine (India)*, 35 (3), pp. 313-317. Cited 1 time.

[a] Department of Electronics and Control Engineering, Sathyabama University, Chennai, 600 119, India
[b] Department of Biomedical Engineering, Bharath University, Chennai, 600 073, India

Abstract
Introduction: In the field of biomedical imaging, optical coherence tomography images are used for retinal tissues disorder characterization. It uses the principle of low coherence interferometry to perform a depth resolved axial scan of human retina. Speckle is modeled as a signal dependent noise, which tends to reduce the image quality. OCT images suffer from speckle noise which reduces image contrast. Most of speckle reduction techniques have been studied by researchers and found that Filtering technique is one of the common methods which are used to reduce the speckle noises. Aim: In this paper, OCT images are taken as study under test and noise removal algorithms are applied for speckle noise reduction in retinal OCT imagery. This work highlights and compares different speckle reduction filters quantitatively using simulated imageries. Materials and Method: Generally speckle noise is a granular noise and commonly found in synthetic aperture radar images (SAR) and medical images. The presence of speckle noise affects image interpretation and degrades the quality of the medical images. Various filters were tested for speckle affected OCT image and the performance factors of these filters were evaluated in terms of Mean Square Error (MSE), Signal to Noise Ratio (SNR), and Peak Signal to Noise Ratio (PSNR). Image smoothening is used for enhancing the OCT images corrupted by speckle noise. Two domains used for image processing under enhancement. First was frequency domain and second was spatial domain. Results: Different filters are used in both the domains for comparative study of performance factors. Finally Gaussian Filter has been selected as the best filters for the removal of speckle noise from OCT images. The response of the filter varies locally with the co-efficient of variation.

Phosphodiesterase-5 inhibitors for erectile dysfunction in patients with diabetes mellitus: A systematic review and meta-analysis of randomized controlled trials

(2015) *Indian Journal of Endocrinology and Metabolism*, 19 (4), pp. 451-461. Cited 23 times.

DOI: 10.4103/2230-8210.159023

Abstract

Background and Aims: Patients with diabetes mellitus frequently experience erectile dysfunction. This systematic review and meta-analysis were conducted to find efficacy and tolerability of phosphodiesterase 5 (PDE5) inhibitors in patients with diabetes mellitus experiencing erectile dysfunction. Methodology: Electronic searches were carried out to identify English language peer-reviewed randomized controlled trials (RCTs), which reported clinical efficacy of any PDE5 inhibitor in patients with diabetes mellitus having erectile dysfunction. Effect sizes were computed using Cohen's d, and I 2-test was used to assess heterogeneity. Pooled mean effect sizes were computed using random-effects model. Number needed to treat (NNT), and the adverse event rates were computed. Results: The systematic review included a total of 17 studies yielding 25 comparisons. Three studies were open RCTs while others were double-blind RCTs. The pooled mean effect size of any PDE5 inhibitor over placebo was 0.926 (95% confidence intervals [CI]: 0.864-0.987; I 2 =26.3). The pooled mean effect size for sildenafil was 1.198 (CI: 1.039-1.357; I 2 =), for tadalafil was 0.910 (CI: 0.838-0.981; I 2 =33.6), and for vardenafil was 0.678 (CI: 0.627-0.729; I 2 =). In pooled analysis, the NNT for sildenafil, tadalafil, vardenafil and any PDE5 inhibitor was 2.4, 2.6, 4.1 and 3.0 respectively. The most common side effects were headache, flushing, and nasal congestion. Conclusions: PDE5 inhibitors are effective and safe medications for the treatment of sexual dysfunction in patients with diabetes mellitus experiencing erectile dysfunction.

Abstract
Forensic science deals with examining and gathering information related to an accident or a crime scene. The contribution of prosthodontics to forensic odontology is highly significant after the invention of denture labeling techniques. Personal identification is inevitable in case of accident, loss of memory, state of unconsciousness and in hospitals. Labeled dentures can remarkably help identify the dead after disasters and accidents. Since then various denture markers were described in literature. This case report highlights an alternative technique of denture identification wherein a quick response code (QR code) is incorporated into the processed denture using a clear acrylic sheet instead of self cure acrylic resin. © 2015, Jaypee Brothers Medical Publishers (P) Ltd. Abstract
Obstructive sleep apnea (OSA) and obstructive sleep apnea syndrome (OSAS) are subsets of sleep-disordered breathing. Awareness about OSA and its consequences among the general public as well as the majority of primary care physicians across India is poor. This necessitated the development of the Indian initiative on obstructive sleep apnea (INOSA) guidelines under the auspices of Department of Health Research, Ministry of Health and Family Welfare, Government of India. OSA is the occurrence of an average five or more episodes of obstructive respiratory events per hour of sleep with either sleep-related symptoms or co-morbidities or ≥15 such episodes without any sleep-related symptoms or co-morbidities. OSAS is defined as OSA associated with daytime symptoms, most often excessive sleepiness. Patients undergoing routine health check-up with snoring, daytime sleepiness, obesity, hypertension, motor vehicular accidents, and high-risk cases should undergo a comprehensive sleep evaluation. Medical examiners evaluating drivers, air pilots, railway drivers, and heavy machinery workers should be educated about OSA and should comprehensively evaluate applicants for OSA. Those suspected to have OSA on comprehensive sleep evaluation should be referred for a sleep study. Supervised overnight polysomnography is the "gold standard" for evaluation of OSA. Positive airway pressure (PAP) therapy is the mainstay of treatment of OSA. Oral appliances (OA) are indicated for use in patients with mild to moderate OSA who prefer OA to PAP, or who do not respond to PAP or who fail treatment attempts with PAP or behavioral measures. Surgical treatment is recommended in patients who have failed or are intolerant to PAP therapy.

Author Keywords
Bariatric surgery; continuous positive airway pressure; Indian guidelines; obstructive sleep apnea; obstructive sleep apnea syndrome; polysomnography; sleep apnea; sleep study; syndrome Z

Index Keywords
armodafinil, modafinil; anthropometry, Article, awareness, bariatric surgery, body position, consensus, Epworth sleepiness scale, evidence based practice, home monitoring, human, Indian, mandibular repositioning appliance, medical history, mortality, oral appliances therapy, pathogenesis, physical examination, polysomnography, positive end expiratory pressure, practice guideline, prediction, preoperative evaluation, randomized controlled trial (topic), risk factor, sleep disordered breathing, titrimetry, tongue retaining appliance

Chemicals/CAS
armodafinil, 112111-43-0; modafinil, 68693-11-8

Oral mucosal lesions associated with smokers and chewers – A case-control study in chennai population
(2015) *Journal of Clinical and Diagnostic Research*, 9 (7), pp. 17-22. Cited 12 times.

DOI: 10.7860/JCDR/2015/14008.6169

Abstract
Aims and Objectives: To determine the association of oral mucosal lesions in a group of Chennai population aged 15 years and above with smoking and chewing habits. To also determine the dose-response relationship of these habits associated with the risk of oral mucosal lesions. Materiala and Methods: The study was undertaken with 450 subjects with smoking and/or chewing habits aged 15 years and over gathered through random selection in Chennai, India. Subjects with alcohol intake were excluded from the study. Based on the habits the study group was categorized into smokers, chewers and mixed (smoking+chewing). One hundred and fifty subjects diagnosed with oral mucosal lesions designated as “cases” and 300 lesion-free “controls”, frequency matched for age, sex, habit and family income were assessed during the study. The study protocol included a visual oral soft tissue examination and a questionnaire-based interview. In addition, those requiring further examination, scalpel biopsies were performed to establish a definitive diagnosis. R esults: Irrespective of the type of habit, 78% of cases smoked and/or chewed for more than 10 years as compared to 37.4% of the control group. Similarly, 71.3% of cases smoked and/or chewed more than 5 times per day as compared to 25.6% of the control group. Eleven habits related mucosal lesions of the oral cavity were encountered. Smoker’s melanosis was the most common oral mucosal lesion followed by Oral submucous fibrosis and Leukoplakia. Dose-response relationships were observed for both duration and frequency of habits on the risk of oral mucosal lesions. C onclusion: The result of the present study provides information on the association of oral mucosal lesions in smokers, chewers and patients with mixed habits. The mucosal lesions encountered included a few potentially malignant conditions and oral squamous cell carcinoma. Habits were more prevalent in men thus more lesions were encountered in males than in females. Moreover, increase in the duration and frequency of habits was significant predictors of risk in the case population. © 2015, Journal of Clinical and Diagnostic Research. All rights reserved.

Abstract
ZnO nanorods and Cu doped ZnO nanorods thin films have been prepared by simple hydrothermal method. CdS quantum dots are sensitized with Cu doped ZnO nanorod thin films using successive ionic layer adsorption and reaction (SILAR) method. The X-ray diffraction study reveals that ZnO nanorods, and CdS quantum dot sensitized Cu doped ZnO nanorods exhibit hexagonal structure. The scanning electron microscope image shows the presence of ZnO nanorods. The average diameter and length of the aligned nanorod is 300 nm and 1.5 μm respectively. The absorption spectra shows that the absorption edge of CdS quantum dot sensitized ZnO nanorod thin film is shifted toward longer wavelength region when compared to the absorption edge of ZnO nanorods film. The conversion efficiency of the CdS quantum dot sensitized Cu doped ZnO nanorod thin film solar cell is 1.5%. ©2015 Elsevier Ltd. All rights reserved.

Abstract
L-Ornithine Monohydrochloride (LOMHCL) has been investigated with the help of B3LYP density functional theory with 6-31 G (d, p) basis set. Fourier transform infrared and Fourier transform Raman spectra is to identify the various functional groups. The theoretical frequencies showed very good agreement with experimental values. On the basis of the thermodynamic properties of the title compound at different temperatures have been calculated, revealing the correlations between standard heat capacities (C) standard entropies (S), and standard enthalpy changes (H) and temperatures. Second harmonic generation (SHG) efficiency of the grown crystal has been studied. © 2015 AIP Publishing LLC.

Abstract
L-Ornithine Monohydrochloride (LOMHCL) has been investigated with the help of B3LYP density functional theory with 6-31 G (d, p) basis set. Fourier transform infrared and Fourier transform Raman spectra is to identify the various functional groups. The theoretical frequencies showed very good agreement with experimental values. On the basis of the thermodynamic properties of the title compound at different temperatures have been calculated, revealing the correlations between standard heat capacities (C) standard entropies (S), and standard enthalpy changes (H) and temperatures. Second harmonic generation (SHG) efficiency of the grown crystal has been studied. © 2015 AIP Publishing LLC.

Abstract
In this article, random vibration analysis of full aircraft with passive and active landing gears has been done by numerical simulations on random runway profile. The mathematical model of full aircraft with active landing gears and modelling of runway profiles have been developed for analysing the aircraft bounce, pitch, roll accelerations, displacement and shock strut travel while taxiing on random runways. The results show that vibration levels of the aircraft by the active landing gear system is less than the conventional landing gear system while taxiing on different grades of random runways. Comparison results also show that the active system improves the ride comfort and easiness of pilot handling and thus, increases the fatigue life of the aircraft.

Abstract
Enterococcus avium is a Gram-positive facultative anaerobe, found normally in the intestinal tract of human beings, pigs and chickens. E. avium has rarely been reported as a human pathogen. This bacterium has been reported previously along with other aerobes and obligate anaerobes.We report a case of diabetic foot infection with wet gangrene caused by E. avium that had led to morbidity in a 60-year-old woman due to her ignorance regarding health and self-care skills. Pus and exudates of the diabetic foot wound were processed for anaerobic cultivation, and the pure culture obtained was subjected to nested PCR using 16S rDNA universal eubacterial primers for rapid and precise identification. The clinical isolate obtained by anaerobic incubation was identified as E. avium. Aerobic culture detected scanty growth of Proteus mirabilis. This case report highlights the pathogenic potential of E. avium in anaerobiosis in the absence of obligate anaerobe accounting for serious health burden threatening patients' quality of life. © 2015, Research Society for Study of Diabetes in India.

Comparative Effects of Clonidine and Adrenaline with Lignocaine During Maxillary Infiltration Anaesthesia for Dental Extraction

(2015) *Journal of Clinical and Diagnostic Research*, 9 (5), pp. ZC85-ZC88. Cited 6 times.

DOI: 10.7860/JCDR/2015/11066.5968

Abstract

Introduction: Lignocaine is a commonly used local anaesthetic in dental practice. Many practitioners use adrenaline (epinephrine) as additive with lignocaine, and some have used clonidine, instead of adrenaline. Both having benefits and limitations. Aims: Hence a study was undertaken in our department to evaluate the advantages and disadvantages of using (plain lidocaine local anaesthetic) versus (lidocaine with adrenaline as additive) versus (lidocaine with clonidine as additive). Study Design: Randomised, prospective, double blind study. Materials and Methods: Seventy five patients requiring extraction of maxillary molar teeth who fall under ASA I category were included and randomly divided into group I (n=25) (Lignocaine), group II (n=25) (Lignocaine ± Adrenaline) and group III (n=25) (Lignocaine ± Clonidine). The observations recorded were, time of onset of anaesthesia, hemodynamic parameters, blood loss during procedure and duration of post operative analgesia. Statistical Analysis:The statistical analysis was carried out using SPSS 16 software. Results: A statistically significant difference was seen in blood loss, being higher in group I and duration of anaesthesia, being shortest in group I. There was no statistical difference between the three groups amongst other parameters. Conclusion: Adrenaline at 10 µg/ml and clonidine at 15 µg/ml can be safely used as additives with lignocaine, in maxillary infiltration anaesthesia for dental extraction; with addition of either of these two drugs, having an equal advantage over use of plain lignocaine; in terms of lower blood loss and longer duration of anaesthesia; but, with no difference in the onset of anaesthesia and with no significant hemodynamic changes. © 2015, Journal of Clinical and Diagnostic Research. Abstract
This paper analyses the experimental and numerical investigation of heat transfer, heat transfer co-efficient and friction factor with twisted tape insert using CFD simulation. An experimental data obtained from the heat exchanger both plain tube and twisted tape inserts. The experimental setup was made with mild steel pipe on outside with 28mm inner diameter and 32mm outer diameter. The inner pipe made on aluminum tube with 18mm inner diameter and 20mm outer diameter. A uniform heat flux condition was set by electric heating coil wire wrapped around the tube section and proper Insulating is used over the entire tube length. The surface temperature of the heating coil tube value measured at four different points. The inlet and outlet temperature of the inner tube cold fluid flow was recorded with two thermocouples. The copper twisted tape were inserted with twist ratio y is 3.90 in the inner tube and takes swirling flow to enhance the heat transfer. The recorded data obtain from the CFD simulations were verified with the experimental assessment of twisted tape insert. The results shows that the considerable amount of heat transfer enhancing with several of heat transfer co-efficient and Reynolds number.

Abstract
In this paper we take four marked graphs of one basic stock control system and three kanban control systems and analyze them using sign incidence matrix.

Author Keywords
Basic stock control system; Flexible manufacturing systems; Independent extended control system; Independent Kanban control system; Marked graphs; Petri nets; Sign incidence matrix; Simultaneous Kanban control system

Index Keywords
control system, controlled study

Abstract
The mononuclear phagocyte system consists of cells that have a common lineage whose primary function is phagocytosis. The specific immunity is achieved by the combined effects of macrophages and lymphocytes, and system has been called lymphoreticular system. Reticuloendothelial system means a special group of cells, scattered in different parts of the body, but all having some common characteristics. These cells are powerful phagocytes.

Antioxidant status in neonatal jaundice before and after phototherapy
(2015) *Journal of Pharmacy and Bioallied Sciences*, 7, pp. S16-S21. Cited 16 times.

DOI: 10.4103/0975-7406.155766

Abstract
Background: Neonatal jaundice refers to yellow coloration of the skin and the sclera (whites of the eyes) of newborn babies that result from the accumulation of bilirubin in the skin and mucous membranes. Because bilirubin is potentially toxic to the central nervous system. Genetic disorders of bilirubin conjugation, particularly the common Gilbert's syndrome, can also contribute to neonatal hyperbilirubinemia. Objective: The aim of this study was to evaluate the lipid per-oxidation and antioxidant enzyme activities in patients with neonatal jaundice before and after phototherapy. Materials and Methods: The study includes 50 neonatal jaundice patients with average age 2-15 days. All patients of neonatal jaundice receiving phototherapy except feeding, cleaning. Subjects selected were from the patients attending Pediatrics Department. Plasma malondialdehyde (MDA), erythrocyte glutathione peroxidase (GPX), superoxide dismutase and catalase (CAT) to monitor the bilirubin level. Results: The results show increased levels of bilirubin compared with controls ($P < 0.001$) shows the level of plasma MDA in control, before and after phototherapy. Represents the level of GPX was significantly increased in after the phototherapy group when compared with before phototherapy and control SPSS soft ware: ($P < 0.001$). Shows the reduced glutathione (GSH) level in plasma was significantly decreased in the after phototherapy group when compared with before phototherapy and control ($P < 0.001$). And finally with ascorbic acid and CAT. Conclusion: It is evident from the study that increased oxidative stress in neonatal jaundice babies leads to decrease in the levels of antioxidants like GSH and ascorbic acid and disturb their metabolism, that weaken their ability to fight the growing stress. Intense oxidative stress and decreased antioxidants may contribute to neural cell death and alter the erythrocytomembrane structure processing in neonatal jaundice.

Abstract
Radiography can play an important part in forensic odontology, mainly to establish identification. This may take the precise form of comparison between antemortem and postmortem radiographs. Radiographs may also be taken to determine the age of a minor victim and even help in the assessment of the sex and ethnic group. Comparable radiographs are an essential factor to confirm identification in a mass disaster.

Abstract
There is increased awareness and anxiety in conducting research for publication and at the same time ignorance about getting Ethical Committee clearance at least in Anatomy Departments among Basic Medical Sciences. While people are actively presenting papers, collect data, Indian Council for Medical Research guidelines does not cover aspects pertaining to Anatomy oriented research activities. This review article is an eye opener for fraternity in the medical field, especially in anatomy.

Abstract
Background: Rheumatoid arthritis is a chronic and systemic inflammatory disorder, in which Lipoprotein (a) [Lp (a)] increases plaque formation and thus promotes atherosclerosis. Coronary artery disease is one of the co-morbidity in rheumatoid arthritis patients. Aim: The aim of this study is to evaluate Lp (a) as a cardiovascular risk factor in patients with rheumatoid arthritis. This was a comparative study in which Lp (a) and lipid profile were compared in rheumatoid arthritis patients and controls. Materials and Methods: The study included 30 sero-positive rheumatoid arthritis patients and 30 normal healthy subjects with an age and sex matched group of 25-80 years. Statistical analysis was performed using SPSS version 17. Results: Serum Lp (a) concentration was significantly increased ($P < 0.001$) in rheumatoid arthritis patients compared with controls. Serum high-density lipoprotein-cholesterol was significantly lowered ($P < 0.05$) in patients as compared to controls. There was no significant difference in serum total cholesterol, triglycerides, and very low density lipoprotein-cholesterol between patients and controls. Conclusion: The findings indicate that the patients with rheumatoid arthritis are at high risk of developing cardiovascular disease in future due to the increased level of Lp (a). In addition to conventional lipid profile, estimation of Lp (a) can prove to be a valuable tool in risk assessment of population in general and management of disease in particular.

Author Keywords

Macrolide resistance in Streptococcus species

(2015) *Journal of Pharmacy and Bioallied Sciences*, 7, pp. S26-S31.

DOI: 10.4103/0975-7406.155784

[a] Department of Microbiology, Madha Medical College, Chennai, Tamil Nadu, India

Abstract
Background: The Streptococci are Gram-positive spherical bacteria (cocci) that characteristically form pairs and chains during growth. Some macrolide-resistant bacteria lack the proper receptor on the ribosome (through methylation of the rRNA). This may be under plasmid or chromosomal control. Aim and Objectives: The aim was to study the prevalence of macrolide resistance among the isolate and evaluate the degree of resistance by minimum inhibitory concentration (MIC) method. And also to detect the phenotypic pattern of macrolide resistance. Materials and Methods: All age group attending general medicine OPD and pediatric OPD with symptoms of respiratory and pyogenic infections are included in the study. Various samples are collected with detailed case history and processed for macrolide resistance among beta hemolytic Streptococci MIC method and D-test. Results: According to our studies resistance pattern in Group A Streptococci by D-test, cMLS was 27.85%, iMLS was 13.92%, M-type was 55.69%, in GCS, cMLS was 17.6%, M-type was 82.35% In GGS, cMLS was 31.58%, iMLS was 10.53% and M-type was 57.89%. Conclusions: Therefore by this study, we would like to highlight the necessity to do antibiotic sensitivity testing for all isolates, and limit the usage of antibiotics, whenever necessary and select the appropriate antibiotics for resistant strains.

Abstract
Background: The main function of the lung is gas exchange, which can be assessed in several ways. A spirometer measures the flow and the volumes of the inspired and expired air. The thoracic and abdominal muscle strength plays an important role in pulmonary function and diffusing lung capacity. Aims and Objectives: The aim of this study was to assess the effects of formalin exposure on the pulmonary function to compare with healthy individuals. To assess the chronic effects of formalin exposure on Pulmonary function tests (PFTs) in the faculties, lab technicians and attender of the Department of Anatomy and Pathology of SRM Medical Hospital and Research Centre, Kattankulathur. Materials and Methods: This prospective study was carried out in 50 healthy formalin exposed subjects (at least 5 years exposure) from Department of Anatomy and Pathology of SRM Medical College Hospital and Research Centre, Kattankulathur and 50 healthy controls of same age group of this study were included after obtaining ethical clearance and consent 'Easy One Pro Spirometer (Ndd Medical Technologies, Cheshire SK 101LT, United Kingdom) was used to find out the PFT. Results: Student's t-test was applied to compare the PFT parameters between formalin exposed and formalin nonexposed group. There was a significant difference in mean and standard deviation of pulmonary parameters with the $P < 0.005$ in formalin exposed, which shows that they have lesser ventilatory drive. Conclusion: The formalin exposed subjects in our study presented with a mixed disorder of both obstructive and restrictive type. We also found that there was a negative correlation of pulmonary function with that of the degree and duration of exposure to formalin.

An efficient method for segmentation of CT-SCAN image using multiresolution analysis (MRA)
(2015) *Journal of Theoretical and Applied Information Technology*, 73 (1), pp. 155-162.

[a] Department of Computer Science and Engineering, Bharath University, Chennai, India
[b] School of Information Technology, Madurai Kamaraj University, Madurai, India

Abstract
Classification of the cancer region from the human organs by means of shape or gray-level information is a demanding task; organs shape varies throw diverse portions in medical heap and the gray-level intensity overlie in soft tissues. Multiresolution analysis based segmentation united with thresholding as pre- and post-processing steps permit accurate detection of ROIs. Curvelet transform is a newest extension of wavelet and ridgelet transforms which focuses on compacting with exciting experiences taking place along curves. This paper focuses on developing an automatic image segmentation method for classifying region of interest (ROI) in medical images which are achieved from various medical scanners such as PET, CT or MRI. The proposed segmentation system utilizes wavelet, ridgelet and curvelet transforms based Multiresolution analysis (MRA). Results attained for curvelet, wavelet and ridgelet transforms experimented on medical data sets are evaluated. Comparison results demonstrate that exploiting curvelet significantly develops the classification of abnormal tissues in the scans and diminish the adjacent noise. © 2005 - 2015 JATIT & LLS. A medical volume segmentation technique using 3d discrete wavelet transform (DWT)

(2015) *Journal of Theoretical and Applied Information Technology*, 73 (1), pp. 163-166.

[a] Department of Computer Science and Engineering, Bharath University, Chennai, India
[b] School of Information Technology, Madurai Kamaraj University, Madurai, India

Abstract
3D medical image segmentation focuses at separating the voxels into 3D objects (sub-volumes) which show considerable physical entities. MRA permits for the preservation of an image based on specific levels of resolution or blurring. The superiority of this system makes it important in image compression, denoising, and classification or segmentation. This paper aims at the implementation of a medical volume segmentation based on 3D MRA methods. Therefore, 3D discrete curvelet transform is proposed and evaluated with the discrete wavelet transform (DWT). An assessment study has been executed to evaluate 2D and 3D techniques which unveil that 3D approaches can exactly locate the region of interest in both phantom and real data. © 2005 - 2015 JATIT & LLS. Study of morbidity profile of a rural population in Tamil Nadu

(2015) *Journal of Clinical and Diagnostic Research*, 9 (2), pp. LC05-LC09. Cited 1 time.

DOI: 10.7860/JCDR/2015/10424.5520

[a] Department of Community Medicine, Sree Balaji Medical College and Hospital, Bharath University, Chrompet, Chennai, India
[b] Department of Community, Medicine, SRM Medical College, Hospital and Research Centre, Kattankulathur, Tamil Nadu, India

Abstract
Objective: To identify the reported morbidity profile of people according to age, gender and organ system affected using International Classification of Diseases (ICD) coding, in a demographically defined area in Tamil Nadu in order to identify their health care needs and to plan appropriate interventions strategies. Materials and Methods: This is a-cross sectional study using a convenience sample of 12308 persons sceened from the 41 panchayat units of the Kattankulathur block, comprising 90 villages with a population of about 2,00,890, over a period of one year. Diagnosis made were coded using ICD 10 version and data collected was analysed by appropriate statistical methods to explain the distribution of morbidity profile among the study population. Result: Out of total, 38.1% screened were males and 61.9% were females. Underfives were 5.3%, school going children 43.3%, adults 39.2% and elderly 12.3%. Majority had illness affecting respiratory system (20%), 'symptoms and signs' (19%), musculo-skeletal system (16.1%) and digestive system(11.9%). 'Symptoms and signs' classification, is a group of conditions which is of nonspecific diseases, signs, symptoms, abnormal findings and complaints, apart from the system specific conditions diagnosed properly and not elsewhere classified, More males were affeced with respiratory, digestive and illnesses with 'symptoms and signs' while more women were affected with musculo-skeletal problems. Only 9.7 % of patients reported with non-communicable diseases. Among them, 55 % women and 42.3 % men had osteoarthritis and 15.7 % women and 21.3 % men had cataract. About 15.8 % women and 18.1 % men had hypertension and other heart diseases while 9.7 % women and 8.4 % men had diabetes and 10.0 % men and 3.9 % women had chronic respiratory diseases. Conclusion: School going children and adults have higher levels of morbidity when compared to elderly and under five children. More females reported with illness but morbidity was found to be higher among males. The burden of illness increased with age. Acute ailments were responsible for high morbidity among children, while chronic ailments caused high morbidity among the elderly. © 2015, Journal of Clinical and Diagnostic Research. Abstract
Diamond-like carbon (DLC) coatings of 300, 500 and 650 nmthickness were deposited on stainless steel substrates using a filtered cathodic vacuum arc hybrid with magnetron sputtering system. A 100 nm thick chromium interlayer was deposited before the deposition of the DLC coatings. The films morphology was characterised by field emission scanning electron microscopy and structure was identified by Raman spectroscopy. Tribology was evaluated by ball disc wear test and wear tracks were observed by scanning electron microscopy. The interface adhesion was studied by scratch tester. The results of all characterisations were concluded and 500 nm DLC coating has suggested as optimum thickness that would be applicable for industrial applications. © 2015 Institute of Materials, Minerals and Mining.

Sterno-costo-chondro-coracoidan muscle - a case report

(2015) *International Journal of Pharma and Bio Sciences*, 6 (2), pp. B79-B83.

[a] Department of Anatomy, Sri Lakshmi Narayana Institute of Medical Sciences, Bharath University, Puducherry, India
[b] Department of Community Health Nursing, Vinayaka Missions College of Nursing, Puducherry, India

Abstract
Pectoralis minimus is a rare muscle usually found in the pectoral region. The aberrant muscle in the present report was arising from the first two costal cartilages and the second chondro-sternal joint of right side. The tendon of the muscle inserted into the superior surface of coracoid process and continued laterally to merge with coracoacromial ligament and coracohumeral ligament. This muscle was unique in its attachment and not reported previously. Pectoralis minimus may help in scapulo humeral rhythm. The knowledge of this aberrant muscle helps radiologist and surgeons in the diagnosis and surgical interventions of the area.

Behavioural changes in experimental models on long term exposure to kainic acid followed by nicotine - locomotor activity study

(2015) *International Journal of Pharma and Bio Sciences*, 6 (4), pp. B951-B956.

[a] Department of Anatomy, Bharath University, Chennai, Tamilnadu, India
[b] Department of Anatomy, ESIC Medical College and PGIMSR, Chennai, Tamilnadu, India
[c] Department of Anatomy, Sri Balaji Medical College, Chennai, Tamilnadu, India

Abstract
Long term administration of Nicotine is capable to protect the excitotoxicity and neuronal degeneration induced by Kainic acid and it's analogues in rodents. 16 adult male albino rats of wistar strain weighing 135-150 grams were used for the present study. The rats were divided in to four groups each consists of 4 animals. The control group was given 0.9% saline as vehicle and the experimental groups (group-II with 1mg/kg Nicotine; group III- Kainic acid 1mg/kg; IV- Kainic acid followed by Nicotine 1mg/kg bodyweight) were given intraperitoneal injections respectively for a period of 28 days. All the animals were utilized on last day of the experiment by using digital photoactometer to study the locomotor activity. The mean and standard deviation for the control group was 396.4683±5.802298, for Nicotine treated group was 201.4441±12.91962, Kainic acid treated group was 163.7172679±3.774917218 and Kainic acid followed by Nicotine group was 256.3096±11.44552 calculated and recorded. There was a significant locomotor activity improvement in kainic acid followed by nicotine treated group compared to kainic acid and nicotine treated groups was observed. Our study helps to understand the neuroprotective effect of nicotine on kainic acid induced excitotoxicity.

The diffusing lung capacity in formalin exposed and non exposed subjects - a comparative study
(2015) *International Journal of Pharma and Bio Sciences*, 6 (2), pp. B410-B416.

[a] Dept. of Physiology, MGMC and RC, Sri Balaji Vidyapeeth University, Puducherry, India

Abstract
The thoracic and abdominal muscle strength plays an important role in pulmonary function and diffusing lung capacity. The main function of the lung is gas exchange, which can be assessed in several ways. A Spirometer measures the flow and the volumes of the inspired and expired air. The aim of the study was to assess Diffusing Lung Capacity of formalin exposure and to compare with healthy individuals. To assess the chronic effects of formalin exposure on Diffusing lung capacity in the faculties, lab technicians and attender of the department of anatomy and pathology of SRM Medical Hospital and Research Centre, Kattankulathur. This prospective study was carried out in 50 healthy formalin exposed subjects (atleast 5 years exposure) from department of anatomy and pathology of SRM medical college hospital and research centre, Kattankulathur and 50 healthy controls of same age group of this study were included after obtaining ethical clearance and consent' Easy One Pro Spirometer was used to find out the Diffusing Lung Capacity. Student t-test was applied to compare the PFT parameters between formalin exposed and formalin non exposed group. There was a significant difference in mean and standard deviation of pulmonary parameters with the p - value < 0.005 in formalin exposed which shows that they have lesser ventilatory drive.

Abstract
Data mining methods based on support vector machine are attractive to address the curse of dimensionality. The Kernel mapping contributes a unifying frame work for most of the commonly employed models to get the linear planes in the higher dimensional space. In this paper, we prove this approach enhances the accuracy of diabetes data set. We further refine the results with parameter tuning for the selected kernels. The natural question that arises in case of many such different mappings to choose from, which is the best for a particular problem? The selection can be validated using independent test sets or variety of data sets and methods of cross validations.

Non-diabetic maternal factor with caudal regression syndrome - A novel case report
(2015) *International Journal of Pharma and Bio Sciences*, 6 (1), pp. B222-B228.

[a] Department of Obstetrics and Gynaecology, Sree Balaji Medical College and Hospital, Chennai, Tamil Nadu, 600044, India

Abstract
Caudal regression syndrome (CRS) is a rare neural tube defect which impairs thedevelopment of lower (caudal) half of the body. The spectrum of this disease can vary from isolated partialgenesis of the sacrococcygeal spine to complete absence of sacral, lumbar, or lower thoracic vertebrae. Most of the cases which are reported as the causative agent for CRS are mostly due to a diabetic maternal pattern. But there are few cases of CRS which are seen occurring even when there is no maternal diabetes or any genetic pre-disposition or influence from any kind of teratogens. Thus here we are discussing a unique case of a new born deceased infant with CRS with a clear background, that is a non-diabetic mother and no inheritance from the hereditary. We have also done karyotyping from the peripheral blood of the new born infant to identify thechromosomal anomalies which have been allied with this syndrome. Thus these preliminary as well as novel findings are beginning to shed light on this very rare syndrome in which further more researches have to be carried out to uncover the actual pathogenesis linked to this syndrome.

Abstract
Flowfield characteristics of correctly expanded subsonic and sonic jets from uncontrolled nozzle and jet with plain solid tab were compared with jet having slanted perforated tabs of different shapes. The jet with tab of slanted perforation angles of 300 of circular, elliptical in horizontal and vertical major axis and square shape were used for the experiment. Detailed Pitot pressure measurements revealed that the slanted perforation in the tab had a strong influence on the emerging flowfield. The tab with 300 slanted perforation of circular shape was found to be more efficient in disturbing the potential core in subsonic jets when compared with solid tab and other shapes of perforation in tabs considered. It was also found that it was having a slightly lesser potential core as compared to jet with solid tab. © 2016, American Institute of Aeronautics and Astronautics Inc, AIAA. All rights reserved.

Abstract
Fuzzy Petri nets are capable of concurrent, reliable specification of business rule engines of a core of an expert system. An expert system based on Fuzzy rule based systems are common and specification of those systems by tools like Petri nets encourage more research work nowadays. The focus of this paper is to establish an iterative scheme using data mining techniques for extractingantimal set of rules with best accuracies of such models is devised and obtained result for generating theoptimal rule base for predicting the diabetes diagnosis results.

Statistical Approach for Location Identification in MANET

(2015) *International Journal of Control Theory and Applications*, 8 (4), pp. 1521-1525. Cited 1 time.

[a] Department of CSC, Bharath University, Chennai, India
[b] Department of Computer Science and Engineering, GKM College of Engineering and Technology, Chennai, 600 063, India

Abstract
Localizing nodes in MANET is significant as it serves several purposes. Various issues such as routing, security and so on could be resolved if the exact the location of the nodes is known. There exist several localization techniques such as Received Signal Strength (RSS), Time of Arrival (TOA), Time Difference of Arrival (TDOA) and Angle of Arrival (AOA) and so on. But these techniques produce inaccurate location estimates. Thus in this paper a Statistical Approach for Location Identification (SALI) has been proposed to estimate the location of the mobile nodes. This technique is independent of TOA, TDOA and AOA measurements. This technique estimates the location of the mobile node with reference to the mutation point. In addition the behavior of the nodes is monitored to identify malicious node and these nodes are localized using proposed location identification approach. © International Science Press.

Abstract
The present work envisages in understanding the bio molecules present in Partharishtam by GC MS analysis and to find its antioxidant activity. Partharishtam is prepared by processing the bark of Terminalia arjuna, flowers of Madhuca indica and Woodfordia fruticosa, fruits of Vitis vinefera, jaggery and water. Partharishtam was subjected to GC MS analysis after suitable preparation. Major bio molecules such as Glycerol tricaprylate (RT value-33.104: % Area-11.44), Piperine (RT Value-33.900: % Area-6.22), Pyrazole (RT Value-32.807: % Area-5.400) were present among other compounds like 2-(3-chlorophenoxy)-N'-(2,4-dicholorobenzylidine) acethydrazide (RT value-32.307: % Area-8.83), Methyl 2-(4-chlorophenyl)-6-metoxy-7-chlorocinchoninate (RT value-31.817: % Area-1.70), 1,3-dipentyl-heptabarbital (RT value-35.003: % Area-4.44), 2-Pyrididone, 3,5-diiodo-n-methyl-1-Dimethyl derivative(RT Value-31.633: % Area-1.65), Stanzolol (RT value – 29: % Area-0.15). The various antioxidant studies of Partharishtam have indicated moderate activities when compared with standards in various methods applied. The medicinal properties of the molecules present in Partharishtam and its antioxidant properties could substantiate well with the claim that Partharishtam is a potent cardio tonic formulation. © Copyright protected.

Abstract
Semiorganic nonlinear optical crystals are expected to possess the advantages of both inorganic and organic materials. Optically active Bis-Glycine Lithium Molybdate (BGLM) is a semi-organic crystal and growth of single crystals of the prepared samples was carried out by slow evaporation method. The crystals were obtained after a period of 45 days and were subjected to various characterization studies. Powder X-ray diffraction analysis revealed the crystalinity of the grown crystal. Infrared spectral analysis showed the vibrational behaviour of chemical bonds and its functional groups and they were confirmed by FT Raman studies. UV-Visible transmittance studies revealed that the transparency region is from 320nm to 1036nm and its cut off wavelength of the grown crystal was found to be 320 nm. Optical band gap is found to be 3.25eV. The SHG efficiency of BGLM crystal is 1.5 times of KDP crystal. The dielectric response of the grown crystal was studied as a function frequency. © Research India Publications.

Abstract
Hypertension in childhood is now recognized to be a common and serious problem with a prevalence of 2% to 5%. Early detection of children at risk for hypertension, proper evaluation and appropriate management are important to prevent the serious, long-term complications associated with the condition. The present study was undertaken in this direction, to assess the prevalence of prehypertension and among school students [11 -17 years] in Puducherry. To show any possible correlation between high normal BP and increasing BMI. A total of 1100 school students consented to participate in this study, their BP reading were recorded after a demographic questionnaire to assess their socioeconomic status & BMI. Out of a total of 1100 students, there were 31 [4.97%] boys & 14 [3.09 %] girls. boys and girls both systolic and diastolic blood pressure increases with weight and it is found to be statistically significant.

Experimental investigation of shape transition effects on isolator performance
(2015) *International Journal of Turbo and Jet Engines*, 2015, pp. 331-338. Cited 1 time.

DOI: 10.1515/tjj-2015-0022

Abstract
Isolator is a critical component in supersonic air breathing engine and it is usually situated between the inlet and the combustor of a dual-mode ramjet/scramjet engine. In the present study, shape transition effects on isolator performance have been studied by carrying out experimental investigations on square, square to circular and square to elliptical transition ducts. The length of the isolator chosen in this study is 180 mm and the cross-sectional area of 900 mm2 is maintained constant along the length for all the ducts. Experiments were carried out for isolator inlet Mach 2, using a contoured nozzle. Varying the pressure of the settling chamber varied the expansion level at the nozzle exit, which run the nozzle. The wall static pressure along the length of the isolator and the Pitot pressure at the exit plane of the isolator were measured for all the configurations. Shadowgraph technique was employed for visualizing the shock-train in the isolator. The square to circular transition isolator is found to be more efficient in achieving the static pressure rise across the isolator than the square and square to elliptical transition ducts. © 2015, Walter de Gruyter GmbH. Abstract
Gear box is the most commonly used mechanical element in various kinds of machines which should be strong enough to withstand the sudden variations in load. Hence there is a need for designing an optimum gearbox for efficient performance. This research focuses on the multi objective design of gear pairs and gearboxes using evolutionary computation. The gear pair and gearbox design problems considered in this paper have two different parameters as objective functions. Since all the parameters are on different scales, these factors are normalised to the same scale. The normalised objective function is obtained and it is called as Combined Objective Function (COF), the design optimisation of spur gear pair, three speed gearbox design is planned to be optimised by using COF. The objective functions and constraints considered in this work are given. The objective functions consid ered in the present study are: minimisation of weight and minimisation of centre distance. The constraints considered are: (a) The induced bending stress obtained from the formula based on bending strength should be lesser than or equal to the allowable bending stress, (b) The induced crushing stress obtained from the formula based on contact compressive strength should be lesser than or equal to the allowable crushing stress, (c) The centre distance should be greater than or equal to the value obtained from the formula based on contact compressive strength, and (d) The module should be greater than or equal to the value obtained from the formula based on bending strength.

Parametric study of double point cutting tool on chip-tool interface temperature during turning of Aluminum Bar
(2015) *International Journal of Applied Engineering Research*, 10 (20), pp. 41681-41684.

[a] Department of Mechanical Engineering, Bharath Institute of Higher Education and Research, Chennai, 600 073, India
[b] Department of Mechanical Engineering, College of Engineering, Anna University, Chennai, 600 025, India

Abstract
Usually we use single point cutting tool for turning a workpiece to reduce the diameter say from 50 mm to 40 mm for the length of 200 mm. We have to go for at least 4 passes to finish the workpiece. By using a newly designed tool, i. e., double point cutting tool we can turn the same workpiece in 2 passes. So the Half of the machining time is reduced. Time is money. Hence Money is saved for machining. The double point cutting tool has two cutting points which has the height difference of 0. 5 mm and the distance between them is 6 mm. So that when the first cutting point takes 0. 5 mm depth of cut and next to that the second cutting point also takes 0. 5 mm depth of cut as the tool proceeds for turning. Chip-Tool Interface Temperature takes very important role in metal cutting which decides the dimensional accuracy, mechanical properties of the workpiece and the tool life. Experimental study is made on Chip-Tool Interface temperature by using double point cutting tool during turning of Aluminum Bar for different speed and feed is presented and discussed in this Research article. © Research India Publications.

Abstract
Ashokarishtam is a proven Ayurvedic medicine for the treatment of disorders of female reproductive system, particulary, menorrhagia, metrorrhagia and amenorrhea. In order to understand the various biomolecules present in this medicine, GC MS analaysis was performed. It was found that some very important biomolecules like 2, 3- Butanediol, [R-(R*, R*)], Phenol, 2,4-bis(1,1-dimethylethyl)- derivatives, n- Hexadecanoic acid, 2-Amino-1,3- propanediol or Thiophene, Furyl hydroxymethyl ketone, Dihydroxyacetone, 2-Furanmethanol, 2, 5- Dimethyl-4- hydroxy-3(2H)-furanone were found which have some very effective medicinal roles. It is of interest to find that there is no biological activity reports available for some of the major components found in the GC MS study like1- Propanol, Oxalic acid, cyclobutyl heptyl ester, Propanoic acid, 2-oxo-, methyl ester, 1,3-Butadiene-1-carboxylic acid, 1, 2-Cyclopentanedione, 2,4-Dihydroxy-2,5-dimethyl-3(2H)-furan-3-one, Hexadecanoic acid, 2-hydroxy-1- (hydroxymethyl)ethyl ester, Hexanoic acid, 2-ethyl-anhydride, 1-Isobutyl-7,7-dimethyl-octahydro-isobenzofuran-3aol, Ethyl 2-nitropropionate. Further investigations are warranted to identify the biological functions of these components to get some clues as to the medicinal role of Ashokarishtam.

Author Keywords
1-Propanol; Amenorrhea; Ashokarishtam; GC MS; Hexadecanoic acid; Metrorrhagia

Index Keywords
1 isobutyl 7,7 dimethyl octahydro isobenzofuran 3a ol, 1,2 cyclopentanedione, 1,3 butadiene 1 carboxylic acid, 2 amino 1,3 propanediol, 2 ethyl anhydride, 2 hydroxy 1 (hydroxymethyl)ethyl ester, 2 oxomethyl ester, 2,3 butanediol, 2,4 bis(1,1 dimethylethyl) derivative, 2,4 dihydroxy 2,5 dimethyl 3(2h) furan 3 one, 2,5 dimethyl 4 hydroxy 3(2h) furanone, ashokarishtam, ayurvedic drug, cyclobutyl heptyl ester, dihydroxyacetone, ethyl 2 nitropropionate, furfuryl alcohol, furyl hydroxymethyl ketone, hexanoic acid, n hexadecanoic acid, oxalic acid, palmitic acid, phenol, plant medicinal product, propanol, propionic acid, thiophene, unclassified drug; antiinflammatory activity, antioxidant activity, Article, Ayurveda, biological activity, chemical composition, human, mass fragmentography, medicinal plant, menstruation disorder, nonhuman, phytochemistry

Chemicals/CAS
2,3 butanediol, 513-85-9; dihydroxyacetone, 67255-48-5, 96-26-4; furfuryl alcohol, 98-00-0; hexanoic acid, 142-62-1, 151-33-7; oxalic acid, 144-62-7; palmitic acid, 57-10-3; phenol, 108-95-2, 3229-70-7; propanol, 62309-51-7, 71-23-8; propionic acid, 72-03-7, 79-09-4; thiophene, 110-02-1

Study on the intravascular catheter-related bloodstream infections in a tertiary care hospital of Tamil Nadu, India
(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (6), pp. 287-291. Cited 1 time.

[a] Department of Microbiology, Sree Balaji Medical College and Hospital, Chromepet, Chennai, Tamil Nadu, India
[b] AU-KBC Research Centre, MIT Campus of Anna University, Chennai, India

Abstract
The catheter related blood stream infections (CRBSI) are identified as a threat of human kind worldwide affecting ICU admitted patients in hospitals. The rate of chances of getting the CRBSIs vary depending on the hospital set ups and several other variables. The aim of this study is to evaluate the percentage of bacterial colonisation and catheter related blood stream infections (CRBSI) together with the antibiotic susceptibility patterns in a tertiary care hospital located in Chennai, Tamilnadu. Of the 68 catheters studied out of 55 patients, the incidence of colonisation was found 37.6% and CRBSI was 14%. The pathogens identified from the cultures include S.aureus, Pneumonia sp. Klebisiella etc. Among this Staphylococcus aureus was found to be the major contributor of CRBSI with 25% rate of. With respect to antibacterial resistance 100% of Enterobacteriacae were ESBL producer, 49.0% Pseudomonas sp. were imipenem resistant, 65% Staphylococcus aureus were resistant to methicillin resistant. The major risk factors include age of patient, immune status and number of catheters in situ etc. The result of this study would be useful for control and treatment of CRBSI.

Abstract
Shells, stressed skin structures because of their geometry and small flexural rigidity of the skin, tend to carry loads primarily by direct stresses acting in their plane. Concrete shallow funicular shells of rectangular ground plan, double curvature with different rises are loaded to failure with a concentrated central force. Specimens of size 100 cm x 100 cm in plan with edge beam of size 4 cm x 4 cm are prepared with concrete of grade M30 for which the mix design is carried by Indian Standard method. The specimens are prepared with various rises and moist cured. They are subjected to ultimate loads and the corresponding strains and deflections are measured. Failure patterns for shells with different rises are observed. From the experimental investigations, a relation between span to rise ratio and ultimate load is arrived. It is concluded that the ultimate loads are function of the rise of the shell. © Research India Publications.

A heuristics based adaptive audio watermarking scheme through SVD-KFDA

(2015) *International Journal of Systems Signal Control and Engineering Application*, 8 (1), pp. 11-18.

DOI: 10.3923/ijssceapp.2015.11.18

[a] Department of CSE, Bharath University, Chennai, India
[b] Department of CSE, VBIT, Hyderabad, India

Abstract
The heuristics based adaptive audio watermarking technique using SVD-KFDA is proposed in this study. The audio signal is segmented by sub-frames and synchronization code embedded with watermarked signal. On other side, the down-sampling and modulation process using energy relationship is anticipated in order ensure reliable and robust fidelity on watermarked signal. The heuristics process identifies the native energy relationship among sub-frames which is hidden in the watermarked signal through SVD-KFDA. The heuristics based adaptive model is more resilient and can propose extraordinary robustness on usual acoustic data processing and outbreaks associated with common watermarking methods. This system exposes feasibility on implementation and derives less evaluation complexity. © Medwell Journals, 2015.

Quality of sleep in patients with bipolar i disorder during remission
(2015) *Journal of Psychiatric Practice*, 21 (6), pp. 419-426. Cited 6 times.

DOI: 10.1097/PRA.0000000000000116

Abstract
Background and Goals: Sleep disturbances have been noted not only during affective episodes in bipolar disorder, but also between affective episodes. The goal of this study was to assess and identify determinants of sleep quality in patients with bipolar I disorder. Methods: This cross-sectional study enrolled patients with bipolar disorder who were currently in remission. Sleep quality was assessed using the Pittsburgh Sleep Quality Index (PSQI). Mood symptoms were evaluated using the Young Mania Rating Scale (YMRS) and the Hamilton Depression Rating Scale (Ham-D). Adherence was assessed using the Medication Adherence Rating Scale. Results: The mean age in the sample (N=103) was 37.4 years; 44.7% of the sample were men. On the basis of PSQI scores, 41 patients (39.8%) were poor sleepers. Poor sleepers had significantly higher Ham-D scores (mean score of 1.8 vs. 0.9, P=0.012) and higher rates of medication nonadherence (36.6% vs. 11.3%, P=0.002). The relationship between Ham-D scores and sleep quality did not remain significant when the sleep-related items on the Ham-D were removed. Logistic regression analysis suggested that medication nonadherence was the only independent predictor of poor sleep quality in this study. Conclusions: A significant proportion of patients with bipolar disorder who are in remission have sleep problems that seem to be independent of core symptoms of depression. © 2015 Wolters Kluwer Health, Inc. Abstract
The actions of nicotine upon cerebellar function are poorly understood. Small doses of nicotine have a stimulating action on the central nervous system whereas large doses depress. 16 adult male albino rats of wistar strain weighing 135-150 grams were used for the present study. The rats were divided in to four groups each consists of 4 animals. The control group was given 0.9% saline as vehicle and the experimental groups (drug treated- II, III, IV) were given intraperitoneal injection of Nicotine a dose of 0.5 mg/kg, 0.75 mg/kg and 1mg/kg body weight dissolved 1:1 ratio in normal saline respectively for a period of 28 days. Cortical layers were intact in the entire drug treated group. White matter with few vacuoles was observed in 0.5 mg/kg Nicotine induced group. Disruption of Purkinje cell layer and granular cells was observed in 0.75 mg/kg induced group. Dose of 1mg/kg nicotine induced group animals shown complete disruption of Purkinje cell layer, cellular disruption in granular cell layer. Extended core of white matter into the folia of the cerebellum cellular microcystic change with interstitial oedema was observed in the same group. The loss of white core, Purkinje cell layer, and granular layer cellular disruption give better knowledge in understanding long term nicotine exposure. Our study reveals the histopathological changes of nicotine on long term administration in adolescent rat cerebellum with their clinical significance. © Copyright protected.

Abstract
Nowadays due to exceptional scale and vibrant nature of the internet, popular web services will often run on web clusters in order to guarantee the availability and scalability of the web services. To share the service traffic among cluster servers transparently to the clients the servers will depend on load balancing techniques. In this paper, content-blind and content-aware web switches to assign the requests of clients is considered. In particular, we will consider request dispatching algorithms which uses either only client information or client and server information for load balancing. © Research India Publications.

Abstract
An experimental investigation was carried for measuring heat transfer, Reynolds number, and friction factor fitted in concentric tube with twisted tape inserts. The different twist ratio y=2.52, 3.00 and 3.20 were studied for the laminar flow using computational fluid dynamics package. An aluminium inner tube of 18 mm internal diameter and 20mm outer diameter and 220mm length was used for experimental study. The outer tube material is mild steel of 28mm inner diameter and 32mm outer diameter was used for the experimental record. A copper twisted tape of different twist ratio of twist was inserted and the obtained plain tube data were verified with twisted tape inserts and ensure the validation of simulation results. The results are analyzed that the twisted tape accessible high heat transfer with increases in friction factor. In additionally the experimental value of twisted tape as compared with numerical simulation. A CFD package of commercial Ansys Fluent were utilized for simulate the twisted tape.

Abstract
This paper presents modeling of Photovoltaic module using MATLAB Simulink toolbox. Single diode equivalent circuit of a PV cell is used to study the I-V and P-V characteristics. The proposed model is developed for a typical 250W PV module. The key benefit of this study can be done for any PV module configuration. © Research India Publications.

Fuzzy based modeling of cascaded multilevel inverter

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 6820-6824.

[a] Department of EEE, Bharath University, India
[b] Department of EEE, Tagore Engineering College, India

Abstract
Multilevel pulse width modulation (PWM) inverters have been developed to overcome shortcomings in solid state switching device ratings so that large motors can be controlled by highpower adjustable frequency drives. This paper investigates the variation in the harmonic spectrum of cascaded multilevel inverters with different voltage levels. To make the analysis efficient, fuzzy based control scheme is employed. © Research India Publications.

A study on the women empowerment through self help group (SHG) and bank linkage model
(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 7514-7519.

[a] Department of Management Studies, Tagore Engineering College, Chennai, 127, India
[b] Bharath University, Chennai, 73, India

Abstract
Micro finance is a type of banking service that is provided to unemployed or lowincome individuals or groups who would otherwise have no other means of gaining financial services. Ultimately, the goal of microfinance is to give low income people an opportunity to become selfsufficient by providing a means of saving money, borrowing money and insurance. In recent years Microfinance has attracted widespread attention for its developmental Impact for the poor. The aim of the project is to study the level of women empowerment through SHG & Bank linkage model. The study is conducted with reference to Indian Overseas Bank, T.Nagar Branch, Chennai. The main objective of the study is to know the women empowerment in all aspects of their life through micro finance. Descriptive type of research design has been adopted for the study. Census survey is conducted with members of the self help group IOB, T.Nagar Branch, Chennai. The data are collected from the survey conducted among SHG women the women (primary data). The data thus collected are interpreted through various techniques. Statistical tools used for the study are Chi-Square, Average, One way ANOVA and Z Test.Based on the analysis findings suggestions and conclusions are made. © Research India Publications.

Smart stimuli material for hybrid ornithopters with alternative power source

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 5184-5187.

[a] Dept. of Aeronautical Engineering, Bharath university, Chennai, India
[b] Department of Aeronautical Engineering, TagoreEngineering College, Chennai, India

Abstract
MAVs are tiny vehicles which can be flown from aremote location and used for various reconnaissance and detection applications. MAV Flappers are those which are of lightweight with fewer payloads, flapping wings and supported by a slender body. The flapping wings which resemble those of birds are the lift producing surfaces. But it is obvious that the energy needed for flapping is more when compared to that of fixed winged MAVs. And moreover the long-range flight has been unsuccessful with flappers. Hence the paper deals with the alternative source of energy that is using of thermals for the soaring of MAVs. The body of the MAV should be very sleek and slender. Further it should be light in weight as well. It should have the tendency to sense the thermals and should not undergo any material fatigue. One such material which satisfies the above criteria is Smart material. A special type of smart materials, responsive polymer materials, are able to transmit the stimuli signals to each other that comes from the surrounding environments such as thermal, electrical and other kinds of signals. Hence the thermal stimuli responsive polymer smart materials can respond efficiently to the surrounding thermals. The above mentioned thermo-responsive material suits the MAV flapper, which uses thermals for soaring, in which the flapping wings are to be responsive to the incident thermal air currents on the MAV from the environment. Further, the stabilizers at the rear side of the MAV maintain the stability and hence are to be strong and weightless for efficient flight. This can be achieved by the use of composite materials. They possess a very high strength to weight ratio as well as stiffness to weight ratio. © Research India Publications.

Abstract
Permanent Magnet Brushless motor DC (PMBLDC) motor is rapidly gaining popularity and are widely used in industries such as aerospace, consumer, medical, industries, automation equipment and instrumentation because of their important characteristic like high power density, Torque-inertia ratio, small size, higher efficiency. One main problem in the PMBLDC motor is the torque ripple which causes undesirable acoustic noise and vibration which effect the overall performance of the machine. The proposed work aims at analysing the harmonics using FFT analysis. © Research India Publications.

Passive control for prevention of flow separation in axial flow compressors
(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 5163-5168.

[a] Department of Aeronautical Engineering, Sathyabama University, Chennai, India
[b] Bharath University, Chennai, India
[c] Department of Aeronautical Engineering, Tagore Engineering College, Chennai, India

Abstract
Flow separation is the most common problem in the area of Aerospace Industry. The flow separation in the wings leads to loss of lift. There are many techniques involved to prevent the flow separation. In the case of jet engines the axial flow compressor are prone to flow separation. The efficiency of Brayton Cycle is function of pressure ratio (Jet Engine works on Brayton Cycle). Due to flow separation and pressure loss associated with it renders engine for limited applications. To have high pressure in such cases more numbers of stages are required hence makes system bulky and heavy. More numbers of stages also enhances the chances of flow separation. This flow separation can be prevented by active and passive methods. It is proposed to inject a secondary jet flow on the blade airfoil (2-D), which re-energizes the flow. This method can be treated as passive control since no external agency is used to activate the flow. Normal cambered blade profile of a compressor with different secondary injection will be analysed for optimum jet injection velocity and angle to prevent flow separation (stall) using Ansys, Fluent. © Research India Publications.

Experimental investigation on the metal matrix composite of aluminium alloy with Al2o3
(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 7643-7647.

[a] Department of Mechanical Engineering, Tagore Engineering College, Chennai, 127, India
[b] Department of Mechanical Engineering, Bharath University, Chennai, 73, India

Abstract
The purpose of the project is to show and compare of modern method composite materials with aluminium alloy matrix reinforced by Al2O3 particles manufacturing. Using this project work it is possible to fabricate products with different geometries like solid and hollow profiles, with a fixed or varying transverse section. The received results show the possibility of obtaining the new composite materials with required structure joining positive properties of composite materials component. This project work of aluminium alloy composite materials reinforced by ceramic particles manufacturing ensures required structure and can be applied in practice. The results indicate that Al2O3 particles can be used as the hard dispersed phase in aluminium for wear-resistant and abrasion-resistant applications. © Research India Publications.

Numerical analysis of drilling characteristics in Gfrp composite using grey relational algorithm
(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 5340-5347. Cited 1 time.

[a] Department of Aeronautical Engineering, Tagore Engineering College, India
[b] Department of Aeronautical Engineering, Bharath University, India

Abstract
The Glass Fibre Reinforced Plastic (GFRP) composites are widely used for a several applications in automotive, aerospace and chemical industries due to their superior properties. This composite material needs the drilling operation for their final assembly. The drilling of GRFP laminates imposes a great challenge due to its non homogeneous and anisotropy nature. Debonding, delamination, fibre pullout and hole shrinkage may occur during the drilling of these GFRP composites. Proper selections of drill tool and process parameters are very important in drilling of these composite materials to minimize these defects. The drilling experiments were carried out at full factorial design for this glass/polyester composite using Helical flute straight shank drill and “Brad and Spur” drill by varying the drilling process parameters such as cutting speed and feed. The aim of this paper is to present the application of Grey relational Algorithm to evaluate the drilling characteristics of glass/polyester composite. The effects of drilling process parameter such as cutting speed and feed rate on specific cutting pressure, power, delamination factors were investigated to get the optimum drilling process parameters. The Analysis of variance (ANOVA) and Grey Relation Algorithm were used to get multiple objective optimizations to get damage less drilling of glass/polyester composites. The results demonstrate that the feed rate is the major parameter than other controllable factor that influences the delamination. At the end, the optimal combinations of the drilling process parameters are determined. © Research India Publications.

Abstract
In this paper, the space vector modulation technique for an ordinary two level inverter is described. Based on the two level inverter, the paper further deals with space vector pwm technique for a three level inverter. A new algorithm is adopted which ensures reduced computational complexity and the same methodology can be used with higher levels as well. Further a performance comparison of both two and three level inverter is done and this proves superiority of multilevel inverters over an ordinary inverter. © Research India Publications.

[c] Department of Mechanical Engineering, Bharath University, Chennai, 73, India

Abstract
Potential improvement on exhaust emissions, biodegradability and the possibility to reduce dependence on fossil fuel resources has led to an increasing interest on the use of alternative fuels for transport application. In diesel engine spray characteristics play a vital role in improving the combustion and emission characteristics of fuel because it directly affects the air-fuel mixture formation. Spray characteristics of the fuel depends on density and viscosity of fuel, injection pressure, injection timing, injection duration, ambient pressure and temperature of fuel. In this study investigate the spray characteristics for diesel by changing the injection timing such as conventional timing (23° bTDC), retard injection timing (20° bTDC) and advance injection timing (28° bTDC). For visualizing spray characteristics of combustion chamber the Mie-Scattering technique is followed and in diesel engine there are two holes on the cylinder walls one hole is for LED light source is placed to visualize the spray inside the cylinder combustion chamber. Another one hole is for fastec high speed video camera is fixed to capture the spray structure. Then the image is captured and taken for analysis. The record images are analysed by PRO-ANALYST software with incorporating the computer. © Research India Publications.

Z-source buck-boost matrix converter using safe commutation strategy
(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 6879-6886.

[a] Department of Electrical and Electronics Engineering, Tagore Engineering College, India
[b] Department of Electrical and Electronics Engineering, Bharath University, India

Abstract
This paper describes a type of converter that can buck and boost voltage with step-changed frequency called a Single-Phase Z-Source Buck- Boost Matrix Converter. It employs a safecommutation strategy which results in the elimination of voltage spikes on switches without the need of a snubber circuit. This is achieved through a novel switching control. The operating principles of this converter are described and the circuit behaviour is confirmed by MATLAB / Simulink simulation results. The Hardware Design for Single Phase Matrix Converter for R load is implemented. © Research India Publications.

Smart home voice controller

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 6895-6898.

[a] Department of Electrical and Electronics Engineering, Tagore Engineering College, India
[b] Department of Electrical and Electronics Engineering, Bharath University, India

Abstract
Now a days voice controllers are gaining importance because of improvements in speech recognition and huge processing power of processors. Voice controller is more beneficial and easy to use for elderly and other incapable home dwellers. Human voice is used to control various switches of few smart appliances. This project aims at developing a new domestic switching that can be controlled a trained by voice. The voice recognition system that consists of voice recognition chip HM2007, and the PIC18F8722 microcontroller forms the heart of the system. The HM2007 serves as voice observer (ear of the system) that will listen and interpret the command, while the PIC18F8722 serves as the brain of the system that will select the correct output for the given input command. © Research India Publications.

Numerical investigation of mixing characteristics of chevron nozzle by passive controls method
(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 5169-5179.

[a] Tagore Engineering College, Chennai, India
[b] Bharath University, Chennai, India
[c] Sathyabama University, Chennai, India

Abstract
The paper deals with the Reduction of noise in the Nozzle exhaust is done by attaching Chevrons with particular parameters in the Nozzle exhaust. Numerical investigations have been carried out on Chevron Nozzles to assess the importance of Chevron parameters such as the number of Chevrons and the mixing characteristics of jet. After assessing the Chevron parameters we modify the Chevron shapes at the exit by fixing the triangular wedge in order to get maximum noise reduction along with very negligible thrust loss. Finally compare the results of free jet Nozzle with Chevron and Chevron with wedge using ICEM CFD software and also compare the results of potential core decay of these Nozzles. © Research India Publications.

Author Keywords

Augmentation of lift by airfoil modification

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 5188-5192.

[a] Department of Aeronautical Engineering, Tagore Engineering College, Chennai, India
[b] Dept. of Aeronautical Engineering, Bharath university, India

Abstract
S.T.O.L. aircrafts have high L/D, at very low speeds, by using high t/c airfoils and because of this, they are limited to low velocities. The objective of the project is to vary the upper surface of a “laminar” airfoil with that of a “high lift” airfoil during takeoff to be quickly airborne and to change it back to the original one, once the velocity reaches the limiting velocity of the modified one. C.F.D. analysis has been done for different angles and three velocities. The shape change is expected to be brought about by some effective actuating mechanisms or by S.M.A.s. © Research India Publications.

Speed control of linear induction motor

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 6831-6838.

[a] Department of EEE, Tagore Engineering College, India
[b] Department of EEE, Bharath University, India

Abstract
Today's conventional solution of machine tool drive consists of a rotational motor and a mechanical converter which converts rotational motion into translational. Since the mechanical elements introduce backlash and elasticity in the system, better performance of the feed drive could be achieved by the linear motor with appropriate servo control. The input output linear zing control of a linear induction motor was therefore designed which, provides high performance and high disturbance rejection. This paper shows a design of linear induction motor using Magnet software and the speed is controlled by using PI and PID controller using Matlab platform. © Research India Publications.

Mechanical characterization of GLARE composites

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 5348-5353.

[a] Department of Aerospace Technology, Madras Institute of Technology, India
[b] Department of Aerospace Technology Bharath University, India

Abstract
Fiber metal laminates are hybrid composite materials built-up from interlacing layers of thin metals and fiber reinforced adhesives. The most commercially available fiber metal is Glare(Glass Reinforced Aluminium Laminate).Any load on Glare laminated composites may encounter major damages like fiber metal delamination and fiber metal debonding and fiber failure etc. So it is essential to study the fiber metal debonding and improve the bonding between the fiber and metal. To investigate the effect of surface roughness of the Aluminium sheet, the Aluminium sheets were sandblasted at three different pressure levels(40psi, 60psi, 80psi to produce surface roughness). By using Tinius olsen 100KU universal testing machine the specimens were subjected to flexural and tensile testing with acoustic emission monitoring. From the test it is observed that the bonding between the Aluminium and fiber is high in the laminate having the aluminium of sandblasted pressure of 60 psi. From the acoustic monitoring results, the nature and extent of damage has been observed. Further Aluminium powder is added as a filler material to improve the bonding between fiber and metal,this laminate is impacted at a velocity of 2.5m/s. © Research India Publications.

Data compression soft error rate mitigation in FPGA

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 6887-6894.

[a] Department of Electrical and Electronics Engineering, Tagore Engineering College, India
[b] Department of Electrical and Electronics Engineering, Bharath University, India

Abstract
A built in Hamming Code has been introduced to provide a reliable operation of SRAM based FPGA systems in the remote applications such as space research. Radiation induced soft errors degrades the reliability of the Field Programmable Gate Arrays. Our proposed built in Hamming Code feature leads to improvement of system availability in-case of occurrence of faults. Without depending on an external memory our proposed system can recover the configuration bits. To enrich the efficiency of our design we propose an SRAM buffer. In additional this paper proposes a novel test data compression technique.It proposes a test compression technique using efficient dictionary and bitmask selection to significantly reduce the testing time and memory requirements. With our built in hamming code technique the SRAM based FPGA can be 99.99% with data bit of 7 error in 1 billion h. Our test compression algorithm outperforms existing dictionary- based approaches by up to 30%, giving a best possible test compression of 92%. © Research India Publications.

Ramjet with steam fuel system

(2015) *International Journal of Applied Engineering Research*, 9 (22), pp. 5180-5183.

[a] Aeronautical Dept, Tagore Engineering College, Chennai, India
[b] Dept. of Aeronautical Engineering, Bharath university, Chennai, India

Abstract
Fuel consumption is more and major drawback in Ramjet. To minimize this problem different techniques can be adopted. Paper deals with one such technique viz. Steam fuel system. To increase density of fuel this system has greater influence to decrease the fuel consumption at the same time thrust can be enhanced up to a large extend. Paper deals with comparison of fuel consumed in a simple Ramjet and Ramjet with steam fuel system. The experiments are carried out in a simple Ramjet and the corresponding pressure, temperature, velocity reading will be taken to calculate thrust. Similarly the experiments were conducted in Ramjet with steam fuel system and corresponding readings of pressure, temperature, velocity reading will be taken to calculate thrust. The result is expected to be increase in temperature and thr ust compare to be simple ramjet. © Research India Publications.

Regression testing using AIGRTP algorithm for industries
(2015) *International Journal of Applied Engineering Research*, 10 (18), pp. 39822-39827.

[a] Bharath University, Department of Computer Science, Women's Christian College, Chennai, India
[b] Department of Computer Science, Govt. Arts College, Nandanam, Chennai, India

Abstract
In a software industry during the software production phase the software maintenance activity is an expansive phase which cost nearly sixty percentage of total cost. Regression testing is an important phase in software maintenance activity to ensure the modification caused by debugging. Regression testing is a testing to test the modified software during the maintenance level. Regression testing is a costly but crucial problem in software development. Both the research community and the industry have paid much attention to this problem. This paper try to do the survey of and current practice in industry and also try to find out whether there are gaps between them. The observations show that although some issues are concerned both by the research community and the industry. The goal of our research is to improve the control of the testing and reduce the amount of redundant testing in the product line context by applying regression test selection strategies. The proposed Advanced Industry oriented genetic algorithm for regression test case prioritization (AIGRTP) is compared with previous approach using APFD metric. The results represent that propose approach outperforms the earlier approach. © Research India Publications.

Abstract
Wireless physiological monitoring system (WPMS) and wireless wearable physiological monitoring system are widely used for the purpose of quick and remotely diagnosing method. From the last decade the usage of telemedicine system is moderately increasing to reduce the physician requirement in the field of diagnosis. The currently available diagnostic methods are very expensive and rarely available in developing countries. The present experiment we have developed to reduce the cost of the patient monitoring system and user friendly version of WPMS. and develop affordable low-cost wireless physiological monitoring system for patient diagnosis. © 2015, International Journal of Pharmacy and Technology. Autism spectrum disorder
(2015) *International Journal of Pharmacy and Technology*, 7 (2), pp. 8638-8647. Cited 1 time.

[a] Bharath University, Chennai, 600 073, India
[b] PSNA College of Engineering and Technology, Dindugal, 624622, India

Abstract
Autism is a lifelong developmental condition that affects, among other things, the way an individual relates to his or her environment and their interaction with other people. The main areas of difficulty are in social communication, social interaction and restricted or repetitive behaviours and interests. An estimated one in 100 people has autism; that's almost 230,000 Australians. Autism affects almost four times as many boys than girls. A kid's symptoms could be very mild, severe, or somewhere in the middle. For example, some kids might be upset by too many noises or sounds that are too loud. This is serious disorder which requires treatment with brain wave and signals. Brain imaging studies have shown that abnormal brain development beginning in an infant's first months may have a role in ASD. At this time, the only medications approved by the FDA to treat aspects of ASD are the antipsychotics risperidone (Risperdal) and aripripazole.Because of these developments, Autism Research is expanding its scope to include adequately powered treatment studies, with a particular emphasis on research that reveals underlying mechanisms, either by testing causal hypotheses or by revealing variations in responses, which prompts refinement of explanatory models. © 2015, International Journal Of Pharmacy and Technology. Abstract
Most of the members of the therapeutic team in stroke rehabilitation use physiotherapy as an effective treatment for stroke. Hence it does imply that stroke patients benefit from rehabilitation with physiotherapy. This benefit may be small, but for a given individual, chance of relief from the stroke is high. The evidences are available today about effect of physiotherapy in treating stroke using which the normal life of the stroke's patience is brought back. Even though many treatments exist for stroke, Physiotherapy is the most effective one. Like other treatments it does not need any clinical trials. Since we are in need of selecting therapies that are most cost-effective and also to be given to the largest number of patients this physiotherapy satisfies both the needs. © 2015, International Journal Of Pharmacy and Technology. Abstract
Magneto hydro dynamics power generation is a non-conventional energy resource used in modern systems. Due to high demand of coal, it is necessary to search for other alternative heat source to drive the magneto hydrodynamics power plants. The liquid metal like alumi-num, manganese, copper and silver can be employed due their improved thermal conductivity and flow characteristics. The magneto hydro dynamics power generation process needs high temperature heat source for converting the inert gas into ionized plasma. A regenerative heat exchanger is employed for heat transfer between melted metal from source chamber to argon gas chamber. The heat transfer coefficient between the liquid metal flow and inert gas is high according to flow conducting material. This work deals with the inert gas plasma which is produced from liquid aluminium and this can be used for recycling. This system proves only 36% of aluminum is required than that of regular MHD system using coal as a heating source.

Abstract
Background: The actions of nicotine upon cerebellar function are poorly understood. Small doses of nicotine have a stimulating action on the central nervous system whereas large doses depress. Materials and Methods: 12 adult male albino rats of wistar strain weighing 135-150 grams were used for the present study. The rats were divided in to four groups each consists of 4 animals. The control group was given 0.9% saline as vehicle and the experimental groups (drug treated- II, III, IV) were given intraperitoneal injection of Nicotine a dose of 0.5 mg/kg,0.75 mg/kg and 1mg/kg body weight dissolved 1:1 ratio in normal saline respectively for a period of 28 days. Results: Cortical layers were intact in the entire drug treated group. White matter with few vacuoles was observed in 0.5 mg/kg Nicotine induced group. Disruption of Purkinje cell layer and granular cells was observed in 0.75 mg/kg induced group. Dose of 1mg/kg nicotine induced group animals shown complete disruption of Purkinje cell layer, cellular disruption in granular cell layer. Extended core of white matter into the folia of the cerebellum cellular microcystic change with interstitial oedema was observed in the same group. Conclusion: The loss of white core, Purkinje cell layer, and granular layer cellular disruption give better knowledge in understanding long term nicotine exposure. Our study reveals the histopathological changes of nicotine on long term administration in adolescent rat cerebellum with their clinical significance. © 2015, International Journal Of Pharmacy and Technology. Characterization and properties evaluation of conducting Al-doped ZnO at low temperature by ECD method

(2015) *Oriental Journal of Chemistry*, 31 (2), pp. 1035-1042. Cited 1 time.

DOI: 10.13005/ojc/310252

[b] Department of Bio-medical Engineering, Bharath University, Chennai, Tamilnadu, India

Abstract
Low temperature (70°C) deposition of Al-doped ZnO films are successfully reported by simple electrochemical deposition technique. Simple three electrode setup is used with chemical bath containing different molar ratios of Zinc nitrate and Aluminium nitrate (9:1, 8:2, 7:3 and 6:4), a constant potential of -1.3 V is employed between electrodes for deposition of films. '2,' and'd' spacing variations obtained from XRD with varied Al content proves doping of Al into crystal structure of ZnO. Al content from Elemental analysis (EDAX) is in accordance with the compositions used. Morphology of films is characterized by FE-SEM, where flake-like structures are observed. Variation of Electrical resistivity with varying Al content in the films supports the argument of doping. Lowest resistivity is observed for composition 7:3 i.e. 2.25×10-4 &! cm. Optical characterization is done on the film powder for measuring band gap and transmittance, which showed 90% of transmittance and Band gap widening is observed for different compositions, due to incorporation of Al into crystal structure of ZnO.

Advanced V2V & V2I based system for preventing & notification of accident with severity estimation
(2015) *International Journal of Applied Engineering Research*, 10 (20), pp. 16587-16590.

[a] Dept. of Electronics and Telecommunication, BIST (Bharath Institute of Science and Technology), Selaiyur, Chennai, India
[b] Dept. of Electronics and Communication, Sathyabama University, Chennai, India

Abstract
In traffic accidents the injured people can be assisted efficiently on time by the modern information technologies like GSM, GPS. The communication technologies should support to emergency service center to take a quick decision automatically based on the information they received from the vehicle, so that we can estimate the severity of an accident and can reduce the service time to the peoples who injured by an accident. In proposed system the accident can be notified automatically using sensors and the location & severity of accident also send as SMS via GSM to the corresponding rescue centre. We consider relevant variables (such as Speed sensor Body Control Module) that can characterize the severity of accident. © Research India Publications.

An efficient VLSI architecture for an IIR filter using Multi-Bit Flip-Flops
(2015) *International Journal of Applied Engineering Research*, 10 (55), pp. 648-652.

[a] Department of ECE, Kalasalingam Institute of Technology, Anna University, Krishnankoil, India
[b] Department of ECE, Bharath University, Selaiyur, Chennai, India

Abstract
Recent advances in mobile computing and multimedia applications demand high-performance and low power VLSI Digital Signal Processing (DSP) systems. In this paper, a design methodology to implement low-power and high-speed 2nd order recursive digital Infinite Impulse Response (IIR) filter has been proposed. Since IIR filters suffer from a large number of constant multiplications, the proposed method replaces the constant multiplications by using addition/subtraction and shift operations. The proposed new 6T adder cell is used as the Carry-Save Adder (CSA) to implement addition/subtraction operations in the design of recursive section IIR filter to reduce the propagation delay.Utilizing multi-bit flip-flops (MBFFs) is one of the most effective power optimization techniques in modern nanometer integrated circuit design.One way to improve the flip-flop's performance is to merge the clock pulse given to multiple flip-flops, so that we can reduce its power consumption. Multi-bit flip-flops are designed by single clock pulse thereby maintaining the same functionality as that of two single-bit flip-flop. Hence in the proposed work, the MBFFs are used as a delay element. It is observed from the experimental results that the proposed 6T adder and MBFF based design method can find better IIR filter designs in terms of power and delay. © Research India Publications.

A NOR type, SMLSS for high speed and energy efficient CAM cell

(2015) *International Journal of Applied Engineering Research*, 10 (55), pp. 653-657.

[a] Department of ECE, Kalasalingam Institute of Technology, Anna University, Krishnankoil, India
[b] Department of ECE, Bharath University, Selaiyur, Chennai, India

Abstract
Content Addressable Memory(CAM) is widely used in the network routers for performing high speed data searching operation. A NOR type CAM offers high speed search operation in a single clock cycle. Normally NOR type CAM cell is power hungry than the NAND type CAM. So we try to introduce the energy efficient structure for the NOR type CAM using Small Match Line Sensing Scheme(SMLSS). Matchlines(MLs) are precharged to an intermediate level by pulsed current source to minimize the power. In this technique, SMLSS can reduce the power consumption 5 times compared with the conventional one. In addition Multi Vttransistors are used in every cam cell for reducing the leakage current during missmatch period. This Multi Vt transistor concept reduces the leakage current by 15×than the normal Vt transistor. © Research India Publications.

Histopathological changes in cerebellum on administration of Kainic acid in experimental models
(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (5), pp. 423-427.

Abstract
Kainic acid induced neuronal excitation and selective vulnerability in the hippocampal neurons are related to the distribution and selective susceptibility of the AMPA/kainate receptors in the brain. Recently, the neuro-physiological studies also suggested that the cerebellum also could participate in excitotoxicity. A total of 12 adult male albino rats of wistar strain weighing 135-150 grams were used for the present study. The rats were divided in to four groups each consists of 4 animals. The control group was given 0.9% saline as vehicle and the experimental groups (drug treated-II, III, IV) were given an intra peritoneal injection dose of 0.5 mg/kg, 0.75 mg /kg and 1mg/kg body weight respectively for a period of 28 days. Purkinje cell loss was not much in number and granular cells were normal in 0.5 mg/kg KA induced group. There was a loss of Purkinje cell layer (very few cells) and cells were in degenerative stage stained lightly. We were also observed all the other layers and white matter of the cerebellum in 0.75 mg/kg induced group. Dose of 1mg/kg Kainic acid induced group animals shown significant loss of Purkinje cells and disruption of cellular layers and granular cells. There were vacuoles in white matter when compared to other drug treated groups was found in the same group. Previous literatures stated that mechanisms underlying the pathogenesis of kainic acid induced cerebellar excitotoxicity remain unknown. The present study gives histopathological knowledge of neuronal cell death in cerebellum at different doses on long term administration of kainic acid but cellular mechanisms need to be evaluated.

The relative position of greater palatine foramen in dried human adult unsexed skull bones
(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (5), pp. 869-876.

[a] Sree Balaji Dental College and Hospital, Bharath University, Chennai, Tamil Nadu, India
[b] Sree Balaji Medical College and Hospital, Bharath University, Chennai, Tamil Nadu, India
[c] Sree Venkateshwara Dental College and Hospital, The Tamilnadu Dr.MGR Medical University, Chennai, Tamil Nadu, India

Abstract
The relative position of the greater palatine foramen (GPF) was evaluated for precise injection of local anesthetics for optimal pain control in maxillofacial and dental surgeries. The study was conducted in 132 adult dried unsexed skulls which were normal with fully erupted third molars and free from any pathological changes. Unambiguous and well-defined points were taken and the observations were made. All the distances were measured with vernier caliper to the nearest millimeter The statistical analysis indicated there was no significant difference in the measurement between the right and left sides with regard to the distance of GPF to the midline, GPF to the incisive fossa, GPF to the posterior border of the hard palate. The angle made by the line joining the GPF to the incisive foramen with the palatal midline (GIM angle) on two sides showed statistical significance. The mean angle on the left side was 21.2 +/- 4.2 degrees and 20.1 +/- 4.2 degrees on the right side. In 74.6 percent of skulls, the GPF was located opposite the third maxillary molars, whereas 24.2 percent showed the GPF between the second and third molars. In 0.4 percent of skulls, the GPF was opposite to the second molar and in 0.8 percent of skulls; the GPF was situated beyond the third molar. 46.2 percent of the GPF was directed forward and medially, whereas 41.3 percent was directed forward, and 12.5 percent as directed forward and laterally.The present study indicated that the location of the GPF was more variable than is implied in the anatomy textbooks. The perpendicular distance of the GPF in Indian skulls was about 15 mm, the distance of GPF to incisive fossa was approximately 37 mm and the GIM angle was 21 degrees.

Pattern of dyslipidemia in chronic kidney disease

(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (5), pp. 899-905.

[a] Sree Balaji Medical College and Hospital (Bharat University), No. 7, Works Road, Chrompet, Chennai, Tamil Nadu, 600044, India
[b] Madras Medical College and Government General Hospital, E.V.R Periyar Salai, Park Town, Opp. Cent. Railway Station, Chennai, Tamil Nadu, 600003, India

Abstract
Chronic Kidney Disease is one of the major causes leading to mortality and morbidity and its incidence and prevalence is also on the uptrend. One of the leading cause for death in stage 5 CKD patients is secondary cardiovascular problems associated with natural history of disease process. The aim of this study is to study the pattern of dyslipidaemia in patients suffering from chronic disease. In this study, 100 Chronic Kidney Disease patients attending the outpatient department or admitted in Rajiv Gandhi Government General Hospital were taken up for the study. This study revealed that there was a progressive increase in triglyceride and total cholesterol levels and a decrease in the levels of high density lipoproteins in patients suffering from Chronic Kidney Disease.

Biometric IRIS recognition based age estimation in security systems
(2015) *International Journal of Applied Engineering Research*, 10 (15), pp. 35530-35536.

[a] Department of Electronics and Communication Engineering, St. Peter's University, Chennai, Tamilnadu, India
[b] Department of Electronics and Telecommunication Engineering, Bharath University, Chennai, Tamilnadu, India

Abstract
Most of the researcher mainly focused on human face image used to identify the face recognition and also used to calculate age estimation. Here we are mainly focusing and using the human Iris images. Iris recognition presents a challenging problem in the field of image analysis and computer vision, and as such has received a great deal of attention over the last few years because of its many applications in various domains. Iris recognition is an important role for playing security purpose. This kind of application is mainly used for banking services, database access and login, ATM services and so on. In this paper first we consider the human Iris image these images it may be static, dynamic, still, and video image. Images may be stored in CASIA iris database it will also work for UBIRIS. First we exactly identify and check the Authentication using GLCM algorithm. Above the images already stored in database or real time. Suppose I give some iris images in real time our software exactly identify and recognize that person is valid or not. Our system consistently achieved a nearly perfect recognition rate (over 99.7% on all databases). © Research India Publications.

A new re-encryption scheme with improvised delegation mechanism and homomorphic encryption
(2015) *International Journal of Applied Engineering Research*, 10 (14), pp. 34485-34489.

[a] Department of Computer Science, Vels University, Pallavaram, Chennai, India
[b] Department of Computer Science and Engineering, Bharath University, Chennai, 600 073, India

Abstract
A cloud storage system is capable of storing huge data in its storage server. The cloud platform consisting of numerous storage servers that render the storage services for long time. Usually the third party acts an admin for the cloud storage system and that does not provide expected data confidentiality. So the centralized cloud storage system is introduced, however it also has the problem of hackers who eavesdrop or attack the data. General encryption schemes protect data confidentiality. In this paper threshold proxy re-encryption scheme and integrate with Fully Homomorphic Encryption is a promising technique for access control of encrypted data. The proxy re-encryption scheme considers the encrypted messages from the data owner and encodes it as well as forwards towards the receiver or storage server. The overall performance achieves the delegation process with secured access control. The simulation results shows proposed system achieves both forward security and backward security in cloud environment. © Research India Publications.

Analysis on capillary pressure curves by wettability modification through surfactants
(2015) *Indian Journal of Science and Technology*, 8 (14), art. no. 70682, . Cited 4 times.

DOI: 10.17485/ijst/2015/v8i14/70682

[a] Department of Petroleum Engineering, Amet University, Chennai, Tamil Nadu, 603112, India
[b] Bharath University, Chennai, Tamil Nadu, 600073, India

Abstract
Wettability of a reservoir rock is closely related to capillary pressure curves. The status of wettability is an important factor for oil recovery, can be clearly seen through the variations in capillary pressure curves. The aim is to analyze the changes in capillary pressure curves and saturations by altering wettability. An oil wet core sample was tested to alter wettability. During alteration process it is difficult to analyze the status of wettability. Surfactants were applied to modify wettability. Additionally, parameters like connate water saturation, spontaneous oil and water saturations, residual oil saturation and type of wettability can be analyzed. The concentration of surfactants was selected by conductivity test. The changes in saturations with variations in capillary pressure curves were stated.

[b] School of Computing, Bharath University, Chennai, Tamil Nadu, 600073, India

Abstract
The aim of this study is based on Survey on fuzzy Petri nets for Classification. Petri Nets (PN) is excellent networks which have great characteristics of combining a well defined mathematical theory with a graphical representation of the dynamic behavior of systems. But, with the growth in the difficulty of modern industrial, and communication systems, PN found themselves inadequate to address the problems of vagueness, and imprecision in data. This gave rise to combination of Fuzzy logic with Petri nets and a new tool emerged with the name of Fuzzy Petri Nets (FPN). Much research has been done for FPN and a number of their applications have been expected, but their basic types and structure is still ambiguous. Result of this research, an effort is made to categorize the applications of FPN for classification according to their structure and algorithms. We identify the different types of Petri nets will improve future research on Petri nets. Hence in this study, due to these limitations we focus on establishing the FPN in the light of their classifications has been done.

Abstract
The present work involves the study of pull-in voltage of MEMS electrostatic Cantilever beam, Fixed-Fixed beam and modified beam structures with perforations of square, rectangular and circular shapes. The analysis is done using COMSOL 4.3 software. The dimensions of the Cantilever beam, Fixed-Fixed beam and three various structured beams modeled in this paper are length = 300 μm, width = 50 μm, thickness = 3 μm and gap between top electrode and ground plane is 2.5 μm. The pull-in voltage obtained for Cantilever beam is 17.6 V and for Fixed-Fixed beam is 118.8 V. For the modified models with square, rectangular and circular perforations are 12.18 V, 15.45 V and 13.75 V respectively. The results of the work demonstrate an ability to achieve lower pull-in voltage levels for three various structured beams modeled in this paper when compared to cantilever and Fixed-fixed beams. The dependence of the pull-in voltage on geometrical parameters, thrusts on stringent design considerations even at the initial stages.

Abstract
The recent trend in photovoltaic inverter is to use topologies with the absence of transformers to acquire higher efficiency. This gives very low ground leakage current. After the elimination of transformer in a grid/Load connected Photovoltaic (PV) system, a galvanic connection exists between the grid/Load and the PV array. The different inverter topology that generates no varying common-mode voltage is proposed to avoid leakage currents, this proposes a new topology with six switches and two diodes that generates no varying common-mode voltage and exhibits high efficiency.

Author Keywords

Abstract
The acquisition of GNSS signal is the most challenging part of any GNSS receiver. With the modernized GNSS system having longer code length and wider bandwidth, the size of the data block becomes large. To reduce the computational load of the processor, the reduction in the size of the data block without compromise in the acquisition loop performance provides overall improvement to the system. Here, a model is developed for acquisition of GPS signal L1 and L2C by compressing the input raw GPS signal with sequences of perfect periodic autocorrelation properties such as the Ipatov sequence. A compression matrix of the required dimension is constructed for compressing the input GPS signal. The improvement in the acquisition performance of the model is discussed.

Improving recovery by altering wettability from oil wet to surfactant wet

(2015) *Indian Journal of Science and Technology*, 8 (11), art. no. 70697, . Cited 2 times.

DOI: 10.17485/ijst/2015/v8i11/71803

Abstract
Surfactants play an important role to alter wettability in any reservoir. Adsorption of surfactants onto reservoir surface will reduce the contact between water and oil which indeed has less impact on Interfacial tension. Oil wet reservoirs are specifically preferred than water wet due to high oil saturation. At the same time extracting oil from oil wet reservoir is difficult due to its wetting nature. The only way to extract oil is by altering wettability from oil wet. The aim of this work is to extract more oil with less adsorption by altering oil wet to surfactant wet. Wettability of sandstone has been chosen to alter from oil wet to surfactant wet. Surfactants of low concentration, which is less than CMC (Critical Micelle Concentration) has been introduced before surfactant flooding during water flooding to make core surfactant wet. The recovery of oil during water flooding is 0.2 Pore Volume (PV). This has been increased to 0.5 pore volume by making it surfactant wet and adsorption has been reduced to 0.5 pore volumes.

Efficacy of external cueing on kinematic gait parameters during a dual motor task in Parkinson's disease
(2015) *International Journal of Pharmaceutical Sciences Review and Research*, 33 (1), art. no. 18, pp. 91-96.

[a] Department of Physiotherapy, Sree Balaji College of Physiotherapy, Bharath University, Chennai, Tamil Nadu, India
[b] SRM University, Chennai, Tamil Nadu, India

Abstract
Dual task walking deficits, impact functional mobility, increases disability, increases risk of fall and leads to decreased quality of life. However the therapeutic intervention in dual task walking has been limited and there is uncertainty about whether clinicians should teach people with Parkinson's disease to avoid dual tasking or whether they should encourage them to practice dual tasking. The purpose of this study is to report the effectiveness of Audio-visual cues that are applied individually in improving the abnormal kinematic gait parameters of the patients with Parkinson's disease and also to investigate the interference of dual task on the walking performance whereby improving the attention of the dual motor task while walking. A quasi experimental study was conducted in a home and rehabilitation setup. A convenient sampling of 30 subjects who fulfilled the inclusion criteria, were randomly assigned into three groups where the groups will receive auditory, visual and audio-visual cueing respectively and each group will undergo single and dual task. Initially, baseline values were taken and after the 4 weeks session post test values were recorded with a 10 meter walk test. This study will examine the role of Audio-Visual cueing that is the combination strategy which helps in the improvement of the kinematic gait variables and also a significant reduction of the interference of the dual task. The improvements shown in the values from pre test to post test, explains the suspected role of cerebellar pathway as an alternative motor pathway. Thus reflecting the need for including dual task walking with the hope to lead an enhanced quality of life and to reduce the amount of disability. © 2015, Global Research Online. Efficacy of external cueing on kinematic gait parameters during a dual motor task in Parkinson's disease
(2015) *International Journal of Pharmaceutical Sciences Review and Research*, 33 (1), art. no. 18, pp. 91-96.

[a] Department of Physiotherapy, Sree Balaji College of Physiotherapy, Bharath University, Chennai, Tamil Nadu, India
[b] SRM University, Chennai, Tamil Nadu, India

Abstract
Dual task walking deficits, impact functional mobility, increases disability, increases risk of fall and leads to decreased quality of life. However the therapeutic intervention in dual task walking has been limited and there is uncertainty about whether clinicians should teach people with Parkinson's disease to avoid dual tasking or whether they should encourage them to practice dual tasking. The purpose of this study is to report the effectiveness of Audio-visual cues that are applied individually in improving the abnormal kinematic gait parameters of the patients with Parkinson's disease and also to investigate the interference of dual task on the walking performance whereby improving the attention of the dual motor task while walking. A quasi experimental study was conducted in a home and rehabilitation setup. A convenient sampling of 30 subjects who fulfilled the inclusion criteria, were randomly assigned into three groups where the groups will receive auditory, visual and audio-visual cueing respectively and each group will undergo single and dual task. Initially, baseline values were taken and after the 4 weeks session post test values were recorded with a 10 meter walk test. This study will examine the role of Audio-Visual cueing that is the combination strategy which helps in the improvement of the kinematic gait variables and also a significant reduction of the interference of the dual task. The improvements shown in the values from pre test to post test, explains the suspected role of cerebellar pathway as an alternative motor pathway. Thus reflecting the need for including dual task walking with the hope to lead an enhanced quality of life and to reduce the amount of disability. © 2015, Global Research Online. Abstract
E-Commerce is the most used technique of buying and selling goods and services online. With the hectic and busy schedule that everyone is going through it becomes very difficult for the consumer to spend time in mails in order to select his or her desired product. At such situation the e-commerce or widely known as the e-business proves to be great help for all of us. With the rising needs of consumer based products and services the need for ecommerce is also increasing in a progressive manner. India has also developed the trend of e-commerce and has emerged out as one of the leading nations to make use of e-commerce for online selling and buying of products. According to EBay's census guide there are around 2.471 e-commerce hubs in our country and the states like Andhra Pradesh, Tamil Nadu, Maharashtra and Gujarat are the most active areas in terms of online trading. The paper aims to discuss about the impact of e-retailing market in India.

Abstract
There have been rapid and extensive changes in the way assessment is conducted in medical education. Assessment brings about standardization of the manner in which the syllabus is to be implemented and also gives guidelines regarding the teaching pattern, especially when the student is going to rotate through various departments in a medical college. Community Medicine is an important branch of medicine concerned with the health of populations. Existing forms of assessment of community medicine education mainly consists of internal [formative] assessment and final (summative) examination. Advantages of the present system is the similarity of the methods used for internal assessments and final examinations and is relatively easily done since only the knowledge application and recall ability of the student in theory and practical are assessed. Disadvantages in the current evaluation system are neglecting the assessment of psychomotor, affective and communication skills. Evaluation systems can be improved by implementing techniques to assess psychomotor skills, presentation and communication skills, organizational skills and the student's ability to work in a team. Regular feedback from students should be taken periodically for the betterment of Community Medicine education. This article is meant to sensitise the academic experts in medical education to plan better need based methods of assessment in the subject of Community Medicine, in relation to the new MCI 2012 Regulations, in order to make it a better learning experience for the students. © 2015, Journal of Clinical and Diagnostic Research. Seizure detection by classification of EEG signals based on DWT reconstruction error and CWT using a novel wavelet

(2015) *Biomedical Research (India)*, 26 (3), pp. 530-533. Cited 2 times.

Abstract
The analysis of EEG signals plays a vital role in the detection of Seizure. The EEG signal of a normal person varies when compared to that of a seizure affected person. A new wavelet is created which closely represents a normal EEG wave. The discrete wavelet transform using the new wavelet family is applied to the input EEG signals. Since the new wavelet represents the normal EEG wave pattern the reconstruction error is very less when a normal EEG signal is applied as an input when compared to that of a seizure EEG signal. This marked difference in the reconstruction error is used to classify the normal and seizure EEG signals. When continuous wavelet transform is applied to the input EEG signal using the new mother wavelet, the wavelet coefficients are higher in seizure EEG when compared to that of the normal EEG signal. © 2015, Scientific Publishers of India. Abstract
Aim of this study is to form a cluster of search results based on similarity and to assign meaningful label to it Database driven web pages play a vital role in multiple domains like online shopping, e-education systems, cloud computing and other. Such databases are accessible through HTML forms and user interfaces. They return the result pages come from the underlying databases as per the nature of the user query. Such types of databases are termed as Web Databases (WDB). Web databases have been frequently employed to search the products online for retail industry. They can be private to a retailer/concern or publicly used by a number of retailers. Whenever the user queries these databases using keywords, most of the times the user will be deviated by the search results returned. The reason is no relevance exists between the keyword and SRs (Search Results). A typical web page returned from a WDB has multiple Search Result Records (SRRs). An easier way is to group the similar SRRs into one cluster in such a way the user can be more focused on his demand. The key concept of this paper is XML technologies. In this study, we propose a novel system called CSR (Clustering Search Results) which extracts the data from the XML database and clusters them based on the similarity and finally assigns meaningful label for it. So, the output of the keyword entered will be the clusters containing related data items. © Maxwell Scientific Organization, 2015.

A study on stress management of the staff of the co operative banks of Tamil Nadu, India
(2015) *International Journal of Pharmacy and Technology*, 6 (4), pp. 7529-7533.

[a] Bharath University, Chennai, India
[b] Dr.M.G.R Educational and Research Institute University, Chennai, India

Abstract
Co Operative Sectors Banking, like other services, has become one of the highly competitive sectors in Tamil Nadu. The Co Operative banking Sectors, since the beginning of this Period of 10 Years, Co Operative banking Sectors has been facing greater challenges in terms of technological revolution, Co Operative service diversification and global banking. Stress is inescapable on the part of the employees as the organization, dealings; techniques are getting complicated with the use of extra ordinary technology. An Every member of staff cannot manage with such rapid changes taking place in the works. This will show the way to coming up of stress among workers. An attempt has been made through this research paper to know the reasons of stress among the Co Operative bank workers and the ways used by employees to manage with the stress generated at place of employment. Stress is found that maximum number of workers in Co Operative banks stay in stress. Greater part of the employees tries to find solution to relieve them from stress in work place. Also the measures are also suggested in the paper to overcome stress that affects their mental health and physical. © 2015, International Journal Of Pharmacy and Technology. All Rights Reserved.

Abstract
In this paper investigation the heat transfer and effectiveness of the double pipe heat exchanger with two flow directions; one is parallel flow and counter flow direction. In these two directions, deem the laminar flow and from the experimental setup in use the exit temperature of both hot and cold fluid with different mass flow rate. Finally work out the heat transfer and effectiveness of the parallel flow heat exchanger and analysis these data with the counter flow heat exchanger. A commercial CFD package, Ansys fluent version are used for this study. Generate and mesh the 3D model heat exchanger. As a final point the experimental assessment is validate with the numerical values. © 2015. International Journal of ChemTech Research. All rights reserved.

Abstract
Web Services is used mainly for the purpose of communicating users of different platform within the network connection. Web Services mainly uses SOA architecture. In this paper we are going to implement web services using Java Spring. Spring is an open-source framework most commonly used development framework for Java. This study is based on how to implement web service and using it in spring applications. I have used Apache Tomcat, Eclipse and spring framework to implement web services. © Research India Publications.

Abstract
This study is focused on the flexural behavior of normally reinforced and prestressed reinforced concrete beams using finite element software(ANSYS)to know their load-deflection reply. Primarily, a survey was done to examine previous experimental and analytical steps related to reinforced concrete components. Secondly, a model that uses ANSYS software was set up and calculated using experimental data. © Research India Publications.

Design of power aware on chip embedded memory based FSM encoding in FPGA

(2015) *International Journal of Applied Engineering Research*, 10 (2), pp. 4487-4496. Cited 233 times.

[a] Department of ECE, Bharath University, Chennai, 73, India
[b] School of Electronics, VIT University, Chennai, India
[c] Department of ECE, Bharath University, Chennai, 73, India

Abstract
A new design methodology to reduce power consumption and minimization of area in FSM based system is fore fronted into FPGA using Finite state machines (FSMs) mapping in this proposed work. This FSM is mapped into the On Chip Embedded Memory (OCEM) through clock gating technique. FSM encoding is stored using OCEM as it reduces the Flip-Flop (FF) and combinational function usage. Clock gating technique will reduce the power consumption additionally through blocking the clock while OCEMP is inidle state. The proposed design is tested and analyzed using ALTERA cyclone II FPGA for Arithmetic Logic units(ALU), Advanced Encryption Standard core (AES), SRAM controller and Synchronous FIFO. OCEM based implementation of One- Hot encoding is performed and compared with conventional Flip-Flop based One-hot encoding and analyzed.The FSM implemented using proposed method consumes less power and fewer areas when compared with FF based FSM implementation or using binary encoding technique. The OCEM based implementation can be clocked to maximum clock frequency. Experimental results and analyses shows that OCEMbased FSM consumes 4 to 26% less power than FF based techniques. © Research India Publications.

Comparative study of validity indices for clustering over ill-structured datasets
(2015) *International Journal of Applied Engineering Research*, 10 (1), pp. 1879-1890. Cited 1 time.

[a] Research Scholar, Department of Computer Science and Engineering, Bharath University, Selaiyur, Chennai, Tamilnadu, India

Abstract
This paper discusses and compares the various validity measures of clustering over ill-structured datasets. The dataset used in this experiment comes from the daily measures of sensors in a urban waste water treat-ment plant. This paper addresses an important issue of clustering process regarding the quality assessment of the clustering results. and also an at-tempt has been made to optimize the results. In this paper, internal clus-ter validity indices like Xie-Beni index, Dunn index, silhouette index have been used to validate the clusters and the optimization of clustering is ex-pressed in terms of number of clusters which result in a natural categoriza-tion of the dataset based on the quality parameters of the water. K-means algorithm is used for clustering the data set considering its simplicity and efficiency. Also K-Means algorithm is one of the most suitable algorithm for clustering numerical datasets. © Research India Publications.

Descend Traversal Prioritization and Ascend Traversal Abstraction based data anonymization over Big Data
(2015) *International Journal of Applied Engineering Research*, 10 (2), pp. 2979-2994. Cited 4 times.

[a] Bharath University, India
[b] St.Joseph's College Of Engineering, Chennai, TamilNadu, India
[c] Department Of Computer Science and Engineering, St.Joseph's College Of Engineering, Chennai, TamilNadu, India

Abstract
Data security, in a Big Data application, is a standout amongst the most concerned issues that preparing huge-scale-protection-delicate data sets frequently obliges calculation assets provisioned by open cloud administrations. Sub-tree information anonymization is broadly used plan to anonymize data sets for protection and safeguarding. Descend Traversal Prioritization (DTP) and Ascend Traversal Abstraction (ATA) is two approaches that are designed to satisfy sub-tree anonymization. Be that as it may, existing methodologies for sub-tree anonymization such as Top – Down Specification (TDS) and Bottom – Up Generalization (BUG), miss the mark regarding parallelization capacity, in this manner, needs adaptability in taking care of Big Data in cloud. Still, either DTP or ATA separately experiences poor execution for certain esteeming of k-anonymity parameter. In this paper, we propose a hybrid approach that joins DTPand ATA together for efficient sub-tree anonymization and for the effectiveness in the applications of Big Data. Further, we plan MapReduce calculations for the two segments (DTP and ATA) in addition to achieve high versatility. Test assessment shows that the hybrid approach altogether enhances the versatility and efficiency of sub-tree anonymization plot over existing methodologies. © Research India Publications.

Maximum demand control using Ad-hoc network to avoid grid failure
(2015) *International Journal of Applied Engineering Research*, 10 (1), pp. 1439-1448.

[a] Bharath University, chennai, India
[b] Saveetha Engineering College, Thandalam, Bharath University, Chennai, India

Abstract
Controlling and monitoring the electrical grids from theft of power and high usage of power than the allotted is difficult and hard. Considering the above problem, a real time system using wireless sensor network is designed that detects when a user crosses the load limit or a theft occurs in the power line. Power can be distributed more efficiently to industries without crossing the load demand. The maximum load usage is specified by the Electricity board - EB according to which this system is designed. Each current transformers and potential transformers are incorporated with the developed system and if in any line, more than the specified power is drawn then a buzzer is set and will turn off till the user reduce the power consumption. The same will be alerted to the electricity board about the power violation. If the load usage is not reduced by the user after the buzzer is set, then the particular line that overdraws power will be shut down and an alert will be sent to the EB office about the same preventing the shutdown of the whole system. © Research India Publications.

Abstract
Sentiment analysis has developed rapidly in recent years as the internet usages have reached successful growth among people. Only few studies have focused on the field of transportation even that failed to meet strict requirements of safety, efficiency and information exchange of ITS (Intelligent Transportation System). To overcome the problem, TSA (Traffic Sentiment Analysis) system is used. The TSA treats the traffic problems in newer angle. A technique called keyword extraction is proposed in this paper. Our work will be helpful in the development of TSA. © Research India Publications.

Evaluation of statistical study of droplet fragmentation in CI engine under lower injection velocity
(2015) *International Journal of Applied Engineering Research*, 10 (3), pp. 7765-7776. Cited 1 time.

[a] RMK College of Engineering and Technology, Dept of Mechanical, Chennai, India

[d] Bharath University, Department of Mechanical, Chennai, India

Abstract
In CI Engines the fuel droplet fragmentation plays a vital role for better mixing of fuel and air inside the combustion chamber. The droplet split-up takes place under various aerodynamic factors such as flow of air, pressure inside the combustion chamber, and the speed of the fuel injected etc., The above factors decide the fragmentation types such as: (i) Vibrational fragmentation; (ii) Bag fragmentation; (iii) Shear fragmentation; and, (iv) Explosive fragmentation. In this work we aim to simulate the fragmentation of a single droplet due to a change in injection velocity and chamber pressure keeping the square root of ratio of density of fuel to that of air a fixed at 22.42. A CFD package of commercial fluent with volume of fluid formulation is used. For the simulation, a triangular cell with approximately 13500 cells is used. A standard k-ε is solution for the scheme. For both momentum and volume of fluid computations the pressure velocity coupling uses the SIMPLE algorithm and second order upwind scheme is used. Gathered results show the different methods to split a single droplet. To understand better the various aerodynamic interactions with the fuel droplet numerical simulation comes for help. In better designing of parameters like injection pressure, chamber pressure etc., without the need for an expensive experimental setup numerical simulation guides. © Research India Publications.

Carpal tunnel syndrome

(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (2), pp. 619-622.

[a] Department of Anatomy, Sree Balaji Medical College and Hospital, Bharath University, Chrompet, Chennai, Tamil Nadu, India

Abstract
Carpal tunnel syndrome (CTS) is a median entrapment neuropathy that causes paresthesia, pain, numbness, and other symptoms in the distribution of the median nerve due to its compression at the wrist in the carpal tunnel. The mechanism is not completely understood but can be considered compression of the median nerve traveling through the carpal tunnel. It appears to be caused by a combination of genetic and environmental factors. Some of the predisposing factors include: diabetes, obesity, pregnancy, hypothyroidism, and heavy manual work or work with vibrating tools. There is, however, little clinical data to prove that lighter, repetitive tasks can cause carpal tunnel syndrome. Other disorders such as bursitis and tendinitis have been associated with repeated motions performed in the course of normal work or other activities. 30 years women came to my clinic for infertility evaluation.Her husband semen analysis is normal.After detailed investigation in chennai government hospital she diagnosed as carpal tunnel syndrome.We are discussing the details of this syndrome in this article.

Seizure detection using wavelet packet analysis and density estimates of EEG signals using a novel wavelet
(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (2), pp. 1930-1934. Cited 1 time.

[a] Sathyabama University, Tamil Nadu, India
[b] St.Peters College of Science and Technology, Tamil Nadu, India
[c] Sree Balaji Medical College and Hospital, Tamil Nadu, India

Abstract
Wavelet packet analysis is an effectual means for the analysis of EEG signals for epileptic seizure detection. In this paper a new wavelet named as 'eegwav' which carries the likeness of an EEG wave pattern is used as the original wavelet. The statistical contents of the wavelet packets are analyzed to tell apart the seizure and seizure free EEG signal. The density estimate of the signal is also obtained using the mother wavelet 'eegwav'. The wavelet based density estimator utilized here is the histogram analysis using hard thresholding technique.

Abstract
The presence of obesity, hyperandrogenism, hyperinsulinemia, hirsutism, polycystic ovaries are well established features in PCOS subjects. The adolescence girls experience menstrual irregularity in first five years after menarche. The purpose of this study is to analyse the status of lipid profile and leptin at the end of hypothalamo hypophyseal maturation that is eight years after menarche. The subjects in this study includes two groups. Group 1 includes regularly menstruating adolescence girls and group 2 includes irregularly menstruating girls. Student t test was performed to analyse the test of significance between the two groups. The mean value for leptin, total cholesterol and triglycerides were statistically significant between the two groups. This study suggest that the status of adiposity marker that is leptin in irregularly menstruating adolescence girls precede towards the aetiogenesis of PCOS in later adulthood life.

Positive stress and its impact on performance

(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (2), pp. 1519-1522. Cited 2 times.

[a] Dr. M.G.R Educational, Research Institute University, Chennai, Tamil Nadu, 600095, India
[b] Sree Balaji Medical College and Hospitals, Bharath University, Chennai, Tamil Nadu, 600044, India

Abstract
This paper aims at throwing light on the positive stress also called 'Eustress' and its impact on one's performance level. Researches have shown that a certain amount of stress is needed for an increased performance. Eustress fills us with thrill and excitement whenever we are confronted by a demanding situation. As eustress improves our concentration and makes us more enthusiastic to perform the work. Hence positive stress is essential for bringing zeal to the life; it is healthy, useful and beneficial. When stress becomes too much in a given situation it becomes harmful for us because we are unable to cope up with the situation. This is actually referred to as 'stress' and it is negative stress (distress). Thus at one level stress may deter the performance. There are three aspects of stress-physical, mental and psychological. In all the three types both positive and negative effects are noted. We must possess the knowledge in finding out the signs and warning symptoms of stress. It is also necessary to learn the stress management steps and to follow them to counter stress.

Abstract
Zinc oxysulfide quantum dots have been attracting increasing research interest due to their tunable electronic, optical and magnetic properties. In this paper we report the green synthesis of zinc oxysulfide quantum dots in the range of a few nanometers using aegle marmelos fruit extract through a facile precipitation route. The zinc oxysulfide quantum dots (ZOS QDs) were characterized by X-ray diffraction, ultra violet-visible absorbance spectroscopy, photoluminescence spectroscopy, energy dispersive X-ray spectroscopy, transmission electron microscopy, and vibrating sample magnetometry. Energy dispersive X-ray spectroscopy of the synthesized samples indicates that 16% oxygen is incorporated into the zinc sulfide crystal lattice that results in an optical band-gap transformation from direct type for the zinc sulfide cubic phase to a decreased bandgap of 3.46 eV. The vibrating sample magnetometer analysis results showed the existence of room temperature ferromagnetism (RTF) in zinc oxysulfide quantum dots. The bandgap engineering approach adopted in this work to tailor the optical and electronic properties of zinc sulfide with the RTF magnetic properties of zinc oxide will have a significant impact on the development of ternary chalcogenides for magnetic and photonic applications. The prepared ZOS QDs exhibit good cell viability with HeLa cells and the toxicity results obtained from this research work provide a new direction for the development of nontoxic bandgap engineered ZOS based QDs for biological applications. To the best of our knowledge, this is the first report on the biocompatibility of novel ZOS QDs in HeLa cells. This journal is © The Royal Society of Chemistry 2015.

Abstract
Versatile, cost effective and simple method of preparing ZnO nanocrystals was reported. Organometallic precursor derived ZnO nanocrystals were structurally possessed the hexagonal wurtzite structure with lattice constants a=3.249Å, c=5.206Å and the properties are strongly dependent on pH was also inferred. The morphological analysis was in accordance with the DLVO theory as supports the pH dependent aggregation of nanocrystals. The HR-TEM analysis confirmed the nanophase formation of the end product with an average particle sizes ranged from 10 to 35 nm. The peak shift in the band edge absorption towards the lower region tendency varied with varying pH of the growth environment and the increased band gap supplemented the nanophase nature of ZnO. The FT-IR analysis showed the existence of superfluous water and CO2 molecules on the ZnO nanocrystals. The present study concluded the pH dependent growth of ZnO related materials. © 2015, International Journal of ChemTech Research. All rights received.

Evaluation of primary bone tumors with plain radiograph, CT, MR and correlation with surgical and histo-pathological findings

(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (1), pp. 699-705.

[a] Department of Radiology, Chettinad Hospital and Research Institute, Kelambakkam, Chennai, Tamil Nadu, India
[b] Department of Pathology, SreeBalaji Medical College and Hospital, Chromepet, Chennai, Tamil Nadu, India

Abstract
Bone tumors may be benign or malignant. The need for accurate preoperative local staging techniques to allow planning of limited or limb-saving surgery in patients with primary bone sarcoma has fostered an interest in radiologic staging techniques. The modalities used in analyzing bone tumors include: a) conventional radiography, b) computed tomography (CT), c) magnetic resonance imaging (MRI) andd) surgical/histo-pathological examination. In this study, the role of imaging modalities and various MRI sequences in evaluating primary bone tumors were analysed. 1) To compare the role of plain radiograph, CT and MRI in the evaluation of bone tumors and correlate with the surgical and histo-pathological findings. 2) To determine the role of various MR sequences in primary bone tumors. In this five year study, 50 patients who had strongly suspected (clinically or radiographically) primary malignant neoplasm arising from bone underwent the following procedures: Plain radiograph, CT and MR. All the imaging findings were recorded and compared with the surgical/histopathological examination. Statistical analyses were made with IBM SPSS software version 20.0. Conventional radiography yielded the most useful information about the location and morphology of a lesion, whereas, CT was excellent in demonstrating the type of bone destruction, calcifications, ossifications and periosteal reaction and MRI was crucial in the evaluation of intraosseous and extraosseous extensions of a tumor. Both MRI and CT have advantages and disadvantages, and circumstances exist in which either can be the preferential or complementary study.

Morphology and morphometric analysis of parotid gland

(2015) *Research Journal of Pharmaceutical, Biological and Chemical Sciences*, 6 (1), pp. 332-335.

[a] Department of Anatomy, Sree Balaji Medical college, Bharath University, Chrompet, Chennai, Tamil Nadu, India
[b] Department of Anatomy, Madras Medical College, Chennai, Tamil Nadu, India

Abstract
The parotid gland is the largest of the salivary glands and secretes saliva via the parotid duct into the oral cavity to facilitate mastication and swallowing. It is located in the parotid space. The parotid gland is wrapped around the mandibular ramus and extends to a position anterior and inferior to the ear within the parotid facial space. Morphology and Morphometric analysis of parotid gland were done in Department of Anatomy, Madras Medical College, Chennai. This valuable data is more useful in maxillofacial surgeries like parotid, gland surgery, parotid duct surgery and some facial cosmetic surgeries.

Abstract
Children are more likely to have foods that are easily available and they tend to eat greater quantities when larger portions are provided. Additionally, characteristics of the social environment, including various socioeconomic and socio -cultural factors such as parents' education, time constraints, and ethnicity influence the types of foods children eat. children's consumption of fruits and vegetables (from seven day food records) was related to home availability and accessibility (as assessed by a parent telephone interview), after controlling for psychosocial characteristics. Mealtime structure includes social and physical characteristics of mealtimes including whether families eat together, TV-viewing during meals, and the source of foods (e.g., restaurants, schools)., children ate more fruits and vegetables for lunch at schools that offered more fruits and vegetables for lunch, after controlling for socioeconomic status. Parents also play a direct role in children's eating patterns through their behaviors, attitudes, and feeding styles. Interventions aimed at improving children's nutrition need to address the variety of social and physical factors that influence children's eating pattern.

Author Keywords
Childhood obesity; Complications; Family and Social determinants; Preventive measures

Index Keywords
cholesterol; adverse outcome, asthma, causal attribution, child, child behavior, disease association, eating habit, emotional disorder, exercise, family history, family interaction, family life, food quality, human, hypertension, lifestyle, menstruation, metabolic syndrome X, non insulin dependent diabetes mellitus, nonalcoholic fatty liver, obesity, psychological aspect, puberty, Review, risk factor, social aspect, social status, social stress, Article, body fat, body weight, bullying, caloric intake, childhood obesity, cholesterol diet, depression, dietary intake, environmental factor, family attitude, feeding behavior, food intake, fruit, learning disorder, nutrient availability, puberty disorders, self esteem, sleep disorder, social determinants of health, vegetable, wellbeing

Chemicals/CAS
cholesterol, 57-88-5
