 Bharath Institute of Higher Education and Research,
 Chennai.

Sub: Permission to conduct value-added course: FULL MOUTH REHABILITATION

Dear Sir,

With reference to the subject mentioned above, the department proposes to conduct a value-added course titled: **FULL MOUTH REHABILITATION** on 30.6.18 . We solicit your kind permission for the same.

Kind Regards

DR.BALAJI SUBRAMANIAN

FOR THE USE OF DEANS OFFICE

Names of Committee members for evaluating the course:

The Dean: DR SUGUMARAN

The HOD: DR. BALAJI SUBRAMANIAN

The Expert: DR AMUTHAVALEE

The committee has discussed about the course and is approved.

Sub: Organising Value-added Course: FULL MOUTH REHABILITATION reg

With reference to the above mentioned subject, it is to bring to your notice that SRI LAKSHMI NARAYANA INSTITUTE OF MEDICAL SCIENCES, Bharath Institute of Higher Education and Research, is organising "FULL MOUTH REHABILITATION". The course content and registration form is enclosed below."

The application must reach the institution along with all the necessary documents as mentioned. The hard copy of the application should be sent to the institution by registered/ speed post only so as to reach on or before 26.11.18. Applications received after the mentioned date shall not be entertained under any circumstances.

DEAN
RAGHUNATHAN R/710410 (AUG 2013)
OSSOOU, AGARAM VILLAGE,
KUDAPAKKAM POST,
PUDUCHERRY - 605 502.

COURSE PROPOSAL

Course Title: FULL MOUTH REHABILITATION

Course Objective: To enlighten students about significance of full mouth rehabilitation

Course Outcome: In depth knowledge regarding full mouth rehabilitation

Course Audience: MBBS STUDENTS

Course Coordinator: DR.BALAJI

Course Faculties with Qualification and Designation:

I. DR.AMUTHAVALILV M.D.S & ASSISTANT PROFESSOR

Course Curriculum/Topics with schedule (Min of 30 hours)

| S.No | Date | Topic | Time | Hours |
|------|---------|---------------------------------|-------------|-------|
| 1. | 3.6.18 | Vertical height | 4PM-7PM | 3 hrs |
| 2. | 13.6.18 | Facial profile | 4pm-7 pm | 3hrs |
| 3. | 22.6.18 | Attrition of teeth | 5pm-8pm | 3 hrs |
| 4. | 30.6.18 | Replacement of missing anterior | 4pm-7pm | 3hrs |
| 5. | 3.7.18 | occlusion | 5pm-8pm | 3 hrs |
| 6. | 11.7.18 | Vertical dimension | 5pm-8pm | 3 hrs |
| 7. | 23.7.18 | Full mouth rehabilitation | 4pm-7pm | 3 hrs |
| 8. | 30.7.18 | Fixed prostheses anterior | 5pm-8pm | 3 hrs |
| 9. | 10.8.18 | Semi adjustable articulator | 5pm-8pm | 3 hrs |
| 10. | 18.8.18 | Metal ceramic crowns | 4pm-7pm | 3 hrs |
| | | | Total Hours | 30 |

ABSTRACT

Restoration of occlusion in patients with severely worn dentitions is a challenging situation as every case is unique in itself. There is great apprehension involved in reconstructing debilitated dentition due to widely divergent views concerning the choice of an appropriate occlusal scheme for successful full mouth rehabilitation. This article is an overview of the various occlusal concepts/philosophies in full mouth rehabilitation which will help the clinician select an appropriate occlusal scheme for an individual case.

The objective of full mouth rehabilitation is not only the reconstruction and restoration of the worn out dentition, but also maintenance of the health of the entire stomato gnathic system. Full mouth rehabilitation should re-establish a state of functional as well as biological efficiency where teeth and their periodontal structures, the muscles of mastication, and the temporomandibular joint (TMJ) mechanisms all function together in synchronous harmony. Proper evaluation followed by definitive diagnosis is mandatory as the aetiology of severe occlusal tooth wear is multifactorial and variable. Careful assessment of the patient's diet, eating habits and/or gastric disorders, along with the present state of occlusion is essential for appropriate treatment planning. Various classifications have been proposed to classify patients requiring full mouth rehabilitation, however, the classification most widely adopted is the one given by Turner and Missirlian. According to them, patients with occlusal wear can be broadly classified as follows: Excessive wear with loss of vertical dimension of occlusion (VDO) The patient closest speaking space is more than 1 mm.

FULL MOUTH REHABILITATION

Occlusion is a factor that is common to all branches of dentistry. It is a term generally accepted to describe the contact relationship of the upper and lower teeth. Teeth whether natural or artificial are not immobile; so occlusion can never be considered a purely static relationship. Natural teeth move in their socket and change perceptibly from day to day. They move under load into their sockets and return to position when the load is removed. Artificial occlusion discloses even more apparent movement, since the teeth move as a group on a common base because of the nature of the supporting structures.

There are numerous concepts, techniques and philosophies concerning complete denture occlusion. Keeping abreast with the changes in this area is a challenging task. Some prosthodontists believe that there should be cusps on the artificial teeth and that they must be in harmony with the dynamics of mandibular functions. Other prosthodontists think that the artificial teeth should not have cusps because they create forces that are difficult to control.¹

THEORIES AND CONCEPTS

Occlusion according to glossary of prosthodontic terms 8th ed, is defined as "the static relationship between the incising and masticating surfaces of the maxillary or mandibular teeth or teeth analogues."²

Articulation is another terminology that deals with occlusion. It is the dynamic relationship or relationship in function of the maxillary and mandibular teeth.

Occlusion of natural and artificial teeth varies to a great extent. It is important for one to know about these differences in order to understand the need of balanced occlusion in a complete denture.

The first description of occlusal relationship of the teeth was made by Edward Angle in 1899. Occlusion became a topic of interest and much discussion in the early years of dentistry as the restorability and replacement of teeth became more feasible. The first significant concept developed to describe optimum functional occlusion was called balanced occlusion.

The primary components of human dental occlusion are

- (1) The dentition.
- (2) The neuromuscular system, and

(3) The craniofacial structures.

The development and maturation of these components are interrelated so that growth, adaptation, and change actively participate in the development of an adult occlusion. Dentition development is characterized by a period of dental alveolar and craniofacial adaptability, which is also a time when motor skills and neuromuscular learning are developing. Clinical treatment at this time may take advantage of such responsive adaptive mechanisms; for example, teeth can be guided into their correct alignment by orthodontic treatment.

In a healthy adult dentition, dental adaptive mechanisms are restricted to wear, extrusion, and drifting of teeth. Bony adaptations are essentially of a reparative nature and are slow in their operation. Protective reflexes are learned so one can avoid pain and inefficiency of the masticatory system. If and when an adult dentition begins to deteriorate, the prosthodontist resorts to fixed or removable prosthodontic therapy in attempts to maintain a functional occlusal equilibrium. This period is characterized by greatly diminished dental and reflex adaptation and by bone resorption.

Obviously, the presence of tooth loss and disease and the depletion of reparative processes pose a major prosthodontic problem. Finally, in the edentulous state, there are few natural adaptive mechanisms left. The prosthesis

rests on tissues that will change progressively and irreversibly, and the artificial occlusion serves in an environment characterized by constant change that is mainly regressive. The modern complete denture service is characterized by an integration of biological information with instrumentation, materials and clinical techniques. Orofacial and tongue muscles play an important role.

VALUE ADDED COURSEFULL MOUTH REHABILITATION

ANSWER ALL THE QUESTIONS

1. Anterior facial height?
2. Attined posteriors?
3. Supra-erupted anterior?
4. Lip line?
5. Goll chin?

Full Mouth Rehabilitation.

Definition:

The restoration of the functional integrity of the dental arches by the use of inlays, crowns, bridge and partial dentures.

Full mouth rehabilitation:

Restoration of the form and function of the masticatory apparatus to as near a normal as possible. (optimal)

Objectives of full mouth Rehabilitation:

- All patients requiring full mouth rehabilitation have one problem in common) Stress and strain.
- usually the stress is due to malfunction or poorly related parts of the oral mechanism.

Reasons for full mouth Rehabilitation:

- common reason for doing full mouth rehabilitation is to obtain and maintain the health of previously healthy teeth.

Temporo mandibular joint dis.

FP-1 - woven

FP-2 woven and portion of root

FP-3 - Replacing woven, root with soft tissue.

RP-4 - Two plane Support

RP-5 - Implant & soft tissue support.

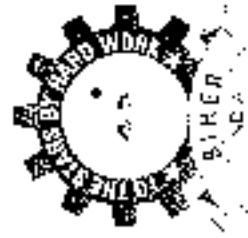

Misch Classification

D₁ - Dense Cortical.

D₂ - porous cortical, trabecular.

D₃ - porous cortical and fine trabecula.

D₄ - fine trabecula.

Sub: Completion of value-added course: FULL MOUTH REHABILITATION

Dear Sir,

With reference to the subject mentioned above, the department has conducted the value-added course titled: **FULL MOUTH REHABILITATION** on 18.8.18 . We solicit your kind action to send certificates for the participants, that is attached with this letter. Also, I am attaching the photographs captured during the conduct of the course.

Kind Regards

DR.BALAJI SUBRAMANIAN.R
